6831. But does it in operation with the operation with the Government; the Governor General in himself in Council cannot be expected to go into all these details; whose duty is it to examine closely into the details of revenue and expenditure, and see that the revenue is as large as it ought to be, and that the expenditure is not greater than it ought to be?—The administrative

head of this particular department is, as I have stated, the Commissary General.

6832. But I understand that the department is distinctly under his management; he spends the money, and he directs it?—He is responsible to the Government for his management in every particular.

6833. *Mr. Crawford.*] I think you misunderstood a question which I put to you the other day, when I asked you whether the Bank of Bengal received any payments from the Government in respect of the services which it rendered to the Government as its bank; you said that it received none at the present time?—My answer was not quite correct. There is no payment made at the present time in regard to the services performed at the newer branches of the Bank of Bengal; but the sum of 43,000 rupees is paid to the bank for the management of the business of the general treasury in Calcutta.

6834. The Bank of Bengal accords then to the Government at its branches, the same banking advantages which the bank itself does to the Government at Calcutta?—That is so.

6835. So that when money has to be transferred from one branch to another branch, the Bank of Bengal is not instrumental in rendering the Government services in that matter?—Such transfer may be made through the agency of the bank, but the bank does not undertake to place the funds wherever required; that is no part of the duty for which the payment referred to is made.

Lieutenant Colonel GEORGE CHESNEY, R.E., called in; and Examined.

6836. *Chairman.*] WHAT has been your occupation in India?—I have been Accountant General, and in charge of the accounts of the Public Works Department from 1861 to 1870.

6837. You will observe that in the accounts laid before Parliament for 1869–70, there is an item appearing of “Public Works, Miscellaneous,” 957,714 *l.*, will you be good enough to inform the Committee of what that item is composed?—It is composed of three main items; first, Miscellaneous Receipts, 173,478 *l.*; next, water rent from Irrigation Works, 530,656 *l.*; and thirdly, Railways, gain by exchange, 253,580 *l.*; Grand Total 957,714 *l.*

6838. Can you explain more in detail what the miscellaneous receipts are?—The miscellaneous receipts are divided into four classes; first, “Tolls, Fees, Fines, and Refunds.”

6839. How much is that item?—I am unable to give the total of that; the return from one province is wanting, so that I am unable to give the total for the whole of India; but with the exception of that province, the return is here.

6840. Will you give us that and the name of the excepted province?—The excepted province is Madras; the information is readily obtainable, but I have not got it here. That item would be about 60,000 *l.* altogether.

6841. Will those be tolls and fees received by the Government for the use of certain works, ferries, roads, or what?—I should explain that by far the greater part belongs to the head “Refunds,” and is principally a matter of account, being a credit on account of charges raised against local funds. Where a service has been

performed by the Government of India on behalf of a local fund, a charge has been raised against the local fund and the credit given to the Imperial funds. The tolls and the fees are a very small part of the whole.

6842. What is the next item?—The next is “Rents of Lands and Buildings;” the amount is about 50,000 *l.* Those are buildings including military quarters occupied by officers or by civilians; Government quarters rented by them, and any lands held by the Government, and let for rental.

6843. You mean in the occupation of the Works Department, who re-let or otherwise make a profit of them?—Yes; but the main item is rents from officers occupying Government quarters.

6844. Is that rent derived from officers of the Government generally, or from officers of the Works Department?—From officers of the Government generally; mainly from officers of the army.

6845. Then do we rightly understand that for this purpose all the buildings which are in the nature of residences or otherwise are put in charge of the Works Department, and that in some cases they charge rent for the use of them?—In almost all cases rent is charged, and it is recovered and brought to credit by the Works Department.

6846. What is the next item?—The next item is “Sales of Produce;” principally the sale of grass on the Government embankments; occasionally crops of grass are sold elsewhere; the total amount is between 5,000 *l.* and 6,000 *l.* The fourth item is, “Sales of Buildings and Plant;”

S s

Lieut. Col.
G. Chesney,
R.E.

Lieut. Col.
G. Cheesey,
R.E.

13 June
1871.

that will be about 25,000 *l.* That makes the whole amount in round numbers.

6847. Is that last item one of ordinary regular occurrence, or exceptional for the year?—It occurs every year; in this particular year it was exceptionally large; there were some sales of buildings in Bombay to the amount of 20,775 *l.*, which, I believe, speaking from memory, arose from a transfer to the Bombay Port Trust Fund of certain public buildings.

6848. Mr. Crawford.] To the Bombay Municipal Trust?—To the Bombay Port Trust, a new trust created under a special Act of the Legislative Council; that was an exceptionally large sale.

6849. Chairman.] Now, proceeding to the next item of water rents and irrigation, is that 530,000 *l.* considered to be the regular rental for the year?—The rental is gradually expanding, but in the year 1869-70 the rent in the North West Provinces of the canals there was exceptionally large, owing to the drought in the previous season.

6850. Do you know what the increase was in that year over the previous year?—In the previous year the rents for the North West Provinces were 259,230 *l.*; in this year, 1869-70, they were 324,198 *l.*, showing an increase of about 64,000 *l.*

6851. Are these the gross receipts without any deduction whatever for expenditure for the canal irrigation works?—Without any deduction.

6852. Would that expenditure appear on the other side of the account?—It appears on the other side of the account; I may state that the total amount of this 530,000 *l.* is made up thus: irrigation revenue in Bombay, 2,138 *l.*; in Bengal, 5,487 *l.*; in the North Western Provinces, 324,198 *l.*; and in the Punjab, 198,533 *l.*

6853. Will you tell us what the chief heads of receipt are that will make that income in the North Western Provinces so much larger than from Bombay and other Presidencies?—I should explain that originally the Government derived no direct revenue from irrigation works. When first the British assumed the government of the country they found that it was the custom of the native rulers to maintain the irrigation works, such as existed, in repair at their own cost, either by forced labour or by paid labour, recouping themselves through the assessment on the land. This was the plan adopted by the British Government in Southern India where irrigation works were first established, and has been maintained up to the present time. The first beginning of a direct revenue from irrigation works in the form of a water rate was on the occasion of the construction of some canals in the North West Provinces, where the assessments being for a long term of years it was impossible to obtain an increased revenue indirectly from them, and a water rate was consequently established there. That practice was followed in the Punjab; it has now also been followed in Bengal with respect to the new irrigation works there, and has been commenced in Bombay with the new irrigation works lately set on foot in that province.

6854. Then as to the smaller sum which you first mentioned, where was that derived from?—The small sum in Bombay is derived from one or two works which have lately been constructed. In

Bengal the revenue, also small, is mainly derived from the Orissa irrigation work, which was purchased by the Government about two years ago.

6855. You did not tell us what particular works there are in the North West Provinces?—The greater part of the revenue is derived from the Ganges Canal, and about one-third of the 324,000 *l.* from another canal from the Jumna. In the Punjab 198,000 *l.* is derived equally from two great canals which each contribute one-half of that. The four provinces above named are the only four which as yet give any direct irrigation revenue.

6856. Is this charge now for irrigation made by an Act of the Legislative Council, or by the order of Government?—It is made under the authority of an Act of the Legislative Council.

6857. Is the tariff fixed in the Act, or by the order of the Government?—I think a maximum tariff is prescribed in the Act; but I am not quite certain upon that point.

6858. Is the receipt from sums paid by those who voluntarily take the water, or is it a compulsory rate?—It is entirely voluntary. The rate amount is determined by the extent of the land irrigated every year.

6859. The party takes as much as he likes?—Yes, if there be sufficient water available, and he pays according to the nature of the crop which is irrigated; the rate varies from about 2 *s.* 6 *d.* an acre to about 10 *s.* an acre, speaking roughly, according to the nature of the crop.

6860. That is on the estimated quantity of water that such a crop will require to bring it to maturity?—Yes.

6861. Do you know whether the whole of the water that is available from these canals when completed is now being consumed, or is there any surplus?—On the Ganges Canal, which is the largest irrigation work, the supply of water is, generally speaking, not equal to the demand of the cultivators.

6862. So that that canal may be said to be in full working order, its powers fully taxed?—Yes.

6863. And what is the case with regard to the other canals?—With the exception, I think, of the great canal in the Punjab, which is not quite completed, I believe the others are now in full working order, the water doing its full duty.

6864. What is the estimated revenue from the Punjab canal which is in full working order?—I think it is almost impossible to say that; the demand on the Ganges Canal seems to be steadily rising, not perhaps year by year, because it varies to a certain extent with the harvest, but the general tendency of the revenue is to improvement, and there is no reason to suppose that the same thing will not take place in the Punjab.

6865. However, the quantity of water which that canal will supply is not yet used?—It is not yet fully used, I believe.

6866. With regard to the small work in Bombay, is that the beginning of some work, or a complete one?—That is a very small revenue which will become largely enhanced hereafter. I should mention that the Ganges Canal for some years did not pay its working expenses; the development of irrigation is always a slow process.

6867. Does the Government keep a balance sheet of the annual working of each of these canals?

canals?—A capital and revenue account of every irrigation work is kept and rendered to the Government of India every year. It shows the working expenses, and a charge of 5 per cent. on the capital, and on the other side there is the balance of profit or loss, as the case may be.

6868. Are you able to state to us what the net profit or loss of the principal works is?—The return would require a day or two to prepare; the information is readily available. I may state generally that the Ganges Canal now pays net about $7\frac{1}{2}$ per cent. on the capital, that is after charging all expenses for maintenance and establishment.

6869. Mr. *Fawcett*.] Does that include the amount that you ought to allow, considering the number of years that it did not pay its expenses?—No, the loss of the previous years has been charged off in the accounts of those years.

6870. *Chairman*.] Taking the actual cost without accumulation of interest from past years, then it is $7\frac{1}{2}$ per cent. upon that sum?—Yes.

6871. With regard to the other canals, how does the case stand?—The two canals from the Jumna are, I believe (speaking at this moment from memory, and subject to correction), paying about 17 or 18 per cent. on the capital.

6872. Computed, I suppose, in the same way without charge for interest during construction?—Yes; but I should mention that those two canals paid about 5 per cent. almost from the first commencement, so that in their case there was no accumulated loss to make up. The construction occupied only two or three years, and the canals have been in working order nearly 40, so that the sum lost during construction is but a small item comparatively.

6873. Have you any other canal which you have not mentioned?—The Orissa irrigation work has only just commenced to come into working order.

6874. How long has it been in construction?—I think it took five or six years to construct.

6875. Mr. *Fawcett*.] The Government did not construct that canal; they bought it, did they not?—Yes.

6876. But it was complete when they bought it, was it not?—Partially only.

6877. *Chairman*.] Are you able to give us any estimate of its present net return?—The estimate for the current year for the irrigation works in Bengal is 35,350 *l.* of gross revenue, that is for 1871–72.

6878. At that former period it was not yielding any return, was it?—It was yielding a trifling return.

6879. Can you put in a short statement of the canals, showing their length, the capital, the expenditure, and the number of acres upon which the amount is raised?—Yes. I should explain that the Orissa Irrigation Works are not quite in the nature of canals, and one cannot state their length in the same way as you can with regard to others; it consists of a net-work of navigable canals combined with other irrigation works.

6880. Mr. *Crawford*.] In your return, would you distinguish the navigation tolls from the water rents?—Yes.

6881. *Chairman*.] Then the third heading of this receipt is the gain by exchange on the railway?—Yes, that, however, includes 8,080 *l.* on 0.59.

account of the traffic receipts of the Calcutta and South Eastern Railway.

6882. Will you explain in what way you arrived at the credit of 253,000 *l.* from what you could gain by exchange?—In former years the gain by exchange used to be put against the loss, and the net result only shown in the estimates; in the year 1869–70, the two sums, which really have no connection with each other, were separated in the accounts; this gain represents the difference between the rate at which the Government receive the traffic receipts from the companies in India, and pay them to the shareholders in England; they receive them at 1 *s.* 10 *d.* a rupee from the company, and they credit the Secretary of State at the rate of 2 *s.*, and consequently there is a gain to the Government of India in their accounts with England of 2 *d.* per rupee.

6883. That is to say, the accounts are adjusted at 2 *s.*, and there is a difference of 2 *d.* to be accounted for, which is accounted for in this manner to make the accounts balance?—Yes.

6884. Mr. *Crawford*.] The railway company has charged 1 *s.* 10 *d.*?—Yes.

6885. *Chairman*.] It does not represent the actual operation of exchange, but merely the adjustment of accounts on that principle?—Yes; there is, however, a gain, because the rate of exchange has not for some years been so low as 1 *s.* 10 *d.*

6886. That would be a totally different thing if you enter into the question of an actual remittance?—Yes.

6887. With regard to the last item, the receipts from this railway, is that a railway constructed by the Government or taken over by the Government?—That is a railway purchased by the Government, the railway that runs from Calcutta to Port Canning, on the Mullah, for a length of 24 miles; the Parliamentary title of the railway is the Calcutta and the South Eastern.

6888. That is only the gross receipt?—Those are the gross receipts; the expenditure is shown on the other side of the account.

6889. Is the Government still in possession of that line?—It is still in possession of it; it is being worked by the Eastern Bengal Company, on behalf of the Government.

6890. Do the Government keep a balance-sheet now of that railway?—Precisely of the same kind as that kept of the different railway companies; a half-yearly revenue account and a capital account are kept.

6891. Has the capital actually been paid off?—The capital has been paid to the shareholders.

6892. Mr. *Cave*.] Is the Ganges Canal navigable?—Yes.

6893. Then is that the reason that the water supply is likely to fail, as you say?—Enough water must always be kept in the canal to allow of boats going through, but the canal at the termination where it joins the Ganges is very small, so that the total loss on that account is very inconsiderable.

6894. Where does the water come from to this canal?—It comes from the Ganges, from a dam at the head where the river issues from the mountains; it is there diverted into the canal, and joins the river again at Cawnpore.

6895. And therefore the loss can only be temporary, I suppose?—There is a constant loss going on, so far as that the channel has to be kept open

Lieut. Col.
G. Chesney,
R.E.
13 June
1871.

Lieut. Col. open at the tail of the canal to admit of boats
G. Chesney. passing down into the river.

R.E. 6896. I suppose the source at the other end is
 — quite inexhaustible?—Yes.

13 June 6897. So that it is simply a question of the
 1871. time that boats take to go between one lock and
 another in which the scarcity could arise?—The
 scarcity is not in the navigation; it is in the
 irrigation; in times of drought the canal is not
 able to supply sufficient water for cultivators.

6898. It cannot run quickly enough between
 the locks?—No; the channel is not sufficiently
 large to give off the quantity of water that
 could be sold if it were there.

6899. Is the supply of water for irrigation
 checked; are there lock-gates, for instance?—
 The irrigation is conducted by means of small
 subsidiary channels taken off at intervals from
 the main canal; these again are diverted into
 smaller channels, which open out into the fields
 by means of small gates.

6900. How is the supply checked to the culti-
 vators; mechanically?—There is no mechanical
 check; the cultivator applies to have his fields
 irrigated, and if the water is available the gate is
 opened, and the water is turned on to his field.

6901. And he takes as much as he wants?—
 Yes.

6902. Are the gates opened periodically?—
 No; on application only.

6903. Are the banks of the canal high above
 the country, generally?—Generally.

6904. And I suppose the expense of keeping
 them up is great, is it not?—I think not, com-
 pared with the magnitude of the works; the
 banks are in very good preservation usually.

6905. There is no great pressure of water
 upon the bank?—No; the water is, generally
 speaking, below the level of the country.

6906. Then the bed of the canal is not above
 the level of the country in any case?—It may
 occasionally be so in passing through low ground,
 but generally speaking not.

6907. Is there any pumping?—No.

6908. You spoke of the capital that had been
 lost in former years and had not been accounted
 for; was that absorbed in the annual accounts of
 Indian revenue?—Yes.

6909. Mr. *Crawford*.] The question of profit
 or loss is one of account only, I suppose; that is
 to say, it simply passes through the books of
 the Government and is not brought to credit in
 any way?—No, the gross receipts are shown in
 the general accounts and the gross expenditure.

6910. Has the irrigation from the Ganges or
 in any other canal had any effect upon the public
 health of the district?—That is a moot point;
 some people say that it has, and others say
 strongly that it has not.

6911. What is your own opinion?—I should
 say that the Ganges had usually no pernicious
 influence, but unquestionably some of the older
 canals, mere conversions of old Mahometan
 works, have had a very bad effect indeed.

6912. Causing fevers and malaria?—Yes.

6913. There is a set off in that respect, there-
 fore, against the advantage derived from them?—
 Yes.

6914. The canal does not discharge any water
 into the Ganges at Cawnpore, does it?—There
 is a small quantity running over the weir there,
 just enough to keep the channel open.

6915. With regard to the gain on the ex-

change for the railways, I think you mean this:
 that the net profit received by the Government
 in India for the account of the railway companies
 is accounted for by the Secretary of State here to
 the railway companies at the exchange of 1*s.* 10*d.*?
 —That is so.

6916. That is, that 22 pence are given here to
 the railway companies for the rupee in India?—
 Yes.

6917. Then there is a set off against that, is
 there not, in respect of the capital transferred
 from this country for the construction of the
 railways to India?—Yes.

6918. In that case the Government in India
 gives the railway companies a rupee for every
 1*s.* 10*d.* paid in here?—Quite so.

6919. Does the Government permit any irri-
 gation works to be conducted on private account?
 —In some parts of India there are very extensive
 private irrigation works.

6920. Take a public spirited landlord who
 wished to go beyond the boundary of his own
 estate, and desired, with the consent of his neigh-
 bour, to do so; would he be allowed to do that
 without obtaining the authority, as we should say
 here, of Parliament?—I do not think that such
 a case has ever arisen. I never heard of any
 man proposing to irrigate anybody else's land,
 though I have heard of men proposing to irrigate
 their own.

6921. Has not the great pecuniary advantage
 supposed to be derived from the investment of
 money in this way been a sufficient attraction to
 native landowners?—I do not think that these
 works would be found to be very remunerative if
 you consider the number of years during which
 they do not pay.

6922. But with all the experience that has
 been gained by the Government, would it not
 be possible for a private individual using his own
 intelligence, and such engineering assistance as
 he could obtain, to enter into a transaction of that
 kind with advantage; would the Government
 interfere with him?—I do not suppose they
 would if such a case arose, but I do not think it
 likely to arise.

6923. I suppose the Government would get
 their return in the shape of increased assessment
 from the soil irrigated?—I do not think they
 would look for any increased assessment in that
 case if they had not made the works.

6924. Mr. *Fawcett*.] What is the whole amount
 of the capital account expended on the Ganges
 Canal, do you suppose?—I could furnish you
 with the last capital account, but I believe it is
 about 2,000,000 *l.* sterling.

6925. How many years was it from the time
 that outlay was first incurred before the canal
 began to pay anything?—The canal first began
 to pay a sensible revenue in 1861, after the
 famine.

6926. And when was the canal completed?—
 It was not completed ever then; it was opened
 in 1855, but the irrigation only began in 1858.

6927. I think I understood you to say that this
 Ganges Canal cannot be considered to be remu-
 nerative to the Government at the present time
 if you take into account the number of years
 that it made no return?—It would not be remu-
 nerative if you look merely to the water rent;
 but if you consider the saving in land revenue in
 bad years which it has effected, unquestionably it
 has been highly remunerative.

6928. Yet

Lieut. Col.
G. Chesney,
R.E.
13 June
1871.

6928. Yet simply as a question of receipts it would not be remunerative?—As a question merely of receipts it has not been remunerative, but on more than one occasion the Government has been saved from a very large remission of land revenue by means of the irrigation of the Ganges Canal in bad years.

6929. You have enumerated several irrigation works which have been satisfactory, but there are a great number of others which are in a very unsatisfactory pecuniary condition, are there not, with regard to the return which they make to the Government?—The works of Madras have never in account yielded any direct return, but they are the most remunerative works which exist in India, because they produce very great results with a very small expenditure.

6930. But still that is not shown by figures?—That is not shown by figures, except in this way, that the land revenue of those provinces has increased enormously, and unquestionably that increase has been mainly due to these irrigation works.

6931. £. 8,000 is put down as the only railway receipts; I suppose you are aware that at the present moment the Government is entirely out of pocket by the railway directly, are they not?—That is the only working railway which the Government possess at this moment.

6932. But under this item, supposing that the net receipts in any case exceed the Government guarantee, if the Government divide one half, it would appear under this item, would it not, of railway receipts?—It would.

6933. Then every railway in India, at the present moment, represent a net loss to the Government, does it not?—In 1869-70 it appears to do so, but in some years before, two railways have paid more than the 5 per cent guaranteed.

6934. How do you account for their falling off?—I think it was a temporary falling off, in great measure arising from the financial difficulties in England which had affected trade, and consequently the traffic of the railways very seriously in India.

6935. But in 1868-69 were there any receipts from railways?—I am not able to say from memory whether there was or was not any net receipt.

6936. There is no receipt from them in the estimate of revenue for the present year, is there?—On the expenditure side of the account, is shown the charge for guaranteed interest, and from that is deducted traffic receipts, which also includes any surplus divided by the Government, so that it would not be shown whether it was there or not.

6937. But you do not know from your own knowledge that there is?—My own impression is that three railways are expected to pay more than 5 per cent. on their capital.

6938. Still in the aggregate, considering that there is a very large deficiency at the present moment, we cannot expect that this net sum of money will increase, can we?—Certainly, because not one of these railways is yet fully opened, and the charge of 5 per cent. is on the whole capital, whereas the receipts come from only a portion of the line.

6939. As to the receipt put down here at 8,000 *l.* from the Calcutta and Port Canning Railway, upon what capital does that represent a return?—I think about 400,000 *l.*

6940. And I understand that that 8,000 *l.* is a

gross receipt, and not a net receipt?—A gross receipt.

6941. Then the net receipt will probably be less than nothing?—It has been worked at a loss hitherto; it has not paid its working expenses hitherto.

6942. Can you tell me what the loss is?—The traffic is very small, but it has been a failure throughout.

6943. Is the loss as much as 20,000 *l.* a year?—No; I think it is 5,000 *l.* a year.

6944. So that the Government paid 400,000 *l.* to realise a loss of 5,000 *l.* a year?—No, they would have to pay the guarantee under any circumstances; they bought the line, in hopes that they might reduce the working expenses, and thus make a better thing of it.

6945. Can you explain who recommended them to guarantee 5 per cent. on such a line?—I am not able to say that.

6946. Do you know what year it was done in?—It must have been about the year 1866 or 1867.

6947. Could you, with the same facility as you can provide returns in regard to the irrigation works, provide us with a similar return, in regard to the railways, so as to show the amount expended with the revenue up to the present time, and what it is obtained from?—Very complete returns are in the India Office, and are no doubt available.

6948. Can you accompany your irrigation works return with such a return as that?—I should explain that I have no official connection myself with the India Office as regards these works, but the information is readily available there.

6949. This item of 8,000 *l.* appears as the only railway receipt, because the Government bought the line?—Yes.

6950. Can you explain why they bought the line if they did not think that they could manage the line any cheaper?—They thought they might reduce the loss in working the line, which they have done.

6951. Have they a right to purchase any line?—The contract provides in the case of each railway that the Government shall have the option of purchase at certain fixed intervals.

6952. Do you think from your experience of public wants that it would be a wise thing, with a view of increasing revenue, for the Government to exercise its right, and buy railways?—This was a case where there was a very small revenue with a completely separate staff; by buying the line, and making over the management to another railway company in the immediate neighbourhood, they were able to reduce the staff and the working expenses immediately; the case was exceptional.

6953. You would not draw any conclusion from this case as to a general policy?—Not from that particular case.

6954. Was not an order passed a year since to somewhat limit the right of the Government to purchase?—I believe that in renewing their contracts with some of the companies, they have divested themselves of the power to purchase within a certain time.

6955. But in some cases they have divested themselves of this power to purchase permanently, have they not?—I am not aware of that.

6956. I believe that in this item of Miscellaneous Receipts from Public Works, there is put

Lieut. Col. down the item of Sale of Stores, is there not, sometimes?—Yes.

G. Chesney,
R.E.
—
13 June
1871.

6957. Suppose that a public work has been carried out with public money, and that any stores were bought which were not required, or that the work is suspended, and those stores are sold, do not you think that the proceeds ought to be devoted to capital and not to income?—The work is paid for out of revenue, and therefore I think that the sale of the stores should be credited to revenue.

6958. But not in all cases, is it?—In the case of stores sold from some work which is constructed from a loan fund, then the stores would unquestionably be carried to the credit of the work, and reduce the capital account to that extent.

6959. But I have been informed, on very high authority, that repeated instances have occurred (and I should like to know your opinion on this) of public works carried out by loans in which surplus stores have been sold, and the money has been devoted to income and not to capital?—I am not aware of any such case having occurred.

6960. What department is there, for instance, to check such an abuse as that; whose duty would it be to check it?—The Public Works Code strictly specifies that in the case of all stores sold, the proceeds shall be carried to the credit of the stores account; now, as those stores, in the case of works constructed on loans, are standing at the debit of the capital account, the capital account would therefore be relieved by that sale to that extent.

6961. But who is the particular person who is responsible for that; suppose, for instance, we should discover that such has not been done, upon whom can we fasten the responsibility?—The responsibility, in the first instance, would rest with the Comptroller of Public Works Accounts of the province concerned, who is the officer responsible directly to the Accountant General of the Government of India, who in turn is responsible to the Governor General in Council.

6962. Then, with regard to the province of Bengal, I suppose the person who would be responsible for the act would be the Comptroller General?—The person who would be responsible for the act would be the person who had done it.

6963. Who would be responsible for its discovery?—The Comptroller of Accounts of that province.

6964. That is the person described as the Comptroller of the Government?—No; each province has an officer styled Controller of Public Works Accounts; these officers form the Public Works Account Department.

6965. Each presidency has it?—Each presidency and each province; there are 11 of these controllers altogether in India.

6966. When you say that the money that arises from the sale of stores here has arisen in the case of public works which have been constructed from revenue and not from loans, do you express that opinion simply from a general impression, or after examining into the subject?—Quite so; from knowing that a certain rule exists and that no instances have come to my knowledge in which it has been violated.

6967. Is that a subject which you have ever looked into yourself?—Very particularly; and I have never discovered any instance.

6968. Can we discover from the accounts, for instance, with what public works the proceeds of

these sales were connected?—That return could only be obtained in India; it is readily obtainable there.

6969. In fact, by returns from India, we could see all the details how this item is made up?—The most complete details.

6970. Mr. Crawford.] You are acquainted with a Mr. Danvers' Annual Report to the Secretary of State on Railways, I presume?—Yes.

6971. And that contains full information, does it not, of the whole of the conditions and circumstances under which the railways have been constructed and are working, and everything else connected with them from year to year?—Yes.

6972. And that will afford all the information that you can possibly give, I suppose?—There is a great deal more detailed information also existing at the India Office.

6973. That is a *précis* of the information?—Yes.

6974. That gives a popular view of it?—Yes.

6975. Have you any stock taking of the stores which are held for the purposes of public works?—They are taken stock of every year.

6976. And when a work is completed, if any stores remain, do they go back into the general store, or are they sold?—According to the merits of the case. Generally speaking, or very often, stores obtained for any particular work are utterly useless for any other purpose, because they will not bear the carriage. For instance, take surplus stones or bricks for a bridge in some remote locality, those surplus stones or bricks are of no value to anybody, not being things that will bear carriage they remain on the books as stores till used up.

6977. Suppose you are constructing a work, such as a bridge in which iron enters a great deal into its construction, that will need paint to protect it, and if you have too much paint, what do you do with it?—That paint would not be charged to the works in the first instance, only so much as was used would be charged; the balance would remain as stores. I may add that no stores could be sold without the authority of the Government of the province directly obtained; that forms the auditor's voucher for the transaction.

6978. Mr. Birley.] In regard to the Ganges Canal, what is the area of irrigation; how far does the irrigation extend ordinarily laterally on each bank?—I think a width of about five or six miles on the banks of each channel; but then there are a great many channels and branches.

6979. Taking it altogether?—The whole of the Doab between the Ganges and the Jumna is under the influence of the canal.

6980. To what extent?—It varies from 70 to 80 miles in width.

6981. Do you recollect the length of the canal?—The canal, with its branches, is about 900 miles long.

6982. I want to ask you about the mode of irrigation; I understood you to say that the level of the water was ordinarily below the level of the land, but the water is not raised as in Egypt, is it?—No; but the canal runs with considerable velocity, and has a fall of only about 15 inches in the mile, while the country has a considerably greater fall, so that at the end of every third or fourth mile the water comes to the surface of the country, and is then taken off by a branch

branch channel for irrigation, and the rest goes over a weir to a lower level.

6983. At what speed does it flow?—About two and a half miles an hour.

6984. Is there any complaint of the irregularity of the irrigation, or of the excess of the irrigation; are crops spoiled sometimes from that cause?—The danger is rather that they should take too much water.

6985. But the cultivators have no control; that is done by a Government officer, is it not?—It is done by a very subordinate officer; a man who actually lets the water out is a very subordinate functionary.

6986. Is that a serious abuse?—It is not a serious abuse, but cases of that kind may occur.

6987. And is the action pretty regular; that is to say, can the cultivator tolerably well depend upon his supply of water?—I believe so. I believe on the whole the thing works very satisfactorily.

6988. Mr. Haviland-Burke.] As to the purchase of these canals, have they been bought by what you may call private contract, or have the Government exercised any arbitrary power of purchase?—The whole of those canals were constructed by the Government, in the first instance, except the one in Orissa.

6989. In that case what was the action of the Government that you are aware by what means private undertakings are purchased by the Government in this country; what would be the course in India?—I think that the company found when they had spent all their money and were getting no return for it, they came to the Government and asked the Government to relieve them.

6990. Can you tell me if the case had been otherwise, had it been a profitable undertaking, and had the Government desired to do it for purposes of the State, what course could they have adopted to acquire this canal?—They would have had to offer a very high premium, no doubt, to obtain it.

6991. Would there be any compulsory powers, as there are in this country, for their taking a private undertaking?—I forget what the exact terms of the contract were with that company; I do not think that the Government had the right of purchase.

6992. The information which I want to get at is, what is the course adopted by the Government in India when they desire to obtain possession of a private undertaking. Here, you know, they apply to Parliament, and there is a Committee appointed, and it comes to be heard on both sides; what is the course in India?—There a correspondence takes place between the Government and the representatives of the company. But that is the only case which has occurred, the only case, that is, of an independent joint stock company establishing irrigation works in India, and of which the Government have acquired possession.

6993. If there were another company, and the Government desired to purchase the property of that company, they would have power to do so, I suppose?—In the absence of any specification or Act of Parliament to the contrary, I presume so.

6994. Mr. J. B. Smith.] As to this Ganges Canal, has there not been some difference of opinion as to the proper formation of the canal?—There has been a good deal of controversy about it.

0.39.

6995. And do not some parties contend that that canal, if it were properly constructed, would be capable of producing a larger quantity of water?—I have heard that said.

6996. This Ganges Canal, you say, has only been profitable since what time?—I think it was in the year 1860 that it first began to be so; it was about six years after the first opening.

6997. And do you know how long it was in course of construction?—It was commenced in the year 1845, and, I think, was then suspended during the Sikh War; the actual active operations commenced in about 1848, and it took about six years to construct.

6998. Then there has been a loss of interest upon that capital during all that period?—It was an unusually short period, considering the enormous extent of the work.

6999. But now it yields 7½ per cent. upon the capital invested?—Yes.

7000. Has there been any famine in the district since that canal has been opened?—There have been two cases of very severe drought which would have resulted in a famine, but for the canal.

7001. And, supposing that there had been a famine, then the Government would have lost a considerable sum in rents, would they not?—Unquestionably.

7002. And in revenue in all ways?—Of course, famine cannot occur without affecting trade in every way.

7003. Then, in addition, all those lands which are in the neighbourhood of the canal will sell at a higher rate, will they not, from which the Government derive no benefit?—The Government derive no benefit from the price of land there.

7004. Therefore, in estimating the value of the canal, ought not those things to be taken into account?—Unquestionably; the fact is that the value of the canal it is almost impossible to estimate, any more than you can estimate the value of law and order, or of a good climate, or any of those things.

7005. The canals in Madras have been remarkably profitable, have they not?—Exceedingly.

7006. They have yielded a very large return?—Yes.

7007. And in addition to that, the price of land has been very much raised, and the Government have been able to get much higher prices for their land?—I do not think that there has been much sale of land by Government, but they have raised their assessments.

7008. The rent of land has risen, I mean?—Unquestionably.

7009. Then there have been no famines there?—Not in the irrigated districts; they have completely prevented the possibility of famine.

7010. Has not the revenue generally, in the Rajmundry districts very much increased?—Very much.

7011. And that is all owing to the irrigation?—No, I am not prepared to say that; but it is very largely owing to it.

7012. Have not those revenues very much increased since the irrigation?—Yes; but then the prosperity of the country has very much increased in other parts of India as well, simultaneously.

7013. Then the sums invested in canals and irrigation in Madras have not only been beneficial to the Government in giving a large return upon the

1871.

the outlay, but they have been advantageous also in returning a larger revenue in every respect?—I think it may be inferred that the larger revenue was in great measure due to that, and also to the fact that the people are able to buy more largely, and are richer.

7014. Do you happen to know what the returns are from the Rajahmundry canals?—It is not possible to say accurately, because the original cost of those works cannot be stated.

7015. Are you at all aware whether they do not range from 6 per cent. to 120 per cent. per annum?—I am satisfied that they do not go as high as 120 per cent., what the exact percentage is I am not able to say, because the original accounts when those works were first commenced were not kept in a form which admits of the capital being distinctly separated.

7016. Have you seen any returns made to Parliament of those extraordinary profits?—Yes, and I am satisfied that those returns are not accurate.

7017. They are made by the India Government, are they not?—They were made by the authorities of Madras; and I am able to say, from going into the accounts, that they do not possess the information there which enables them to state in the first place what has been the cost.

7018. Do not they keep accounts well?—They keep very good accounts now; but they did not 15 or 20 years ago.

7019. Sir T. Bazley.] I think you have stated that in some cases the water has been insufficient for irrigation from the Ganges Canal?—That is to say in seasons of drought, you could supply practically an indefinite quantity of water.

7020. And yet there is a supply which would be abundant for all purposes?—The whole of the water of the River Ganges from where the canal commenced is taken up, and the whole of the water goes down the canal so that the canal could not have been bigger.

7021. Then there is really no more water that could be appropriated?—Not in that particular part, but there are other canals which might be made, and are being now made to supplement it.

7022. In some instances it appears that the public works have not been remunerative in a pecuniary point of view?—No, not in the way of giving a dividend upon their capital.

7023. Have there not been in such instances public benefits which have more than compensated for the pecuniary loss?—Unquestionably; in the case of the Ganges Canal, for example, for it is hardly to be doubted that if the canal did not exist, the remissions of the land revenue for 1860-61, and in the great drought which followed a few years afterwards, would alone have amounted to the capital expended.

7024. Then probably you have arrived at the conclusion that the expense incurred by the extension of public works would be a great public benefit?—If carried out with care and economy.

7025. Mr. Lyttelton.] Are these canals, as a rule, navigable?—Those that have been made in Upper India lately, as a rule, are all navigable. It has been found that the navigation on the canals existing and the Ganges, is so small that it has never been thought worth while to apply it to the old canals off the Jumna.

7026. The receipts from navigation tolls are under the "Miscellaneous" head, I suppose?—The

receipts from tolls on the canal are under the head of "Irrigation;" that should have been stated to be for water rents, &c., instead of water rent only.

7027. What amount would that represent?—I am not able to state immediately; the return can easily be obtained.

7028. Something quite small?—Yes.

7029. And you think that there is no prospect of the navigation of the canals being developed?—No; the Ganges Canal runs, so to speak, along the side of the railway.

7030. Generally, I mean?—The experience derived so far, is extremely unfavourable to any such idea.

7031. Hitherto the canals have been constructed solely with a view to irrigation, have they not?—No; the Ganges Canal was constructed, keeping the two things in view, and a very large expenditure was incurred in making the locks, and that returns no interest.

7032. The railway runs alongside of that canal, as I understand you?—Not exactly, but it covers nearly the same ground.

7033. And on the Punjab Canal, what is the case?—On the Punjab Canal the navigation is of the most trifling character; the fact is, that in these canals there is an extreme difficulty in bringing boats back again, unless you use steam power.

7034. People are disinclined to avail themselves of that navigation?—They are.

7035. Mr. J. B. Smith.] Your observations do not apply to the Rajahmundry canals?—No; there the conditions are different.

7036. I think it is stated, that in the Rajahmundry canals, the number of boats have increased from 752 boats the first year to 1,500 boats at the present time?—There has been a considerable increase.

7037. Mr. Lyttelton.] Have you any idea what sort of amount is obtained from navigation?—In the year 1867-68, the gross revenue from navigation was 3,521 l. on the Ganges Canal; but against that, there was to be set the cost of the establishment of boats which belong to the Government, 1,216 l.; so that the profit was only about 2,300 l. on this service.

7038. Were there further deductions to be made for locks?—If you consider the capital cost of those locks, and the establishment kept up to work them, it would probably be found that the navigation was worked at a very considerable loss. I should explain, however, that the establishment at the locks is also available for other purposes.

7039. Mr. Pincett.] You would want the locks for irrigation, would you not?—No, they are all purely additional expense due to the navigation; you might have the weirs without the locks.

7040. Mr. Crawford.] Has the irrigation from the Ganges Canal led to any increase in the exportable produce of the districts, I mean of cotton or goods of that kind which go down to Calcutta and are thence exported?—It is not quite possible to say what has been the increase, but there has unquestionably been an increase.

7041. Is cotton grown there?—Yes.

7042. You could not have got that cotton down so conveniently to Calcutta if you had not had the railway and the canal also?—Yes; the railway always takes as much as it can carry, and the surplus goes by canal or river.

7043. Chairman.] Has the canal led to the growth

growth of what are called irrigated crops to any considerable extent, such as sugarcane, which requires constant irrigation?—To an enormous extent.

7044. And those employ the labour of the country through a great part of the year?—Yes.

7045. Mr. *Fawcett*.] It has not been your duty to advise the Government what public works to carry out, has it?—No; my duty was to control the accounts.

7046. Then who, for instance, is there, or is there anyone according to your knowledge on whom we could fasten the responsibility of advising the Government to guarantee 5 per cent. for a railway which does not pay its working expenses?—I do not know who the authority is who gave that advice.

7047. But is there in the Public Works Department a department of advice?—The adviser in India is the Secretary to the Government of India in the Public Works Department.

7048. Mr. *Crawford*.] Has any guarantee

been given in India?—The guarantee was given in England.

7049. Therefore the responsible person must be found in the India Office here?—I presume so.

7050. Mr. *Fawcett*.] Then had you nothing to do in your department in sending home information to England as to whether a guarantee should be granted to a particular railway, or whether a particular irrigation work should be carried out?—No; that was not part of my duty.

7051. Do you know whether there has been any department whose duty it was to send home those recommendations?—If recommendations go from India, they would go from the office of the Secretary of the Government.

7052. But I understand you that the responsibility of granting these railway guarantees and carrying out other public works is with the India Office in London?—It rests with the Secretary of State for India in Council.

Lieut. Col.

Mr. Birley.	Sir Wilfrid Lawson.
Mr. Bourke.	Mr. Lyttelton.
Mr. Candlish.	Mr. McClure.
Mr. Cave.	Mr. J. B. Smith.
Mr. Cross.	Sir David Wedderburn.
Mr. Charles Dalrymple.	Sir Charles Wingfield.
Mr. Grant Duff.	

THE RIGHT HONOURABLE ACTON SMEE AYRTON, IN THE CHAIR.

Mr. HENRY STEWART REID, called in; and Examined.

Mr. Reid.
—
16 June
1871.

7053. *Chairman.*] WILL you be good enough to state what office you hold in India?—I hold at present the office of Junior Member of the Board of Revenue in the North Western Provinces.

7054. And have you been for some years in the Revenue Department?—I entered it in 1847, I may say; I was in charge of the Educational Department for 12 years.

7055. Have you directed your attention to the Despatch of the Secretary of State of July 1862, with reference to the introduction of a permanent settlement in the North Western Provinces?—Yes.

7056. Can you state whether anything was done on the receipt of that Despatch to carry out the scheme of a permanent settlement?—I do not think that any definite orders were contained in that Despatch. It explained the principles on which Her Majesty's Government were prepared to sanction a permanent settlement, and it was directed that reports should be called for from the local governments; but there was no express order in that Despatch directing that a permanent settlement should be made.

7057. Do you know what was done to carry out those views?—Settlement officers were prepared to take up the question of assessment with reference to a permanent settlement, and it was enjoined on them to be exceedingly careful, and they were told that their responsibilities were increased by this order; but it was merely then spoken of as a prospect.

7058. But were they invited to express any opinion as to the convenience, propriety, or practicability of introducing that permanent settlement?—The opinions of the members of the Board of Revenue and selected officers were called for, I know. I was not then in the Revenue Department.

7059. Have you since had occasion to examine those, so as to be able to tell the Committee what is the general result of them?—A number of the revenue officers were in favour of a permanent settlement, and others opposed it; but the

weight of opinion was in favour of the permanent settlement then.

7060. Were any further instructions communicated on the subject?—No not until the Despatch of the 24th of March 1865, in which definite instructions were laid down, and the Secretary of State expressed the readiness of Her Majesty's Government to sanction an immediate assessment in perpetuity.

7061. Mr. J. B. Smith.] What Secretary of State was that?—Sir Charles Wood.

7062. *Chairman.*] Do you know what was done upon that?—Before anything could be carried out, that is, completed, in India, the Despatch of 1866 (Lord de Grey's) came out, and there a fresh condition was introduced, as it were. The condition under the Despatch of March 1865 was that 80 per cent. of the culturable area should be cultivated: all estates in which 80 per cent. of the culturable area were cultivated were supposed to be fit for permanent settlement.

7063. After the Despatch of Lord de Grey, were any practicable steps taken to carry it out?—That Despatch introduced a fresh condition, namely, that the permanent assessment should not be extended to districts, the assets of which would on the extension of canal irrigation exceed by 20 per cent. the existing assets.

7064. Do you mean by assets, the revenue received?—The whole rent-roll; that is, the whole rental taken by the landowner. If you will allow me, I will read you the words of Lord de Grey's Despatch: "Under paragraph 18 of Sir Charles Wood's Despatch of the 24th of March, No. 11, 1865, no estate of which the actual cultivation amounts to less than 80 per cent. of the culturable or malgozaree area is admissible to a settlement in perpetuity. In like manner, a rule might be laid down that no permanent settlement should be concluded for any estate the assets of which would, when canal irrigation shall have been carried to the full extent at present contemplated, exceed, in the opinion of the officers of the Settlement

tlement and Irrigation Departments, the existing assets in a proportion exceeding 20 per cent."

7065. Then by the term "assets," as there used, what do you understand?—The rental assets.

7066. By "rental assets" do you mean the whole sum that the owner of the property would derive from the land, including the land revenue that he would derive from the land including the land revenue that he would pay, or only his own share?—Including the land revenue. For instance, the rental assets would be, say, 2,000 £; then 1,000 £. would be paid as the Government demand, but it would be included within the rental assets.

7067. Were any steps taken on the receipt of that Despatch to carry out the system of permanent settlement?—Yes; fresh orders were issued by the Local Government, through the Board of Revenue, and settlement officers were again warned that the assessment must now be made with very great care, and that Government must be in no way compromised. In the settlement engagement (which is taken from the landowners) the words, "for 30 years or for ever, as the Government may determine," were inserted in lieu of the words, "in perpetuity." That was to guard Government from being compromised in any way.

7068. By which you understand that it was still left open to the Government to stand upon the 30 years' settlement, or at any future time to make it permanent?—Yes; and besides, no settlement is considered final until it has been sanctioned by Government, and no settlements have been sanctioned by Government except one or two.

7069. Were any further instructions issued by the Secretary of State?—Yes, by Sir Stafford Northcote, in a Despatch of the 23rd of March 1867, in which the second rule, regarding the extension of canal irrigation was modified as follows:—"No permanent settlement shall be concluded for any estate to which canal irrigation is, in the opinion of the Governor General in Council, likely to be extended within the next 20 years, and the existing assets of which would thereby be increased in the proportion of 20 per cent." The term of 20 years was introduced into that order.

7070. Instead of applying it merely to those at present liable to canal irrigation, it was extended to all estates that might be supposed to be subject to irrigation within 20 years?—Yes.

7071. Did you not state, that under these various instructions a permanent settlement had only been actually made in two or three cases?—I believe that it has not been made in any cases at all except under the form of that engagement which allows the Government the option of deciding whether it shall be for ever or for 30 years; that is the engagement which is now taken.

7072. But under the provisions of that engagement the Government have not yet decided that any of those settlements shall be permanent?—No; the current of feeling is now quite the other way in India. It is so, I believe, with the Government of the North West.

7073. When you speak of the current of feeling, do you mean that the deliberate judgment of the officers administering the revenue has changed on the subject?—I think so.

7074. What is their present view, then?—Their present view is that, by the adoption of a permanent settlement you would sacrifice a very large amount of prospective revenue. For instance,

the revised assessments will yield probably an increase of 450,000 £.

7075. That is the revision that is now going on?—The revision that is now going on, assessing, as we are, at 50 per cent. instead of 66 per cent. If the assessment had been sanctioned in perpetuity on existing assets, we should have lost this 450,000 £. a year.

7076. Are we to attribute this increase, notwithstanding that you have lowered the rate of assessment to the improved condition of the agriculture, or to the increase of prices?—In the first place, I think in many districts to increase of cultivation, and also to extension of canal irrigation; and lastly, to rise in rent caused by rise in the prices of agricultural produce.

7077. Then do you not ascribe the increase to any great improvement in the cultivation that was previously existing?—No; except that irrigation is in itself so great an improvement in India; it is both manure and irrigation, you may say.

7078. But you do not attribute it to other modes of improvement; what would be called improved agriculture, for instance?—No, I think not.

7079. So that, in point of fact, whatever increase has arisen does not appear, according to you, to have arisen from any efforts made by persons in possession of the soil, but from circumstances independent of them?—Where there are small holdings, of course the cultivation is very careful; but there has been no improved system of agriculture introduced, that I am aware of.

7080. Was it not careful at the time of the previous settlement, or is the increased charge upon the holder due to his improved care?—I cannot say with reference to former cultivation; but the cultivation now is very careful indeed, in garden land especially.

7081. Then has this change of opinion led to the reconsideration of the question by the Government of the North Western Provinces?—The Government of the North West, in reviewing the revised assessment of Boolundshuhur, one of the districts of the Meerut division, found that although the assessment had been made fairly at the time when it was made, that is to say, that the Government demand represented a moiety of the rental assets of the day, within the five or six years which had elapsed since the settlement, the rentals of certain villages had increased by 30, 40, and even 50 per cent. The Lieutenant Governor reported the case to the Government of India, pointing out that rise in rent must be considered as a most important element in discussing the propriety of permanent settlement.

7082. What was that supposed increase, to which you have now referred, ascertained or conceived to be due to?—It was partly due to the fact that when a revision of settlement is pending, the landowners are rather backward to raise their rent; and as soon as the settlement is concluded and they feel that they are safe, they enhance the rents on the tenants. A certain amount, of course, was due to that. Then again the prices of agricultural produce have risen considerably; there is a much larger demand, and they can export much more largely than they did before.

7083. Amongst the reasons for an increase of assets you have mentioned, you did not say anything of improved communications by railway and otherwise; do you consider that that has contributed to the increased assets of the land?—Decidedly; in districts where formerly there

Mr. Reid.

16 June
1871.

Mr. Reid.

16 June
1871.

was difficulty of communication, grain was selling at mere nominal rates.

7084. Was it the case in the North Western Provinces, that the grain in good seasons was sometimes eaten off the land by the cattle, because it was not worth cutting?—I have never heard that.

7085. But the price of it was almost nominal, you say?—In Jubbulpore, which is now out, but formerly was in the North-West, the price of grain was at one time down to about four maunds a rupee, that is to say 320 lbs. for a rupee.

7086. When it was entirely without communication?—When communications were very difficult.

7087. What is now considered, or what would you consider the ordinary price of grain at Jubbulpore?—I could only hazard a guess; about 50 or 60 lbs. in place of 320 lbs.; there is that difference I should think.

7088. But Jubbulpore was an extreme case, I suppose?—I mention it as a very extreme case, and a great number of years ago.

7089. Can you give the Committee now generally what is conceived by the revenue officers of the North Western Provinces to be the just view of the advantages or disadvantages of the permanent settlement?—I think that the general view, is that the advantages are purely theoretical. I think in the Despatch the advantages were enumerated as being the increased contentment and loyalty of the people, and the encouragement afforded to laying out capital. Under the rules that were laid down in the Despatch of 1865, a permanent settlement would be made at higher rates than a temporary settlement; for instance, if the settlement was made for 30 years, it would be made at a moiety of the rental assets, that is to say, if the rental of a village was 1,000 £, the Government demand would be 500 £; but if it was made in perpetuity, it would be 600 £ in place of 500 £. No landowner in India would care to pay for 30 years 600 rupees, or 600 £ a year in place of 500 £. And then again, he does not look forward 30 years; he thinks that at the end of 30 years the change may be for his advantage; he would rather not be tied down for ever.

7090. You think that he would like to have the matter reopened in case there should be any change adverse to him?—Rather, in case there should be any change favourable to him.

7091. Change of circumstances adverse to him; and therefore change of revenue demand more favourable to him?—Yes.

7092. Is it your opinion that in the treatment of his property as to what is called the improvement by expenditure of money, he would not be influenced by any consideration of whether the settlement was for 30 years or in perpetuity?—No, I do not think he would. He fully believes that under the temporary settlement at the end of 30 years he will be settled with again.

7093. You think that the less rent would be an equal inducement to him during the 30 years to spend money as paying the higher rent would be?—The higher rent of course furnishes more inducement to a man to improve his land, but independently of that it would hold out no further inducement with reference to the idea of a perpetual tenure.

7094. You rather adopt the view that high rents make good farmers?—I think they do up to a certain point, till the rent is crushing; I

found that the case in Assam, the revenue-rates were normal, and there was no farming at all.

7095. The people were so indolent you mean?—Yes; by cultivating a few acres they could satisfy the Government demand.

7096. And has the effect of increasing the demand been to increase their industry?—They were talking of laying on a much higher assessment; I was there merely for a few weeks.

7097. Have you anything further to say as regards your opinion with reference to the advantages of the 30 years' settlement?—Of course there is that great advantage that you revise the accounts, as it were, at the end of the 30 years, and Government participate in the additional profits arising from increased cultivation or increased irrigation, or a rise in the price of agricultural produce and of rents.

7098. Are you able to state to the Committee whether in the principle of a revision the officers are entitled to take into account improvements that result from the increase of capital in farming, and from increased skill, or whether they are bound only to regard the prices and the natural condition of soil, and the facilities for irrigation?—The assessment is made generally upon the existing rental assets of the village; the assets may have been increased at the expense and by the labour of the landowner. In that case the settlement officer will very likely make some allowance; for instance, if the landowner had such a large amount of capital in making masonry wells, and had done so just before the settlement was commenced, the settlement officer would assess that land at a sum very little above unirrigated rates; he would allow him the benefit of his expenditure of capital.

7099. When you say, if he had lately made that expenditure, do you mean within the period of the former settlement, or within a very recent period?—If he did it so long ago that he had recouped the original cost by additional profits, then I do not think it would be taken into account.

7100. But you think that if it was an improvement from capital not resulting from natural causes, if he had not been recouped he could not be assessed on it as against him?—He would not be assessed at full irrigated rates, and if the improvements were very recent, the assessment would be very little above unirrigated rates.

7101. But supposing that the person, by highly manuring his farm, or by improved processes of agriculture, had increased the gross produce, would the additional rental derived from that be the subject of assessment as part of the assets, or would that be thrown out of the account?—If the person who improved the land were the tenant, the Government would take from the landlord half the rent, but if he were a landlord they would not assess at rates much higher than the rates for land of a similar quality in the adjoining villages.

7102. You mean that if they were dealing with the holding purely as a question of revenue, they would assess the land according to its quality as compared with the qualities of adjacent lands?—Yes.

7103. They would not take into account the fact that he got more by farming his land better than his neighbour?—No; not if he had not himself received the profit in the shape of additional rent. If the manuring was done by the tenant, and the tenant was paying, say 10 rupees an acre, when other land of the same kind was only paying

paying eight, Government would take the half of 10, and not the half of eight.

7104. Then, according to your view, if the landlord improved the land for his tenant, instead of the tenant doing it, the assessment would not be increased in that case, whereas if the tenant did it, it would be increased?—The assessment would be increased if the tenant were at the trouble and expense, and paid a higher rent.

7105. Can you explain upon what principles of right that is done; how do you reconcile it with the system of taxation of the land; that if the landlord should improve the land and employ a tenant to cultivate it, the assessment should be one way, and that if the tenant should do it, the assessment should be another way?—The assessment is made upon actual rental, and in the case where the tenant has improved the land, he may be paying a higher rent. When the landlord has himself improved the land, and himself cultivates it, the rent would be calculated at the average of the rent rates of land of similar quality in the vicinity; so that he would in that case, you may say, escape additional assessment. If the landlord had improved the land and let it to a tenant at a higher rent, the Government demand would be calculated as the higher rent; I missed the words "for his tenants," in the preceding question.

7106. Supposing two pieces of land in the same immediate neighbourhood of precisely the same natural quality, and in the same natural conditions, and that in the one case the land yielded a higher rent to the owner than in the other, would you take half the higher rent in the one case as you would in the other?—May I explain it in detail? In Oude the assessments are made almost entirely on what are called conventional soils. There are three zones of cultivation: one immediately surrounding the village, an intermediate zone, and an outlying zone. Originally the lands in the intermediate zone, and the zone immediately surrounding the village, were of the same quality; but the lands immediately adjoining the village site have been largely manured and irrigated, and the soil has been improved; the rent rates of that zone are perhaps double those of the intermediate zone, and we should take double as the Government demand from the land.

7107. In my question I asked you about land under the same natural conditions, and those two zones are not under the same natural conditions. I wanted to ask this: Supposing that two holdings existed in the same zone; the one by reason of its being very highly cultivated, yielding a large return, and the other cultivated in a very low way, and yielding a smaller rent, would you take half the rent of the highly cultivated plot, and half the rent of the inferior cultivated plot, as the measure of assessment?—The assessment of the Government demand would be based on the rental; if the rental were double in one case the Government demand would be double.

7108. Have you heard, either directly or through the officers of Government, that there is any feeling expressed by the native holders in favour of a permanent settlement, or is their feeling generally in favour of the 30 years' settlement?—I think that they are rather indifferent to it in the abstract, and they certainly would prefer a more lenient settlement for a term of years than a higher assessment in perpetuity.

7109. Do you speak of that as the generally

expressed opinion, or is that your idea of the thing?—I never discussed that opinion with our settlement officers; but I believe that that is their opinion.

7110. I meant to ask whether you had opportunity of discussing it with the native holders of intelligence so as to know what their view would be?—It has been regarded as being so entirely in abeyance for the present, that it is not a subject that I have taken up very much in my intercourse with the natives.

7111. Sir C. Wingfield.] With reference to the question just now put to you about manures, do you believe that, in practice, a settlement officer ever considers the question of the application of manures to the soil, and made any allowance on that particular ground that the soil had been manured?—Only in this way, that the manured land bears always a higher rent rate and a higher revenue rate.

7112. I perfectly understand that he has looked at the quality of the ground, as that quality had been produced by manuring, but he never made a man any allowance or deduction because he had recently spent money in manure?—No.

7113. And in fact no artificial manures are used in India; the manure that a man puts on his field is just the droppings of the cattle that he collects?—Yes; and sometimes they do collect manure.

7114. But there is no artificial manure used, such as guano?—No.

7115. And you recollect, no doubt, that there was a principle of assessment laid down by the late Mr. Thomason that it could never be reduced to a mere matter of arithmetical calculation?—Yes.

7116. And is not that the principle that guides settlement officers now very much?—Certainly.

7117. And although you look at the rental which the tenant pays to the landlord for the land, still you do not implicitly follow that; you also form your own idea of what the proper rental of the land is?—I do not think that we often go above 50 per cent., but we often go below it.

7118. Every settlement officer has rent rates on different soils, to guide him?—Yes.

7119. And he applies his rent rates to the rental as derived from the landlord's returns, and he sometimes is led to the conclusion that the rental as shown in the landlord's returns may not be the proper rental to apply to the land?—In that case he would correct the landlord's rent roll by what are called the Pergunnah rates, that is, the average rent rates ruling in the neighbourhood.

7120. In how many districts is the settlement of the North West Provinces completed?—The settlements may be said to be entirely concluded in seven districts; although they have not received the sanction of Government, the real assessment is concluded; they are very nearly concluded in three, and they are in progress in 15.

7121. Sir William Muir, the Lieutenant Governor of the North West Provinces, was, a few years ago, a great advocate for the permanent settlement, was he not?—Yes, he was.

7122. And I think he wrote a Minute on the subject in favour of it?—Yes.

7123. Can you tell me whether he retains that opinion now?—I believe not, as he has referred the question of the propriety of a permanent settlement to the Government of India, with reference to the facts elicited by the inquiry into the adequacy of the Boolundshuhur assessment.

Mr. Reid.

16 June
1871.

7124. Those facts have caused him to modify his opinion, and to the best of your belief, at the present time he is opposed to a permanent settlement?—I think he is.

7125. And from what you have told us, I fancy we may infer that the Government, as yet, is in no way pledged to sanction the settlement in perpetuity in any district?—Not that I am aware of; they are protected by the form of settlement engagement which was issued in 1867.

7126. You seem to think that the landholders do not attach much value to a permanent settlement; does that remark refer rather to the small landholders, or would you include the large landholders in it also?—I should include them all.

7127. But have you not in conversation with the large landholders, heard any wish for a permanent settlement expressed?—No; I have not discussed the subject much with them.

7128. When you were in Oude, did the talookdars never express their wish for a permanent settlement to you?—No, not even there; I cannot recall to mind any expression of the kind.

7129. You never sought opinion on the subject in Oude?—It was not mooted at all then in Oude.

7130. You said that this increase of rent which has been so noticeable in one district of the North West Provinces was not owing to improved agriculture?—No.

7131. By that I fancy you mean not owing to any improved system of agriculture; but may it not have been owing to more valuable crops being raised than formerly used to be raised?—Where canal irrigation extends, there is, of course, a greater breadth, for instance, of sugar-cane cultivation.

7132. And has not the sugar-cane cultivation increased greatly in the last 20 years?—Very largely indeed.

7133. So that it would be a more correct way to put your answer thus: that the style and system of farming has not altered, but that better and more valuable crops are raised?—That might be included in the reference I made to irrigation.

7134. Rents in the North West Provinces are generally paid in money, are they not; I mean they are paid in money more than in kind?—Yes.

7135. And is it not the case that corn rents are decreasing, and money rents are superseding corn rents, even in those districts where corn rents still prevail?—Yes, it is the interest of the tenant now to have the corn rent commuted into a money rent.

7136. In fact, was there not an Act passed in the North West Provinces some few years ago, respecting the commutation of corn rents into money rents?—No, but the Board of Revenue have submitted a draft Rent Bill to the Local Government.

7137. That was part of the measure, was it not?—Yes.

7138. A good industrious tenant would prefer a money rent, would he not?—Yes.

7139. And wherever you find the rents in kind, it is generally the case that the cultivation is of an inferior kind, is it not?—Yes; in the famine that was particularly remarkable; the land that paid money rent was irrigated when the land that paid a grain rent was left dry.

7140. Should you say that the practice of settlement officers was to take no account of the expenditure of the proprietors in wells that have

been constructed many years ago, wells of old date?—Just so.

7141. Only in the case where a man had made a well within three or four years, would an allowance be made on that account?—Yes.

7142. Are you aware that one marked effect of the permanent settlement in Bengal, is that the parties with whom it was made have created permanent under-tenures at a fixed rent, thereby divesting themselves of all prospective benefit from increased rental?—Yes; and the law has done the same in the North West Provinces in the Benares Division.

7143. Which is under a permanent settlement?—Yes, the law I allude to, is Act 10 of 1859.

7144. Those results that have been observed in Bengal are equally observed in the Benares Province, are they not?—They are observed, but not to the same extent; there is not the same minute subdivision of tenure there that there is in Bengal.

7145. Therefore, one effect is, that the benefit of a permanent settlement may very soon be lost to the parties with whom the permanent settlement is made, and other parties not in the contemplation of the Government may step in and reap the great advantages of the permanent settlement?—Yes, in the form of under-tenures absorbing the profits; but in temporarily settled estates the remedy is in the hand of the landowner, to some extent; he can turn a man out before he acquires a right of occupancy.

7146. I am not speaking of tenant rights of occupancy acquired by prescriptive occupation, but of those under-tenures created, in which the landowner has alienated his interests. The parties with whom the permanent settlement was made, are therefore not by any means always those who reap the benefits, but other parties not in the mind of the Government at the time of the settlement may be real gainers by it?—I think such cases would be comparatively rare.

7147. You have heard that they are very frequent in Bengal?—The subdivision there is very minute.

7148. And the first holders of the under-tenures have permanently leased their tenures to other parties, who again have leased them, sometimes there are two or three links in the chain of middlemen. You have heard that perhaps?—Yes, I know that they have minute subdivisions.

7149. *Chairman.*] Under the law, if a person who pays revenue to Government wishes to make a grant at a fixed rate in perpetuity to a third party, that grant would still be subject to the right of the Government to revise the settlement under which the revenue payer held at the time?—Quite so; the Government rate would not be affected in any way whatever.

7150. *Mr. Birley.*] Are the North West Provinces thoroughly surveyed?—There are three kinds of survey; there is the survey of the whole of India of the Topographical Society; then there is the Revenue Survey; that also is a scientific survey; and then there is a survey made by native surveyors for assessment purposes, under the supervision of the settlement officers.

7151. You do not remember perhaps upon what scale?—The common scale is 2 native chains, of 55 yards to 1 inch.

7152. That is on a very large scale, so that the different

different holdings are clearly and distinctly laid down, I suppose?—Every single field.

7163. That is, I suppose, every distinct patch of cultivation, because the fields, I fancy, are sometimes very large?—The rice patches are often not larger than the space inclosed by these tables, and they are down.

7154. Then, as regards the assessment, that is made in the first instance from a return from the zemindars or other holders, I suppose?—The zemindar gives in his rent roll.

7155. And that is checked by the surveyor, or by some officer appointed by Government?—In the first instance, the village is very carefully measured, and opposite the entry for each field the quality of the soil and irrigation, or non-irrigation is put down, and the rent rates are ascertained from inquiry in the village, and the neighbouring villages of the rent rates paid for different kinds of soil and for land in certain positions; those near the village paying more than the out-lying lands. Then the landholder is called upon to give in his rent roll. His rent roll is corrected by a reference to these rates, which have been ascertained by the settlement officer to exist either in that village or in neighbouring villages, looking to the quality of the land, and the circumstances of the village too, of course.

7156. And, as far as you know, the assessments are acquiesced in, as being just and equitable, are they?—In some cases, where there has been a rise in the Government demand, although the Government demand may be very moderate, the landowner does not look so much at the moderation of the demand, as make a comparison between the old land revenue and the present.

7157. I am not asking whether there are individual or even numerous instances of complaint, but the justice of the action of the Government in the matter is admitted in the main, and there is no general complaint of oppression?—Not at all.

7158. The mode of assessment is not a matter of complaint in the province?—No.

7159. Is there much uncultivated land that ought to be cultivated in the North West Provinces?—In some districts hardly any; in others, like Goruckpore and Bustee, there is still a considerable amount of uncultivated area.

7160. Is that coming under cultivation?—Yes, rapidly; in fact the revised settlement for Goruckpore and Bustee, has risen from 200,000 l. to 280,000 l.

7161. Has any large increase of traffic by railway or river, or by the road, occurred of late years?—By river there is an increased traffic. For instance, in the famine year very large supplies were sent down from districts which did not suffer.

7162. Supplies of grain you mean, wheat and rice?—Yes, chiefly.

7163. You said that the sugar-cane cultivation had largely increased of late years; is that a great article of export, or is it chiefly consumed in the large cities of the North West Provinces?—It is an article I may say sent to neighbouring marts chiefly, and from thence it is exported elsewhere.

7164. You spoke of this as the permanent settlement, and I think it is generally called the permanent settlement of the North West Provinces; but as a matter of fact, it is usually a 30 years' settlement, is it not?—We have no real permanent settlement yet, except in the Benares

Division; and these despatches to which I have referred, contemplate the introduction of a permanent settlement into the districts at present temporarily settled.

7165. But that has not been carried out?—It has not been carried out.

7166. Nor is it likely, I apprehend now, to be carried out from the feeling of the officers in the province?—I think that there is a very strong feeling against the propriety of a permanent settlement.

7167. You told us that when a settlement had been made, it was not binding till it had received final sanction from Government; is it the fact that settlements are made and acted upon for a series of years that are not held by the courts of law as being conclusive against the Government, though assumed to be so by the proprietors or occupiers?—The assessments are made, not for a whole district of course at once, but for certain portions of a district called pergunnahs; three or four, perhaps, may be assessed at the same time, and the revised assessment declared is provisionally sanctioned by the Board of Revenue. When the whole district has come under assessment, report is made to Government and final sanction is accorded. I do not think that the courts of law would hold that the engagement was binding before that final sanction.

7168. As I understand you now, there does not seem to be any objection to that; it is simply a provisional arrangement for a number of years?—It is a provisional sanction till the final sanction of the Government is accorded.

7169. Is it usually limited to five or six years?—It ought not to be beyond six or seven years at the outside.

7170. I presume that it very rarely is?—Very rarely. There are causes that sometimes retard the final completion of the settlement.

7171. Mr. Beach.] Irrigation works have been more exclusively conducted in the North West Provinces than in any other part of India, have they not?—I do not know with regard to Madras; certainly more so than in the Punjab or Bengal.

7172. Upwards of two and-a-half millions has been laid out in irrigation works there, I think?—I cannot remember the exact expenditure: I know that there has been a very large expenditure.

7173. In the famine year that proved of the greatest advantage to the country, did it not?—Yes.

7174. And there was a great disposition on the part of the inhabitants to use every exertion to avail themselves of the advantages afforded by the Government, was there not?—Yes.

7175. Do you think that there is an inclination to believe that those works had been more extensively conducted in provinces where the permanent settlement does not exist?—We have no canals in the North West Provinces in permanently settled districts.

7176. And do you think that people might be prejudiced against a permanent settlement, from the belief that the Government then would not be inclined to undertake such extensive works?—Government would look to a return from the water rate; but owing to the position of the permanently settled districts (they all lie down close to Benares) there are no facilities there for the construction of canals.

7177. But in other parts of India, irrigation works might be of great use I suppose, as in the North

Mr. Reid.

16 June
1871.

Mr. Reid.
16 June
1871.

North West Provinces?—I do not think that the question of a permanent or temporary settlement would affect the action of Government in the matter, or that the people would take that fact into consideration.

7178. Mr. Fawcett.] What proportion of the land in the North West Provinces is under permanent settlement?—The area of the land under permanent settlement is 10,973 square miles.

7179. And all that has been placed under permanent settlement in consequence of the Despatch of 1862, which was sent out by Sir Charles Wood, has it?—No, this has been permanently settled for a long time; it is an old permanent settlement, and has nothing to do with the present revision.

7180. Then are we to understand that as yet no result whatever has been produced in consequence of this Despatch of Sir Charles Wood's?—I believe that no result has been produced.

7181. Then the Despatch has not operated at all; it has simply become a dead letter?—The Despatch has been modified twice since, first by Lord de Grey, and then by Sir Stafford Northcote, and the final sanction rests I imagine, with Her Majesty's Government at home. Everything is being prepared and made ready for a permanent settlement.

7182. Therefore the thing is in this position, that if for instance a Secretary of State should happen to take office who is in favour of the permanent settlement, there is nothing whatever to prevent him from bringing a considerable proportion of the land in the North-West at once under a permanent settlement, is there?—The districts, of which the assessments that have been made under the orders of Government, with a view to either a temporary or permanent settlement, could of course, at once be brought, under the orders of the Secretary of State, under a perpetual settlement.

7183. And you think that the Secretary of State would have power to do that, and might do it, although it may be contrary to the policy of the Governor General and contrary to the opinion of those who are engaged in the assessment?—I do not know the extent of the powers of the Secretary of State in that matter.

7184. You would rather not express an opinion on that point?—It is rather a matter of fact perhaps than of opinion; I do not know what the powers of the Secretary of State are.

7185. That is your impression, that there is a great amount of land now ready for permanent settlement which may at once be brought under permanent settlement if the Secretary of State for India should think it desirable to do so?—I believe so; under the settlement engagement in which the words are recorded that the settlement "shall be for 30 years or for ever, as the Government may determine."

7186. But then do you think, as this Despatch was written in 1862, and the despatches of Sir Stafford Northcote and Lord de Grey were five years afterwards, that any land has been placed under a permanent settlement in that interval of five years?—The Despatch of 1862 did not direct that a permanent settlement should be made; it merely expressed the readiness of Her Majesty's Government to sanction a permanent settlement under certain conditions, and reports were called for.

7187. But as the policy of a permanent settle-

ment was recognised in 1862, and that policy was not altered as I understand for five years, do you think that the people who brought themselves under the conditions of 1862 think that they have at any rate an equitable claim to have a permanent settlement made with them?—I think that very few have engaged for a permanent settlement, the form of engagement is "for 30 years, or for ever, as the Government may determine;" and in the circular of the Board of Revenue issuing that form, it was directed that this form should be substituted for the previous form, so that probably if any engagements had been taken in perpetuity they were cancelled, and the revised form substituted in their place. I am speaking of what I imagine has been done.

7188. I understood, perfectly, that no one after the revised order was issued, which stated that the Government reserved to itself the right either to have a 30 years' settlement, or a permanent settlement, could have any moral or equitable claim to a permanent settlement; but the thing is different, is it not, with regard to anything done previous to the time when that order was issued?—I think that very little was done; I am not aware how much, and I think that the people themselves do not care for this permanent settlement.

7189. Do you think that there is land fit for permanent settlement in the North-West?—A very large number of estates already fulfil the two conditions.

7190. I suppose you agree with those who lay down a most broad and fundamental distinction between revenue obtained from the land, and revenue obtained from any other source with regard to the incidence of it upon the people, and the feelings of the people?—Yes.

7191. You would define in fact land revenue as rent?—As a moiety, the Government proportion, of the rent.

7191.* And you define rent as the appropriation of a natural monopoly which, if it was not appropriated by the Government, who can administer it for the good of the people, would be appropriated by a class who might devote it entirely to their own advantage?—The native Government appropriated the whole of it.

7192. But that indicates, does it not, the difference between revenue derived from the land, and revenue derived from any other source?—Yes; I do not look upon it as a tax.

7193. Therefore, if for instance the Government, having now the proprietary right in the land, permanently settle any land, what they virtually do is this: they give away a portion of national property which belongs to the whole nation, and should be used for the whole nation, to a class, do they not?—Yes; they give away the property of the State, and, I suppose, you may say of the people.

7194. For instance, the result of the permanent settlement in Bengal has been this, that we have sacrificed about three-fourths of the revenue that we might otherwise obtain from the land, and in consequence of that sacrifice, which has not benefited the general body of the cultivators, we have been obliged to impose taxation which appears to be onerous and vexatious?—Yes; and of course the same effect would follow if we alienated this 450,000 £. increase which we get on the revised assessment of which I spoke.

7195. Is there not in your mind a very strong reason, a stronger reason than ever existed before, against

against the permanent settlement, from what has taken place during the last few years in India, with regard to the depreciation of money or the general rise in prices?—So far, of course, as the rise in prices affects rents it has aggravated the evil.

7196. For instance, if prices rise, we will say are doubled, then if the land revenue is permanently fixed, the Government, independently of any change in the agricultural circumstances of the country virtually loses half its property, owing to the permanent settlement, does it not?—It loses its right to claim the additional profits at the end of the term of the settlement.

7197. In fact if prices are doubled the Government could, merely from that circumstance, double its land revenue, if it were not permanently settled, without placing the proprietors or the persons under them in one jot more unfavourable a condition?—The land revenue would not be doubled because the rent does not rise in anything like the same proportion. The Government do not look to the price of agricultural produce, but to the rent, and the rent we find does not increase in anything like the same ratio as the value of agricultural produce.

7198. But if the rent increased 50 per cent. in consequence of a rise of prices of 100 per cent., the Government then could very considerably raise their land revenue without taking really more from the cultivator?—Yes; certainly.

7199. And you have remarked that that depreciation in the value of money has gone on in India during the last few years, has it not; I define depreciation of money by a rise in general prices; that is only a different way of expressing the same thing; that has gone on to a marked extent during the last few years, has it not?—Yes; you may say since the mutiny.

7200. I suppose we are to draw the conclusion from your evidence that you are very decidedly opposed to the extension of the permanent settlement?—Yes, I am very strongly opposed to it.

7201. And as a practical measure for preventing its possible extension, would you not recommend that something definite should be done to reverse the policy contained in the Despatch of Sir Charles Wood, of 1862?—Of course, from what I have stated, my opinion must be that it would be better that the orders regarding the introduction of a permanent settlement were cancelled.

7202. So as absolutely to prevent the permanent settlement being extended in any way?—Yes; I think that the permanent settlement is an evil.

7203. And that cancellation would have to be done, in your opinion, by the Secretary of State for India in Council issuing an order to cancel; would it not?—The orders for the introduction of the permanent settlement of the North West emanated from the Secretary of State, and I suppose that they could only be cancelled by him.

7204. From your knowledge of the opinions of land revenue officers, I think you stated that at the present time there is almost an unanimous opinion amongst those gentlemen who administer the land revenue in opposition to a permanent settlement?—I think so.

7205. And probably one reason why people who were in favour of the permanent settlement, some years ago, have now become so very strongly opposed to it, is due to the fact that I previously alluded to, that the depreciation in the value of money has brought home to them the fact that

the Government must inevitably lose by a permanent settlement?—Yes, certainly.

7206. That you think has strengthened the opposition to it?—Yes; as shown by the reference made by the Lieutenant Governor to the Government of India; the reference was based entirely, I believe, on the rise of rental consequent on the rise of prices and extended cultivation.

7207. Do you know from your knowledge, or can you direct your attention to any opinions that have been expressed in favour of the permanent settlement lately by any high authority, anyone now resident in India?—No, I do not know any eminent advocate for the permanent settlement at the present day in India.

7208. In fact you know a great number of officials and persons connected with the administration of the land revenue strongly opposed to the permanent settlement, and you cannot quote anyone of mark who is in favour of the principle now in India?—I cannot recall any at present; I think, at any rate, they must be very few.

7209. Therefore we may draw the conclusion that an order issued by the Secretary of State for India to cancel the despatch in favour of the permanent settlement would meet with almost unanimous approval from the officials in India?—I think it would be generally approved as they generally disapprove of permanent settlements.

7210. And would not be unwelcome even to the people who would be immediately affected by it?—No; I do not think that they would care much for it either way; I know that they would rather not pay an enhanced Government demand for a term of years, which they would have to pay if there were a permanent settlement.

7211. We are also distinctly to understand, I think, that there is altogether a different feeling in the people of India in paying land revenue from that which they have in paying any other kind of taxation?—Yes; I think that any other kind of taxation is much more distasteful to them; and it is comparatively novel.

7212. And, therefore, it may very seriously affect the loyalty of the Indian people towards our rule, and their contentment with it, if, there being a sacrifice, for instance, of four millions of land revenue, it is necessary, in consequence of that sacrifice, either to increase the tax or duty on some article of general consumption, such as salt, or to levy some tax which is looked upon as vexatious, like the income tax?—I think it would be most dangerous.

7213. Mr. J. B. Smith.] Then, do you think that the feeling in India is now that the claims of the Government upon the land are for the benefit of the whole people of India, and that in proportion as Government expenses may be increased by the depreciation of money, in the like proportion the rents of their land may increase, so that the one may compensate for the other?—Yes, after the expiry of the term of settlement.

7214. Do you think that that is the existing feeling of the people of India?—They recognise the entire right of Government to claim a large portion of the rental; they do not dispute the right; it never enters into their minds to dispute it.

7215. Because that has always been the custom, has it not?—Yes; as I said, the native governments used to take almost the whole rent.

7216. And there never was such a thing as a permanent settlement heard of till the time of

Mr. Reid.

16 June
1871.

Mr. Reid.
16 June
1871.

Lord Cornwallis?—No; the arrangements were made generally from year to year; certainly they were in Oude under the late native government.

7217. But the settlements formerly used to be made from year to year, and in some cases the rental was calculated upon the crop, was it not, under our Government 20 years ago?—I do not remember that, but the settlement in the North-West was made on rental.

7218. What is the principle upon which this assessment is made. Supposing that you begin to assess a district, and in the course of two or three years, before it is completed, there is a very great increase in the price of produce, and also of rents, is your assessment in that portion which remains unassessed increased in proportion to the advance in the price of produce and rents?—It would be open, I think, to the settlement officer to revise the settlement of the parts of the district which had been assessed in a case like that.

7219. Then in a case like that he would revise the assessment on the whole?—He might revise the assessment, I think, on the whole. A case occurred the other day in which it was supposed that the assessment had been made at too low rates, and if that had been proved to be the case the assessment would have been modified.

7220. And they do that on the ground that the assessments are not binding upon the Government until they have been sanctioned by the Government?—No; but at the same time the Government would be very backward in revising the assessment; they would rather suffer a loss, I think, unless it were a very large one.

7221. I think you stated that railways and irrigation works increase very much the value of the land?—Yes.

7222. Now supposing that a railway was projected through a certain district, and that this railway was not made in the district at the time of the assessment, but that there was a probability of its being made within a year or so, how would that affect the assessment?—The assessment officer is expressly told not to look at prospective profits; he would assess upon the existing rental.

7223. Even if the railway was to come about in the next year he would be bound to assess upon the existing rental?—I consider that he would be bound to assess on the existing rental; I may add that even in the case of the permanent settlement the orders were that prospective profits were not to be taken into account.

7224. Mr. Birley.] You excepted irrigation, did you not?—If there was a probability of irrigation there would be no permanent settlement allowed.

7225. Mr. J. B. Smith.] But then in cases of irrigation you charge a water rent too?—The Government would look to its profits from a water rate. That is what complicates considerably the question of the permanent settlement.

7226. Chairman.] I understand you that the actual value of the land quite independent of the water rate, would also be considerably enhanced if irrigation was brought to it?—Yes.

7227. Therefore there would be a double increase, one the increase of assets, resulting from the improved positions of the land by reason of the water, and the other the rate received for the water used on it?—Yes; the two would be taken up separately.

7228. But both would arise in almost every case, would they not?—Where canal irrigation was extended, if it was extended within the

period for which the Government had entered into a contract, as it were, with the landowner, the Government could not profit by the extension.

7229. The landholder would profit by the improvement of his land, and the Government would only receive the water rent in that case?—Yes.

7230. But, as a general rule, there would be a considerable enhancement in the value of the land, quite apart from the water rent, by reason of the land coming in under the supply of water, which formerly had been dry land?—Yes; and that matter was the subject of a correspondence between the Government Irrigation Department and the Board of Revenue.

7231. Mr. J. B. Smith.] Is the rent of the land the only element in the estimate of the value of it; is there nothing in the quality; and do they not examine the quality of the land?—Yes; but, as a rule, the quality governs the rent rate. All those elements are taken into consideration in making out the rent roll.

7232. And not the rents solely?—We look to the rents, but not to the rents alone. For instance, if we think that the rent is inadequate, and higher rent rates are paid for land of the same quality in the neighbourhood, we should not look merely to the absolute rents paid for those particular fields.

7233. Mr. Lyttelton.] Does the settlement officer place implicit confidence in the statement of rental as returned by the landlord or the village head-man?—No; he receives them with very great caution.

7234. False returns are often made?—Some settlement officers place very little faith on them, and others attach more credit to them, but no settlement officer could think of accepting them without careful scrutiny and examination, and comparing them with the rent rates ascertained by inquiry to exist in other parts of the district.

7235. I think you said, in answer to Sir Charles Wingfield, that the settlement officer never assessed anyone over 60 per cent.?—He has no right to assess over 50 per cent. The Government now take a moiety, instead of two-thirds as they did before, and in very few cases is more than 50 per cent. taken, and in some cases where there are large cultivating communities, and there is a very minute subdivision of land, they are obliged to lower the rate below 50 per cent. In some of the districts there are very large cultivating communities of this kind, and the average area which each proprietor holds is not above four acres, and on that he has got to maintain himself and his family.

7236. Chairman.] After his remuneration as actual cultivator, there is less surplus obtainable as rent?—Yes; and in those cases we make a reduction.

7237. Mr. Lyttelton.] At the end of a term of settlement is it the case that the landlord allows the cultivation to deteriorate, with a view to imposing upon the officer?—Yes; certainly that is one of the devices which they adopt; but our settlement officers are picked men, and men having now considerable settlement experience. I do not think that any device of that kind would answer with them.

7238. Is it found that collusive lowering of rents ever takes place between landlord and tenant?—Yes; but then that would be corrected by reference to the rent rates paid for similar land in the neighbourhood. More favourable rents are given, for instance, to a Brahmin cultivator.

vator. The settlement officer would tell the landlord that he had no right to be generous at the Government expense, and he would assess the land as though it were held by an ordinary cultivator.

7239. What appeal is there from the settlement officer?—In certain matters the appeal lies to the revenue authorities, and in others to the civil court.

7240. Are there many appeals?—There are a great number of appeals in regard to the rents fixed by the settlement officer, but there are not many complaints of over assessment.

7241. Is it your opinion on the whole that the assessment is as high as it can be?—It is as high as it can be, and higher in fact in certain cases, because reductions have to be made under certain circumstances; but where a large extent of country is held by a single owner, of course the 50 per cent. is not a severe assessment. I do not think that it would be politic to raise the per centage.

7242. Mr. *Grant Duff*.] Have you ever heard the Government blamed for making an improvident bargain with the cultivators, that is to say, for charging too little?—Well, there is one school, I know, which asserts that the settlements are far too light, notably in the Central Provinces.

7243. Who are the chief representatives of that school?—I believe the chief exponent of those views is the “Indian Economist;” that is the paper in which those views are largely ventilated.

7244. And at what point would they put the assessment in the North Western Provinces?—That I cannot tell you; I look upon their strictures as so much froth, and do not pay much attention to them.

7245. And you yourself are satisfied that we

have hit about the right point; that the assessment is neither too light nor too heavy in the North Western Provinces; you think that the Government, on the whole, acts fairly by itself and by the cultivator?—Yes; I think they act fairly, certainly by the people, and also fairly by themselves, although Mr. Colvin, by whom the per centage of the Government demand was reduced from 66 to 50, was blamed for having done so. The question was brought forward with reference to the settlement of Boolundshahr by a Member of the Government of India the other day.

7246. But now the prevalent opinion is that we have hit, in the North Western Provinces pretty much the right point?—I think so.

7247. Mr. *J. B. Smith*.] What comparison will our assessments bear with those of the native governments?—The native governments were supposed to take pretty nearly the whole rental. In Oude, for instance, under the native government, the whole rental was taken, and then an allowance was made, called a subsistence allowance. In the permanent settlement we were supposed to take nine-tenths or ten-elevenths; we are now taking one-half.

7248. *Chairman*.] Do you think that the native governments were very exact in ascertaining what the real income of the property was?—No; of course the whole calculation was a very rough one indeed; and no minute inquiry was made, such as we make now.

7249. Sir *Charles Wingfield*.] And was not there also this consideration on the other side, that if a landholder was very powerful and had a good fort, he would not pay it if they asked too much?—Yes; I was speaking with reference to the thing theoretically.

Mr. Reid.
16 June
1871.

The Rev. JOHN WILSON, D.D., called in; and Examined.

7250. *Chairman*.] You have resided for many years in India?—Yes, it is upwards of 42 years since I became connected with India, and I have only been once at home before this time.

7251. I believe you have, during a considerable part of that period, mixed very much with the native communities where you have been?—Yes, I have had occasion to mix very much indeed with them, both in the North Western Provinces, forming the whole of the Bombay Presidency, and the native states connected with Bombay and Scinde, and in fact in all the north-west of India.

7252. Have you also had good opportunities of observing their habits and manners?—Yes; and I have studied them as developed in the Hindu literature, while for the last 10 years I have been engaged in writing a work on the Hindu castes, embracing a description of the different tribes of the country.

7253. When you were in India was your attention directed to the cultivation or the consumption of opium?—Yes my attention was directed to it. I have visited Central India where the opium works go on, and have been acquainted, too, with the fields that are here and there devoted to opium in the native states.

7254. That is on the western side of India?—Yes; I have passed through the districts on the eastern side merely as a casual visitor. I am acquainted with the system pursued in both places.

7255. Can you give the Committee your views
0.59.

as to the cultivation of opium?—Yes, I have formed definite views on the subject.

7256. Would you be kind enough to express them to the Committee?—When I passed through Rajputana, particularly looking at the opium fields, and more especially, when I came into Central India, I became very much afraid of the fate of the cereals. You are aware, that in Rajputana there is great uncertainty about the rains; they are very partial during some seasons, and sometimes they are very limited indeed. And while in the west of Rajputana, owing to the works of Colonel Hall and Colonel Dixon, there is provision made for irrigation, which leads to the cultivation of a good many fields, yet in regard to the supply of cereals the provinces of Rajputana are altogether uncertain. Now, it so happens, that the provinces of Malwa, which are contiguous to it, have all their best fields occupied with opium; I became therefore very much afraid of the consequences of any famine in the matter of obtaining the supplies that might be needful; and my fears were very much realised in connection with the late famine that took place in Rajputana.

7257. Is it your view that the better land, with the advantage of irrigation, being dedicated to the production of opium, does not become available for the production of food?—I am not alluding to those districts where that irrigation of Colonel Hall and Colonel Dixon, to which I have referred, is carried on; but I refer to the opium

Rev. J.
Wilson, D.D.

Rev. J.
Wilson, D.D.
—

1871.

opium fields, and the land appropriated to them, more particularly to Central India and to Malwa. I have found this to be the case from examination of Government documents, that in the year 1856-7, there was an increase of the acreage in Central India devoted to opium. That year the amount devoted to opium was 275,784 acres, and in the next year the amount of land there devoted to opium was 289,062 acres. That increase was caused by the Government finding it necessary to bring a greater area under opium, in consequence of the fall of price they had in the Bengal districts. In 1865-66 the acreage devoted to opium in Bengal was 700,000 acres, and next year, 1866-67, it was 750,000 acres. I am not prepared to express an opinion about these districts of Patna and Ghazipore, devoted to opium, and the effect they might have upon the proper production of cereals; but I have formed a very definite opinion as to the necessity of looking to the opium area in Central India; and it is a fact that there was lately an inadequate supply of food for Rajputana, so much so, that according to the Government accounts, if I have read them correctly, 1,200,000 people died of famine and the diseases induced by it. Now, in ordinary circumstances, the Province of Malwa might have supplied the people of Rajputana with cereals.

7258. Do you think that the land dedicated to opium, if employed in producing food, would have been sufficient to have saved those who died of famine?—To a very great extent. It is by far the most valuable land in the province.

7259. Would it be capable of growing rice?—No, not rice, to any extent.

7259.* But all kinds of grain food except rice?—Yes, certainly.

7260. Do you think that any special influence is produced upon the population by being engaged in this cultivation, or are they in other respects as well off as people engaged in the ordinary cultivation of the soil?—I have noticed since I went to India that there is a great increase in the use of opium amongst certain classes of the natives. It is used very largely by Mahometans, and I think I understand how they have fallen into its use comparatively to a greater extent than the other natives of India. According to the Mahometan religion, the use of wine and spirits is forbidden, and hence Mahometans betake themselves to opium. And I am the more confirmed in this opinion by the fact that the word for opium is an Arabic word, and that it was in the districts of Turkey that opium cultivation was first developed. Then, again, the Rajput princes and nobles, and their dependants and associates now also use opium to a very considerable extent, and to a most injurious extent. I have known some of the nobles and chiefs kill themselves by eating opium. A short time ago I observed one of them lifted into a railway carriage in a silver chair, quite unable to move himself into it, or understand anything. When I saw him as a young man, I found him a very intelligent person; while in these circumstances I found him quite stupid, with his faculties nearly extinguished. Then, again, there are some of the labouring classes addicted to using opium, particularly to quiet their children when they are away engaged in work. On the whole, I have no hesitation in saying that the increased use of opium has been considerable during the two score years and more that I have been connected with India, and that it is on the increase.

7261. Do you find that the cultivation of the opium leads to any special consumption of it on the part of those engaged in the cultivation?—No; I did not find them specially addicted to it. There are patches of opium in the native States generally contiguous to the villages where the natives raise opium; and frequently the higher classes of the natives, the landholders, or nobles, have fallen into a copious use of it.

7262. Do you find that the cultivators engaged in producing the opium are better off in their circumstances, and more prosperous, than those engaged in other branches of cultivation?—I do not think that is the case. I have noticed very great progress in the well-being of the Mahratta and Gujerat cultivators under the British Government. Their clothing is better than when I first noticed them; their food is better; their utensils are more valuable; and they appear to me altogether to have made very great advances. But in the native States you are aware that the opium fields are chiefly under Holkar and some of the chiefs near Ratlam; and although I do not place the prosperity of those districts on a level with Gujerat, I do not know that they are in more favourable circumstances from cultivating opium; the middlemen are in better circumstances than others, but not the cultivators. I am not able to suggest the reason of the case, though I know the advantages which our own subjects have, compared with those which the native subjects have.

7263. Did you see anything of the condition of the cultivators in the Bengal Provinces where the opium is cultivated?—Yes; the peasantry there are decidedly worse clothed, and appear not so active as those in the Mahratta districts.

7264. But, compared with the other peasantry in the same provinces, engaged in other branches of agriculture, did you notice any difference in them?—No; I do not think there is any particular difference between them; I do not know much about them. In fact, I do not wish to be considered as a particular observer of those districts. I cannot speak of them with the same confidence as I can of those districts with which I am most familiar.

7265. Where have you chiefly observed the consumption of opium amongst the people of India?—I have observed it in the city of Bombay, which is now the largest, next to London, in the British Empire, in the Province of Gujerat, particularly the Kattywar district, and in Kutch and Scinde.

7266. Is the consumption there of the opium in a solid condition?—No; in those districts they use it in a liquid form called Kosumba. The manipulation of it is peculiar; they add something to the lump opium, and then pound it in a mortar; and they generally use it by pouring it upon the palm of the hand, and asking you to take it out of their hand. I ought to have mentioned one class of people addicted to the use of opium which I consider rather dangerous, and that is the devotees. I have frequently been asked by them to take opium in this liquid form, when I have been travelling. It might have been mentioned in reference to the country I have passed through, that I have gone to the jungles east of Mount Abu and moved among the Hill tribes and other tribes, between Gujerat and Khandesh. I have also been in the jungles of the Northern Concan and elsewhere among the wild tribes. I did not observe in them any considerable use of opium, but they

they seem addicted very much to the use of spirits.

7267. Mr. J. B. Smith.] Do a great many of them smoke?—They smoke, and there is no divorcing them from their smoking. They said they could not live without tobacco. "You have told us many very good things," they would say, "but this objecting to tobacco is one bad thing, and we cannot give up our tobacco."

7268. Do they smoke opium mixed with tobacco?—No; they cannot afford to purchase it.

7269. Do they in the other districts use it in that way?—No; they only use it in the lump or liquid state.

7270. Chairman.] Do you think that the consumption of opium is of a character that may be called excessive by individuals?—Many of them use it to an excessive degree.

7271. Has it the effect of disqualifying them for the ordinary duties of life?—Yes; and I am sure it has injured the administration of the native chiefs, and has often stupefied them.

7272. Passing from the highest class of natives to the trading class, do they consume it much in your opinion?—I do not think I could lay the use of opium to the charge of the trading class to any considerable extent.

7273. Do the working people, the agricultural population, consume it to an extent injurious to their health?—Some of them do; some of the artisans, too, who travel about use it to a very considerable extent.

7274. Have you directed your attention at all to the regulations of the Government respecting the sale and consumption of opium?—Yes; in regard to that matter, I should wish very much the Bombay system applied throughout India as long as the opium business continues. I have frequently found the natives bringing up our dealing in opium as adverse to the character of the Government; and I believe that it presents the British Government in a bad position to the natives, while if it were left to be merely dealt with by an excise as is the case with regard to the opium produced in Central India, the Government would not have that responsibility before the people, which in their conversations they always use to the injury of the Government.

7275. Have you considered at all how far that arrangement would be convenient for the collection of the revenue in the British territory?—Yes, I have thought of this; I have no doubt that the Government could divest itself, to some extent, of its responsibilities by giving licenses to persons to cultivate opium; but it would be needful, in order to prevent the spread of the evil, that Government should limit the area of opium cultivation.

7276. Have you considered at all the laws relating to the retail of opium in any parts of India?—I am aware that licenses are required for the sale of opium. I may mention in connection with this that there are other substances of an intoxicating kind which are used, particularly bhang, which are exceedingly injurious; and that, generally, the persons who deal in the one article deal in the other.

7277. Have you considered at all how far the present system of regulating the retail of these articles is desirable?—I think that both in regard to them, and in regard to spirits, the opinion of the newly formed municipal bodies, and the councils of the villages should be taken.

7278. In what way, and to what extent?—I

0.59.

think that before licenses are granted by Government in particular districts and villages, the opinion of the municipal bodies which have been formed, and the principal people of the villages should be taken. I think that giving indiscriminate licenses, and in some instances establishing monopolies, is a great temptation to the increase of the use of opium and of drunkenness. I have noticed some of the tribes going down to absolute destruction in connection with that matter.

7279. You would restrain the power exercised by the magistrate by the opinion of the inhabitants or the municipal body?—Yes. In regard to all the public officials of Government, I have seen only benevolence exhibited by them in connection with the jungle tribes. There is a universal desire to elevate them, and much has been done in their favour, but this one thing of their drunkenness still exists. I have here a report of one of the tribes which I happened to describe in a paper given many years ago to the Asiatic Society, the tribe of the Waralis, in the Concan. Mr. Boswell, C.S., says, "The attention of the Government has been, on several occasions, called to the condition of the Warlee tribe as being addicted to violent crimes and specially degraded, and withal so little used to intercourse with European officials as to run away when such approach their villages. In consequence of this, the Government have called for a report on the moral and social state of these people and the best measures to improve them. * * * At the time of the wedding, the caste people assemble and feast for four or five days at the expense of the parents of the parties married. During this time, men and women and children drink freely; all get drunk together and leap and shout and fall on the ground, and no shame attaches to them; most of the Warlees are enslaved for life by the expense thus incurred." I have lately got an establishment for the education of some of these people, and this is a photograph of one of them that was induced, with great difficulty, to come to Bombay to be photographed (*handing the photograph to the Committee*).

7280. Have you any suggestions to make with reference to the laws regulating the trade in spirits and opium?—With regard to spirits, I think that there should be an increase of the excise duty; I think it may be trebled even without any injury to the revenue or to the people, nay, very much to the benefit of the people; and I think that great care should be taken in giving licenses. I may mention, also, that there are some of the native chiefs who are permitting distillation in their districts, who, according to the customs in use in these districts have no title to do that; and I think that this ought to be looked after.

7281. Have you seen any instances of a general prevalence of excessive drinking in any parts of India?—Yes. I have had my attention directed very particularly to that, and from the proof sheets of my book on caste now before me, I could show exactly how the use of spirits has prevailed in India from very early times. In the Vedic hymns there are numerous references to the Soma juice, and the intoxicating liquor produced from it, which was most exhilarating, as it said in the Vedas, to men and to the Gods, and was very copiously used; and I have no doubt, although of late years there has been an increase in the intemperance of India, that it is a very old disease of the country. And I can show what the legislation of the Hindus, in reference

Rev. J.
Wilson, D.D.

16 June
1871.

Rev. J.
Wilson, D.D.
16 June
1871.

to the matter was, from their sacred books. In the Yajur Veda and the Black Yajur Veda, there are references to different parties that were tied to stakes in connection with the ceremonial of human sacrifice called Purusha Medha, known to our Orientalists, and among the persons tied up to these stakes, I find the distiller mentioned. Then again, in the epic of the Ramayana, when all the classes of the inhabitants go out to meet Ram coming back to his capital to take possession of the throne, he is met by a number of professional people of different kinds, and amongst these there is Shaundika the distiller. Then, on coming down to the times of Buddhism, I find that they laid down very strong injunctions against the use of spirits. In an analysis which I have made of the Buddhist morality, from their books, I have said, "intoxication is held (by the Buddhists) to be the greatest of all sins, as it leads to the perpetration of all other kinds of sins. The use of liquids and solids leading to it is forbidden, though this precept must be little regarded by the Buddhist-Chinese opium eaters. The anti-intoxicating laws of Buddhism, may be a reason of the resistance of the Chinese Government to the opium trade." And with regard to that matter, I may add that two days ago a translation of a pamphlet by a Chinese came into my hands, and I found a sentence in it, which I will read. This pamphlet is a most horrid pamphlet intended to excite the Chinese people against the Christian nations, and it is so bad that I am sure no gentleman here ever perused anything equal to it.

7282. Sir W. Lawson.] Is that the work we have heard of as the work of "A man most distressed in heart"?—Yes; the title of it is "A Death-blow to Corrupt Doctrines;" but in reference to opium this passage occurs in it: "Opium is produced in the West, its smell is fragrant and its taste very delicious, and when first taken it will cure disease. There are none of the foreigners who eat it themselves, but they beguile the Chinese to pay enormous prices for it and eat it. After a time it emaciates the body and wastes the springs of life, until the whole man becomes a wreck, so that many die from the effects." That is in connection with Buddhism. With regard to the Brahmins the Hindu legislation of the law books is very precise. The drinkers of spirits and sellers of these liquids are condemned, but the reason of the intensity of the legislation as directed against the Brahmins is mentioned in a passage that I shall refer to. According to Menu, the drinking of spirits is the first sin, after the murder of a Brahmin, that is specified; and afterwards, in another part of the same legislator's work, it is said the reason of the severity of the estimate formed of the vice is this: "A drunk Brahmin may fall into something impure, or may, when intoxicated, make a Vedic utterance, or perform some unlawful act." That is the reason stated for peculiar caution in regard to him. In regard to the other castes, even some of the Shudras, there was permission given to them to drink, even though this was always reckoned a vice. In "Lord Valentia's Travels" it is mentioned by him that at Poonah, under a Brahmin Raj, about 1804, he found drunk, people lying at the corner of every street; and no doubt there was a great deal of drunkenness in the country before our influence began to be felt in it.

7283. Chairman.] Do you think that the amount of drunkenness has increased?—Undoubtedly it has increased.

7284. Do you think that the consumption of drink has also increased, without going to the extent of producing drunkenness?—I should not say that all who use spirituous liquors become drunkards, even among the natives.

7284*. My question is whether the consumption generally, or the use of spirituous liquors, and these articles, bhang and opium, has become more generally diffused without going to the extent of excessive indulgence?—Yes, and it is so to an extent that is sufficient to arouse the consideration of Government.

7285. Do you find that it has extended in particular castes or classes of the community, or is it in all classes?—The dealers in spirits are principally Parsees in Bombay and the neighbourhood, and along the coast of the northern Concan. I do not think that they are peculiarly addicted to intemperance as a community.

7286. But as to the consumers, to what class does your remark chiefly apply?—In regard to them, I think that the lower orders are those whose drunkenness appears most conspicuous. As a matter of fact, I have seen in the houses of native chiefs, the evil of the practice of the copious use of spirits and opium.

7287. But amongst the lower classes, do you think it runs in particular tribes or classes?—I think that the labourers, not so much those that do skilled labour, but the men that are employed in jobbing labour, are very much addicted to it.

7288. Do you propose that the consumption of all these commodities should be suppressed altogether, or that it should be modified in the way you have suggested, by calling in the opinions of the principal inhabitants of the community?—I do not think that it would be practicable to put it down altogether, and it would be a vain attempt for the Government to make. The question is, how to restrict the license system; there are certainly, as I said before, too many licenses given.

7289. Mr. Cave.] You stated, did you not, that to raise the duty would be the first thing that you would do?—Yes; that would be one of the measures.

7290. We have heard that the duty could not be raised to any extent without smuggling taking place; what is your opinion on that point?—There is smuggling at present, and there might be, no doubt, a temptation to have more smuggling if the duties were raised; but I think that by proper precautions the evil of smuggling could be avoided.

7291. But it would be very expensive, would it not, to oblige us to have a cordon of very considerable extent?—I think the authorities of the custom houses in the coast towns would be able to look after that matter without any very considerable expense to Government; I think the expense would be remedied by the greater revenue the Government would receive; there would be an increase of revenue in the first instance.

7292. That would only take place with regard to the opium that was shipped, would it not?—I do not think there is any smuggling in regard to that opium which is shipped. The patches of opium in the native villages produce a certain amount of opium which is carried by travellers from place to place in the interior, and I do not think there is any other kind of smuggling.

7293. I thought you said that it would be at the ports that the supervision would take place?—On the coast; but I am alluding to the common officials of Government connected with the revenue

revenue and the Custom House. I think that with very little increase of the number of persons so employed the evil could be remedied.

7294. Is there not smuggling before the opium comes down to the coast?—No, I do not think there is any in connection with the Malwa opium. When there was a line of native territory leading down to Damaun belonging to the Portuguese, there was smuggling of the exported opium, but that has been entirely prevented, since we got the whole seaboard under our power.

7295. But is it not taken across the frontier of the native states inland?—Not for export; in fact the Chinese merchants now are acquainted with the Government opium, and I do not think they give encouragement to smuggling in India.

7296. But the consumption of opium in the country is what I mean. The duty is an excise duty upon the opium that is grown in the Malwa district?—I think my remark about the excise is more applicable to spirits than to opium; I do not think that we can raise much the excise duty on opium.

7297. Then you are only alluding to the customs duty upon opium as exported?—I was alluding more particularly to the spirits in reference to the increase of excise.

7298. Do you think that the duty upon opium can be raised to any extent?—No, I think that the tendency is for the price to fall; and I have no doubt, since the Chinese themselves are producing it, it will fall.

7299. Then you do not think that the duty could be raised upon opium?—I am not inclined to think it could.

7300. You propose to apply to the municipalities for their opinion before opium or spirits are brought into a district?—Before spirits are brought; and I think it expedient too, that they should be asked about the sale of opium and bhang.

7301. In such a case, do you imagine that the opinion of many municipalities would be against the sale of opium?—I am sure it would. I have heard the people complain of their being troubled with drunken persons in consequence of the sale of these spirits, and I am sure it would be a good deal acceptable to a great many of the villages in India if the use of spirits were entirely interdicted; but I say nothing about that.

7302. How would that public opinion be ascertained?—In all the Mahratta country the village system is something of a municipal character, and there are representatives of the villages and the cultivators; there are organised officials, and it is quite easy for the collector to ascertain their views. Government has on some occasions made references to them about different matters.

7303. They would need somebody to express their opinion?—Yes; they would be assembled at the Chandari, the place where they hold their meetings.

7304. They would wish to be kept out of temptation, is that your meaning? or that they would merely wish to prevent themselves from being troubled by drunken people, as you said just now?—Both to be kept out of temptation, and to prevent the trouble accruing from drunken people going about.

7305. With regard to the Malwa territory, you said, did you not, that you thought there was a danger of famine in consequence of so much land being cultivated with opium?—Yes; famine is to be expected principally in Rajputana, although I have often heard that even Malwa in Central

India requires grain to be brought into it as a compensation for the occupation of the fields by opium.

7306. Is the land under opium cultivation more profitable than that under grain cultivation?—It is more profitable to Holkar now, because by some arrangement he participates in the advantages of opium cultivation.

7307. But does the holder of the land, the cultivator (I do not mean the labourer, but the person who gets the produce of the land), get more from the land under opium?—Yes, I think that there would be a greater produce of money received by him, although it would not affect the population generally, or the workmen.

7308. But if a man had power over his own land, he would, for the purpose of securing a larger profit, be likely to carry on the opium cultivation, as I gather from you?—I think that almost all the land capable of growing opium in Central India is occupied by it at present.

7309. If it was more profitable to grow corn, they would grow corn, I suppose?—Yes.

7310. But it being more profitable to grow opium they grow opium?—Yes.

7311. Then the produce of land under opium being greater than the produce of land under corn, would not that enable the people to buy more corn from other places in case of scarcity?—Yes, we should think so; but the conveyance of it is very expensive, and till the railways penetrate these districts it must continue so. I believe it was found quite impracticable to bring up a sufficiency of grain to Rajputana during the late famine; and in the same way when the famine broke out in Orissa it was found very difficult to convey grain enough thither.

7312. Looking at it merely from a mercantile point of view it is better that land should grow that which produces the greatest amount of money, is it not?—No; not until such time as there is an equilibrium maintained in reference to food. I even told the Secretary of the Cotton Association that they ought to import grain in lieu of cotton. One of the merchants of Bombay during a rise in prices brought some oats to India. The people were everywhere suffering from the want of grain, owing to the demand for the cotton even, and we must look to the food of the country, as it is without the equilibrium of trade. It is not so sensitive in regard to supplies as this country is.

7313. Then you would say that the money which ought to be spent in corn is not spent in corn, and therefore it is better that the corn should be grown on the spot though less profitable?—Yes, in the meantime.

7314. Sir C. Wingfield.] Why do you think that a very great proportion of the area of the soil of Malwa is occupied by opium?—Just from the impression made on me in passing through the districts; I observed that the best fields were used for opium; I have mentioned that the whole acreage in 1866-67 in Malwa devoted to opium was 289,062 acres.

7315. How do you know they are acres, were they not beegahs?—I go upon a Government document; the "Statement of the Progress of India for 1866-7;" I will read the paragraph on which I found my statement: "In consequence of the authority given for the extension of opium cultivation the total quantity of land taken in Bombay (on the printed margin, 289,062 acres) exceeded that in 1865-66 by 13,278 acres; the out-turn of the season was estimated at 48,500 chests of provision opium, and 3,523 chests of Abkari opium;

Rev. J.
Wilson, D.D.

1871.

opium; and in Behar and Benares the area had increased from 700,000 to 750,000 acres."

7316. But that 289,000 acres is no great proportion, is it, of the soil of the countries in which opium is grown?—It is no great proportion of the geographical area, but it is a very great portion of the land that is fit for cultivation.

7317. There is a large portion of the area unculturable, you mean?—Yes.

7318. Do you think that if power were given to the municipalities they would limit the number of shops and places for producing spirits, or that they would restrict the consumption of spirits very much?—Yes; and I think they would prevent their coming into places where the native tribes, the lower tribes, are.

7319. By the municipalities do you mean every village corporate body, or do you apply it merely to the larger towns?—I would apply it to the towns and larger villages as a practical measure.

7320. But you have no municipalities in the sense in which we understand the term in many of the towns?—In the Mahratta country there is a regular organised village municipality, which has been from very early times.

7321. You applied the term only to the towns?—The reference I would principally make would be to the intelligent classes of those towns; but even when a small village objected to the establishment of a shop for opium, I think that ought to be regarded.

7322. In the villages or the towns of India generally it may be said that the upper class do not drink, and that the lower class do. By your plan you would give to one class of society power to decide that the other class should not consume spirits?—The upper classes, with the exception I have mentioned, are not so much addicted to the use of liquor as the others, but the settlement would not rest entirely with them, because the agriculturists are particularly represented in the village system, the Mahratta system.

7323. I do not know exactly what it may be there, but certainly in the upper parts of India, it is the case that all people who consume these things are the low castes, the class who are known to do the servile offices, and they have no voice or influence whatever in the village or town municipalities; they would be the consumers, and those who have to make laws for them would be the non-consumers?—Yes. I would not consult those addicted to drunkenness much on this subject; there are but few of them connected with the chandaris that we have got.

7324. Then, in fact, it comes to this, that the class who do not drink, and who look upon drinking as a sin, will have it in their power to interdict the other class from drinking who are addicted to it?—To a certain extent that would be the result, but I have no doubt that individuals of the classes that suffer from drunkenness would strike up with them.

7325. But have you not heard it said of these low caste people who have to be out at night watching the fields, doing laborious duties, particularly in the damp rainy weather, that drink is necessary for them?—I have not heard very much said on the necessity of drink.

7326. Sir W. Lawson.] I think you know a great number of the native languages?—Yes; and I have studied Sanscrit, which is the basis of the northern languages, and some of the other Oriental languages.

7327. You converse with the natives themselves on some of these topics in their own lan-

guages?—Yes, I do fluently converse with them in the native languages.

7328. Is the consumption of opium amongst the natives any greater in those districts where it is grown than in the districts where it is not grown?—I am not prepared to express a very decided opinion on that subject.

7329. Do you consider that the consumption of opium in India by the inhabitants is a great evil, the same as drinking here, or is it not the same evil?—Yes, the use of opium is a great evil; it is extremely injurious.

7330. It is consumed to such an extent in India that it may be called one of the national evils?—Yes, certainly, in the districts of India with which I am acquainted, it may be so called.

7331. What districts do you refer to particularly?—The Mahratta country, the Gujerat country, Rajputana, Kathawar, or the Peninsula of Gujerat, Scinde, and part of the Canarese country too.

7332. What opinion do you think the natives generally hold regarding the Government connection with the opium traffic?—I have frequently heard the natives referring to it as indicating that the Government had not proper regard to the well-being of the different oriental nations; that it was accessory to the injury of China and to the injury of India by what it did in favour of opium. I am in the way of hearing them bring forward objections to Government; but generally, I must say, that in those districts with which I am acquainted, with the exception of the opium matter, they are very much inclined to speak well of the Government and the way in which it conducts its administration.

7333. But do you imagine that if the whole traffic were carried on under excise regulations, instead of the Government being the monopolist and selling the drug itself, there would be greater temptation to the people to consume opium in India?—No, I think not. I do not think that if the Bengal Government adopted the Bombay system it would lead to a greater temptation than formerly.

7334. We had it from a very competent witness that there were three objections to throwing open the trade simply with excise restrictions. One objection was, that there would be more smuggling; the next objection was, that there would probably be more opium consumed by Indian people themselves; and the third objection was the loss of the manufacturers' profit. Do you agree with that view of the question?—No, certainly not, because I think it would be expedient for Government still to attend to the area of cultivation as it at present does in Malwa; and I do not see how there would be any increase of smuggling; under the present system there is no smuggling connected with the export of opium, that I am aware of.

7335. Do you think that there would be no increase of consumption among the people?—No; I do not see that there should, because wherever there are patches of opium fields belonging to natives that would meet the local supplies, they might be kept under surveillance. I do not see that there would be any temptation to increase smuggling.

7336. The witness whom I allude to took pretty much the same view of those two objections, but said, that the real objection was the loss of the manufacturers' profit to the Government; I suppose that would be the case?—I do

not

not see how it would be the case, because the Government could regulate the duty, so as to get the same revenue from it that it gets at present, according to the demand.

7337. Then you would prefer on every ground the Bombay system to be extended over the whole of India?—Undoubtedly; it would free us from a great deal of responsibility and a great deal of trouble: I think it would be a great relief to the Government; I think it is out of its province when it devotes its energies to any single one of the products of the country.

7338. And you would have a system of selling opium under licenses?—Yes.

7339. But then, if you consider that the consumption of this opium is injurious to the people, you surely would not have the consumption of it licensed?—I look upon the licensing system associated with taxation as something like a *quasi* limitation of it. I do not think that it confers a moral right to sell the opium; it is rather *pro tanto* a restraint upon the sale. I do not think that the duty on spirits increases the responsibility of our own country for the production of spirits.

7340. If you consider it injurious to the public, would you not consider it well for it to be prohibited altogether?—I should wish all temptations removed, if that end could be obtained; but we must look to the position of matters. I do not think, for instance, that Mahommed gained anything by the absolute restriction that he put on wine and spirits; and I think that the use of opium is to a great extent the consequence of that restriction imposed by law.

7341. Do you think that the use of opium or of wine and spirits, or whatever the intoxicating spirit they use is, does the most public harm in India?—Some of the higher natives do not use our wine and spirits at all.

7342. Which does the most public injury to India, the opium or the spirits?—In Bombay, where our wine and spirits are sold to the sailors, who come there, there is very great injury throughout the town; but they are only sold to a very limited extent in villages and towns exterior to Bombay. In these the native arak is used.

7343. But I wanted to know your general opinion whether you thought that the opium trade or the trade in strong drink promoted most injury to the people at large in India?—I think I should not be able, without very much consideration, to balance the account between the two.

7344. Have you turned your attention to the salt tax?—Yes; I have turned my attention to the salt tax also.

7345. Have you any strong opinion on that tax?—In regard to the natives—I have never met a native in the Bombay Presidency who complained of the salt tax. At the same time, I have noticed that they use comparatively a smaller portion of salt than we do. I have attributed that partly to their using spices. For example, some of the fish that they preserve are steeped for a considerable time in tamarind juice, and by the use of spices they compensate for the want of salt to a considerable extent. But I have never heard of any complaint against the tax on salt. It is very much a capitation tax, and some of the more intelligent natives, when arguing with me against the income tax, have proposed an increase of the salt tax, while I have contended against it. I have met with friends who said that they found the natives complaining of the want of salt; but I was not

satisfied that in these cases they understood exactly the idiom of the natives, because they often talk of salt, meaning by it, their own food. For instance, the Sepoys talk of getting their salt from Government, meaning their living.

7346. We have heard a good deal in England at different times as to the grievance of the salt tax; how do you suppose that that outcry has arisen?—The tax, as far as I know, does not exceed 1 *d.* a pound at any rate; and, as a matter of fact, I have not heard the natives complain of it. I cannot recollect an instance of a native complaining of the salt tax. They give the price for the article, and they do not inquire much about it.

7347. Mr. Birley.] Is there any strong religious prejudice in those districts of India, with which you are well acquainted against the use of opium?—I think it was an article unknown to the ancient Hindus, and there is a strong feeling against it in certain classes of them; but the Mahommedans and the Rajputs, and the other classes that I mentioned, use it without being much put out of the way by any public sentiment.

7348. I thought you referred to the sacred books of the Hindus?—I read some passages from them, but they were about the use of spirits.

7349. It does not include opium?—No. The word itself is a foreign word, and the poppy has been introduced into India.

7350. Do you know when the poppy or the use of opium was introduced into any part of India?—I should say, speaking generally, within a century. Perhaps the Mahommedan Princes of Delhi knew of it, and used it; no doubt the doctors knew of it.

7351. But it never came into common use till within the last 100 years?—No, not to any great extent.

7352. Mr. C. Dalrymple.] Have you known persons of influence and importance in India, who have volunteered expressions of disapproval in regard to the relations of the Government with the opium trade?—In arguing with the natives about our religion and habits and customs, I have found them bring it up. I do not say that those who have expressed themselves so, belong to the higher classes; indeed, their own addictedness to the use of opium, would prevent their saying much against it.

7353. Mr. Candlish.] What is your position in the Bombay University?—When I left India I was Vice-Chancellor of the University at Bombay.

7354. You say, do you not, that there is smuggling both in opium and in spirits?—I have mentioned that I am not aware of any smuggling in connection with the export of opium since we got possession of the sea board. I have no doubt, however that balls of opium of a rude kind are taken by the natives in their packages from the native states where they have small fields devoted to it; but that is merely for local use.

7355. Then the smuggling is mainly in spirits?—Yes, in spirits. I have frequently, in the jungles, come upon stills unknown to the authorities, where I have found them distilling spirits.

7356. I rather gathered from what you said a while ago, that you are inclined to an increase of the duty on spirits?—Yes, I am certain that it would be advantageous to the Government and to the people to double or treble the duty upon spirits. A person can get drunk for an anna, at present.

7357. And do you think that the increase of price, which you suggest, would lessen the consumption?

Rev. J.
Wilson, M.P.
—
16 June
1871.

Rev. J. Wilson, D.D. sumption?—It would lessen the consumption, but still the produce for the revenue would be larger.

16 June 1871. 7358. You mean that you would recommend an increase of duty for the sake of the increase of revenue rather than because of the lessening of drunkenness?—I think it would accomplish both objects. I wish the duty increased to diminish the consumption, and also I should not object to its increasing the revenue, which I believe it would do.

7359. Do I rightly infer, too, that you would be prepared to increase the salt-tax?—I am not prepared to increase it; I only mention the fact that I have not heard complaints against it. I believe that the natives would submit to an increase of it. I find some of the higher classes recommending it in order to evade income-tax.

7360. You would not recommend an increase of the salt-tax as a substitute for the income-tax, would you?—No, certainly not.

7361. You spoke of a time when opium was unknown to the Hindus; what time was that?—I think the limit of the general knowledge of it, I should fix at about a century. I have not gone very much into the history of it, but I have not found opium noticed in the literature.

7362. Whence had they first their opium?—It must have been from the Mohammedan countries to the north; as no doubt from Turkey and Arabia.

7363. Mr. Eastwick.] Even if the use of opium could in any way be stopped, would not the natives immediately have recourse to various other intoxicating things, such as bhang?—Yes; they would take to bhang, no doubt; but the smell of it is more disagreeable than the smell of opium, and I do not know that in their families they would have much encouragement to take bhang. I have perceived particular injury in Seinde from the bhang, where among the fishermen many have lost all their hair from the use of it.

7364. In fact it is quite as injurious as opium?—Yes. It is even mentioned as an injurious ingredient in the Parsee sacred writings. I have met notices of it in the Zend writings.

7365. You stated just now that you thought the use of opium came in about a century ago; but perhaps you will remember that some of the Emperors of Delhi used it to extinguish rivals by giving them doses of opium?—Yes; I made an exception about the emperors and the rulers of the Mohammedans.

7366. Would you not say that it had probably been introduced from Persia?—From Persia, Turkey, and Arabia, undoubtedly.

7367. You remember, of course, that when you first went out to India the prices of things were very much lower than they are now?—Yes.

7368. And at that time did you find that the natives complained less of taxation than they do now, or what is now your idea on that subject?—I do not think that the natives in the West of India complain much of taxation. The revenue settlement is very agreeable to them. And during the time of the Mutiny, I had occasion to feel the pulse of the Mahratta population with a view to report upon it; and I found that they had resisted the emissaries of the Nana by saying that they were much more comfortable under the British Government, better provided for in every respect, and able to carry on their operations in peace, and freed from a great many of the arbitrary taxes that they had before.

7369. You would attribute that amelioration

of condition partly to their improved condition, and partly, I suppose, to the money that was introduced by the cotton?—Yes; there has no doubt been a great introduction of money into Western India by the cotton.

7370. And I suppose that the natives could better bear a greater taxation now than they did formerly, and even an increased taxation compared with what they have?—Yes, they could bear it; but we must keep faith with them in reference to the settlement made; in some form or other they could be reached by taxation now better than they could be reached before.

7371. Your general experience is, that they do not complain now?—Yes; that is my experience, and I am very familiar with the Mahratta peasantry.

7372. Mr. Candlish.] What do you consider it was that led to that increased cost of the articles produced in India?—At the time of the expedition to Persia before the Mutiny, many things in the Bombay Bazaar rose to extravagant prices, and they have since scarcely fallen.

7373. What articles?—Articles of food, and food for horses, and so on.

7374. How is it that they have not fallen; with regard to the food for horses, that would be a large temporary want?—Yes; but it continues, notwithstanding.

7375. But being a local want, in point of fact, would it lead to a rise throughout India?—I think there has been a rise in other districts; in the Central Provinces there was undoubtedly.

7376. You would not put those things in the relation of cause and effect; would you?—I think that the exportation of food from India on that occasion had a sensible effect; and then, when the Mutiny broke out, the commissariat required very extensive supplies; and when the Abyssinian War occurred they required supplies. But what the effect of these temporary demands being withdrawn may be, I cannot say distinctly.

7377. Can you say what the rise has been between 25 years ago and the present time?—The cost of keeping a horse now is more than double what it was in Bombay when I went there first; and I think that human food has risen in proportion.

7378. Double throughout India, do you mean?—I am not able, except by inference, to speak of the other portions of India.

7379. Has the wealth of the great mass of the population in the Bombay Presidency increased?—Yes, undoubtedly; they are in much more comfortable circumstances than they were, and particularly the agricultural classes.

7380. You think that increased taxation would not be increased pressure?—It has not been much felt in the Mahratta and Gujerat countries. A great many persons, in consequence of the demand for labour in Bombay connected with public works, have come into the place from the adjoining districts under the native chiefs, and their appearance on the scene has increased the demand for certain articles.

7381. Mr. J. B. Smith.] You have had great experience in India, and have travelled over large portions of it?—Yes.

7382. What is your opinion as to the feeling of the natives towards our Government; is it as favourable as it is towards the native Governments?—Much more favourable; I have been followed for days by natives begging me to make a representation to the effect that they wanted to be transferred to our Government.

7383. You

7383. You think that arises from the feeling of the sense of security and justice under the English Government?—Yes.

7384. *Sir Charles Wingfield.*] What part of India do you refer to?—To the west; but so far as I have noticed in other portions of India, I would say, generally speaking, there is a greater confidence in our Government than in the native Governments.

7385. You attribute that mainly to the fact that there is peace in one, and not the same security in the other?—Security is one element in it, and prosperity is another element in the case, and appreciation of justice.

7386. But perhaps you are aware that before the Mutiny, before the annexation of Oude, all classes of the Oude population used to emigrate to the British territory?—Yes; but they were particular classes in Oude that made a hostile movement against us.

7387. But all classes emigrated to the British territory, rich and poor, great landowners and small, and when we annexed the country they all came back to Oude, and yet a year afterwards the whole country rich and poor was in insurrection against us?—I am not, from my own observation of that district, prepared to express an opinion on it. I could explain the matter theoretically; I think it would be quite possible to deceive masses of the people by holding out inducements to them; I think that the zemindars made promises to them, or made appeals to them as much as possible to excite them.

7388. Probably the chief motive for preferring the British rule is simply that there is order and security under it?—Security and prosperity.

7389. *Mr. Haviland-Burke.*] Do you think that you perceive in the course of your experience widely increasing attention on the part of the natives to the incidence of taxation?—Yes; young men, those who are educated particularly, are discussing the matter with much interest, and the classes that expect in some form or other to have the incidence of taxation fall upon themselves are expressing their opinions not in a very patriotic spirit, but in a keen spirit.

7390. You mentioned incidentally the subject of Abyssinia; have you heard any expression of opinion as to any portion of the taxation that might be necessary in consequence of the Abyssinian War being borne by India?—I do not think that India felt very much involved in the matter, except as a mere matter of prestige?—The Abyssinian affair was placed under the political administration of the Home Government; it was reckoned more a matter of a concern for England than for India, but it would have been very injurious to have our prestige in the East damaged.

7391. I understand you that the native population generally concurred in the policy of that war?—Yes, as far as I have noticed.

7392. And also that they had a considerable knowledge of the circumstances of that war?—They saw that England was placed at a great disadvantage in having its representatives im-

prisoned and mistreated, and no doubt if relief had not been extended to them, they would have formed a very unfavourable impression both of our power and of our sympathy.

7393. *Mr. Grant Duff.*] Have you ever considered the financial aspect of the opium question?—Yes, I have; I have felt it to be a very serious matter; I think it a dangerous thing for the Government to be dependent on the opium trade for such a large sum as it yields. In fact, it is alarming, considering the changes that may soon occur in this matter.

7394. Supposing that we are to adopt your plan, and to have the Bombay system instead of the Bengal one introduced into Bengal, do you think that we should get as good a revenue or not?—I think that you might secure the same revenue, and prevent a great deal of the speculation and wagering that now occurs in connection with the matter; because the native merchants are constantly looking to the sales at Calcutta and regulating their prices by the results there, and the amount of speculation and of wagering is really very great.

7395. Then you agree with those who think that we should get a not much worse revenue, and a considerably steadier one by your plan?—Yes, the revenue would be steadier, and we should not be so responsible for the arrangements as we are at present.

7396. You mentioned some cases which had come within your knowledge, of native princes or large proprietors, who had suffered much from the use of opium?—Yes.

7397. But how could you directly trace their sufferings to opium; are you quite sure that there were not other causes?—I was told it by their own officials, and when in their presence I have smelt it, and I have seen them quite stupefied by it. In the last visit I paid to Poonah, I observed one of the chiefs of a particular province, lifted into a carriage on the railway, in a silver chair, nearly perfectly stupefied by opium, and scarcely able to recognise his friends. And I have known others injured by it to a great extent.

7398. *Sir W. Lawson.*] It has a paralysing, strong effect?—It has, when taken habitually, it both excites and paralyses.

7399. *Mr. Eastwick.*] It is possible that some of those cases may have been cases where opium was taken to relieve suffering from other diseases?—I do not know how they began.

7400. *Mr. Haviland-Burke.*] You were not in personal attendance on any of these cases?—No.

7401. To a certain extent it was hearsay?—And, ocular perception.

7402. *Mr. Beach.*] However much individuals may have suffered from the use of opium, the consumption of it has not generally increased in India has it, considering the length of time that its cultivation has existed?—It is increasing, and I have even found European ladies afraid of their ayahs giving opium to their infant children to make them sleep.

Rev. J. Wilson, D.D.

16 June
1871.

Sir HENRY LACON ANDERSON, K.C.S.I., called in; and Examined.

7403. *Chairman.*] To resume the inquiry of the Committee into the sources of the revenue, I will direct your attention to the item in the general account, for 1869-70, of stamps producing 2,379,316*l.* for that year. Will you be good

enough to explain to the Committee what is the nature of the stamp duties producing this amount?—The first item is the sale of impressed paper, which amounts to 2,148,203*l.* The second item is the sale of adhesive stamps; it amounts to 63,890*l.*
The

Sir H. L. Anderson, K.C.S.I.

xx2

Sir H. L.
Anderson,
K.C.S.J.
16 June
1871.

The third item is the duty on impressed documents, that is, on commercial documents which are prepared by a bank or firm cheque books, for instance, which are sent to be stamped; that amounts to 66,308 *l.* Then fines and penalties amount to 3,882 *l.*; recoveries of stamp duties from pauper suits, where the paupers gain the suits, 5,436 *l.* Then there is "Miscellaneous," which I fancy are savings in the department from vacancies and small items, making 3,709 *l.*; that makes the total of 2,379,316 *l.*

7404. Will you be good enough to state what is the nature generally of the impressed paper that was sold?—The stamps are divided into general or documentary stamps, and judicial stamps, which by law are now called court fees in order to distinguish them from the other, and I hope that hereafter they will distinguish them in the accounts, that they will appear under "Law and Justice."

7405. Have you the amount of the judicial stamps?—No, not exactly; but I believe out of the total of 2,379,316 *l.*, it is about 1,400,000 *l.*; it is the larger item of the two.

7406. Are those judicial stamps regulated by an Act relating to the administration of justice?—They are regulated now by an amending Act passed last year, Act 7 of 1870. That Act was passed to amend the former law, the 26th of 1867, which was passed by Lord Lawrence's Government with a view of increasing the judicial revenue in order to meet the increased sum which was given to the subordinate grades of the judicial administration, the native judges and their establishments; they computed that it would amount to about 300,000 *l.*; it did not, I believe, in fact amount to as much as that.

7407. Could you give us a general outline of the raising of this revenue by judicial stamps; what is the general principle upon which the judicial stamps or court fees are imposed?—What is called the initiation fee is the chief thing. When a man brings an action he cannot be heard until his plaint is upon a stamped paper of a certain value.

7408. Is that upon a per-centage of the sums sought to be recovered?—Yes.

7409. Can you state whether that has undergone any change in a recent period?—By Act 26 of 1867, which was amended by that of last year, the revenue was very much increased on initiation fees. The increase was 25 per cent. in revenue, although the suits fell off 14 per cent., and you may say 20 per cent., because they had increased always about 5 or 6 per cent. in every year; but in that particular year, when this Act came into operation, there was an absolute decrease in the number of suits of 14 per cent., and you may say 20 per cent. with what they expected it would have increased; but there was an increase of revenue of 13½ lacs, or about 25 per cent.

7410. Can you give us any idea of the rate that was imposed before 1867, and the increased rate per hundred rupees imposed then?—The Act of 1867 imposed a stamp of 10 per cent., 10 rupees per hundred, and it took nothing under one rupee. If a man brought an action for five rupees, he had to pay one rupee for the stamp; that in the revised Act is very much improved; it is now 7½ per cent., and the same rate down as low as five rupees; upon a five rupees suit, for instance, it is six annas, and upon a 10 rupees suit it is 12 annas.

7411. Then it is a uniform rate of 7½ per cent.,

decending down to five rupees?—Yes, and then there is a maximum of 3,000 rupees. There have been cases known in which very large sums were paid as initiation fees; I believe that there is a case in Calcutta where 8,000 *l.* was paid for a stamp.

7412. That was when there was a per-centage to an unlimited account?—Yes, and there was a Madras case, where 3,200 rupees had to be paid. Now they enacted that it shall be 300 *l.* and no more.

7413. In addition to the initiation stamp or fee, is there a system by which stamps are taken in interlocutory proceedings in the cause?—No; after a decision is given, a man may have to pay for a copy of the decree. If he sues on a bond, it must, of course, be on a duly stamped bond.

7414. Has that change been introduced by the Act of 1867, that the one fee covers the whole?—No; every Presidency had formerly its own stamp law, and in 1860 there was the first general stamp law, and then the initiatory fee covered everything.

7415. And that was a uniform law for all India?—Yes, that was uniform for all India.

7416. Do you know whether, under these laws, the stamp duty, apart from the increase of 1867, was increasing steadily?—Yes, I think it was. The litigation was increasing every year; there were more cases every year; they increased about 6 per cent., consequently there was an increased stamp revenue.

7417. That steady increase was very much deranged by the changes of 1867 and 1870, was it not?—By the change of 1867 the increase of revenues was very considerable; and then all the courts represented that they thought the charge was too great; that it was unduly repressing litigation, in fact.

7418. And we have hardly had any experience of the operations of the Act of 1870?—Hardly any; but I fancy that it is approved by everybody; it is a very admirable Act.

7419. We do not know the effect of it on the revenue yet?—There would be at first a deficiency; the calculation is, that they will lose in the first year eight lacs of rupees; they will lose more, but they calculate on an increased amount of litigation. I ought to mention that by the last Act 7, of 1870, they enhanced the stamp duty upon probates of wills, and take 2 per cent. like the English rates. That will yield three lacs. Therefore they think that five lacs will be the net loss.

7420. Will that be represented by the judicial stamps?—Yes, the court fees or the judicial stamps.

7421. Do you know what is the proportion to the contribution to this amount out of the small suits as compared with the large?—Yes, I think that one-sixth of the entire litigation of the country is on cases which only involve 10 rupees or under.

7422. Do you mean one-sixth in amount or in number?—One-sixth in number. In fact, I may say this: that it has been calculated, that out of a little upwards of 700,000 suits, less than 10,000 are for sums exceeding 100 *l.*, and that one-sixth of the whole are for sums not exceeding 10 rupees.

7423. Would you infer from these circumstances that this stamp duty is a pretty certain source of revenue?—A very certain source. You must expect that in the first year or two there would be a considerable decrease; I said about five lacs, but I think then it would recover itself.

itself with the prosperity of the country, which always implies litigation.

7424. Now, with regard to the other items of stamp revenue that you have mentioned, will you explain the items of stamps not judicial?—As I said before, before 1860, each Presidency had a Stamp Act of its own, and then the Act of 1860 was slightly amended by Act 10 of 1862. That remained on till 1869, and in 1869 there was a new Act. The complaint against the old Act was that its provisions were very confused indeed, and a man hardly knew what stamp he had to pay; and also the other great difficulty was that if a document was insufficiently stamped, the only person who could impound it was the Collector. There was a great difficulty in bringing a man to justice in that way for fraudulent evasion. So, by Act 18 of 1869, every judicial officer was authorised to impound an insufficiently stamped document.

7425. Has that had the effect of rendering the use of stamps more general and according to the law?—Yes, I think so; I think that the revenue from general stamps, apart from the judicial stamps, is increasing.

7426. Can you give any general outline of what the general stamps consist of?—They are of two kinds; there is an *ad valorem* class and a fixed class. The instruments which are chargeable with *ad valorem* stamp duties are bills of exchange and promissory notes payable otherwise than on demand, and policies of insurance (I ought to mention that the stamp duty on policies of marine and fire insurance has been very much reduced by the late Act, and on life insurance entirely abolished), and customs bonds, and bottomry bonds, and mortgage deeds, and conveyances, and leases, and appraisements or valuations; these are all stamped *ad valorem*. And then there are a number of other documents, such as bills of exchange, promissory note, cheque or order, for payment on demand of an amount exceeding 20 rupees, letter of credit, bill of lading, shipping order, notarial act, and power of attorney, and each of them has a fixed duty.

7427. Are those duties generally small?—Yes; on a bill of exchange, for the payment of a sum on demand, it is a fixed sum of one anna; on a bill of lading it is four annas; on a notarial act it is two rupees; on a power of attorney to present for registration it is eight annas.

7428. What are the per-centage duties?—On a bond it is at the rate of one-half per cent., rising by certain gradations always upon the higher sum. For instance, take 25 rupees; it will be 2 annas instead of 8, and on 50 it would be 4 annas, and on 100 it would be 8 annas. Then it goes on for each hundred, with a rise of one-half per cent.

7429. That is between 100 and 200, and so forth?—Yes, that is for bonds, and double that amount for conveyances.

7430. Do you mean on sales and purchases?—Yes.

7431. Is there any stamp on the transfer of personal property, such as shares?—Yes, certainly.

7432. What is the per-centage charged on transfer of property of that kind?—Transfer of a share in a company or association, when the amount paid for such share does not exceed 100 rupees, four annas. For every 100 rupees of such amount, or part thereof, in excess of 100 rupees up to 1,000 rupees, four annas; and for

every 500 rupees of the same or part thereof, in excess of 1,000 rupees, one rupee four annas.

7433. Do you know whether the revenue from the general stamps is derived in any particular proportion from the smaller as compared with the larger transactions?—It has been computed, and it is a fair estimate, that one-quarter of the general stamp revenue is derived from stamps not exceeding 8 annas in value; that is to say, from the smaller transactions.

7434. Does this stamp law now extend to every part of British India?—Yes, all India.

7435. Do you think that there is at present much evasion of it?—I think not now. I think the present stamp law is a very fair one; I mean the general stamp law. The court fees, or judicial stamps, I think were unjustly high, by the Act of 1867, but were made right by the Act of last year.

7436. Do you know whether the revenue from the general stamps has been increasing steadily?—Yes, I think so.

7437. Do you anticipate that there will be a steady increase of them?—Yes; I think as the prosperity of the country increases, the general stamp revenue will increase.

7438. There is an item of 42,893 *l.* for drawbacks, and 100,913 *l.* for the charge of collection of those stamps; do you know what that represents?—There are the various superintendents of stamps and their offices. There is one in each Presidency, and he has a considerable establishment, and there are also throughout the country stamp vendors who get a per-centage; 5 per cent., I think, on sales.

7439. Do you know whether the stamps can be easily obtained throughout the country by those who want them?—Yes; very easily.

7440. Have you any opinion as to the effect of the stamp law as tending to repress false and fraudulent documents?—Decidedly.

7441. You think that it has a beneficial effect in that way?—Certainly, beyond all doubt.

7442. Mr. Cross.] I think I understood you to say that there was no *ad valorem* duty on stamps or bills of exchange?—On bills of exchange and promissory notes for sums payable on demand the stamp duty is fixed; but, on a bill of exchange, payable otherwise than on demand, it is *ad valorem*.

7443. Could you give us the amount?—“When the amount of the bill or note does not exceed 100 rupees,” it is 1 anna, which is about 1 *d.*; and it is also provided that, “If drawn in set of two, for each part of the set it is 1 anna.”

7444. Mr. J. B. Smith.] On foreign bills of exchange, what is it?—Foreign bills of exchange must have the necessary adhesive stamp or stamps affixed to them before negotiation. But I ought to mention that when the Bill was first introduced into Council, two mercantile members of the Governor General's Council objected to some of the provisions, and they were altered according to their opinions, by the Select Committee. The Bill, as amended by the Select Committee, was sent to the different Chambers of Commerce, who all approved of it, and I believe it has given satisfaction to the mercantile community.

7445. Did I rightly understand you that the tax on lawsuits amounted to 7½ per cent?—Yes, what is called the initiation fee.

7446. Is not that a heavy charge?—No, I think not; you see that the people are fond of litigation. It was 10 per cent., and has been reduced to 7½.

1871.

7447. Then it tends to act as a sort of check upon litigation?—To some extent; the administration of justice is a very costly thing in India, and I think that the object of the Government has been to recoup themselves as much as possible.

7448. This tax does not quite recoup them?—No.

7449. Mr. *McClure*.] Is that duty paid by the person bringing the suit?—Yes.

7450. When the suit is settled, what then?—If the plaintiff gains the suit the fee may be levied as costs from the defendant. I mentioned that it used not to be limited, and then enormous sums were paid sometimes, but now the law is that 300 l. is the maximum.

7451. Mr. *Fawcett*.] What is the stamp duty when there is an appeal?—In a plaint or memorandum of appeal, "when the amount or value of the subject-matter in dispute does not exceed five rupees," it is six annas. "When such amount or value exceeds 100 rupees, for every 10 rupees or part thereof in excess of 100 rupees," it is 12 annas, up to 1,000 rupees.

7452. *Chairman*.] Is the same scale continued then?—No, not quite the same. "When such amount or value exceeds 1,000 rupees, for every 100 rupees or part thereof in excess of 1,000 rupees up to 5,000 rupees," it is five rupees. It decreases when it gets very high. "When such amount or value exceeds 20,000 rupees, for every 1,000 rupees, or part thereof, in excess of 20,000 rupees up to 30,000 rupees, it is 20 rupees, and then the maximum is as in the other, 3,000 rupees, or 300 l.

7453. Is it the same in every appeal court?—Yes.

7454. Mr. *Fawcett*.] How many appeals may there be in one of these pecuniary suits?—There may be one regular and one special appeal.

7455. So that it may amount to 15 per cent. for the appeals?—It may do so, that is for original suit and appeal.

7456. Have you ever compared this taxation with the taxation that is levied in other countries; for instance, the fees in England?—No, I have not, except in the most cursory manner; the system of the law courts here is so entirely different; there is no initiation fee.

7457. What I mean is, whether the principle is adopted that justice should be made to pay for itself in India?—I think that is the object, that justice should pay for itself; it does not do so, but that is their object.

7458. So that, in considering the aggregate taxation imposed, upon the Indian people, have you to make this difference in the comparison, that whereas in England justice is included in taxation to a great extent, in India it represents payment in addition to taxation?—No; I think in India, the taxation is intended to meet the charge for the administration of justice. I do not think that the Government seek to get a revenue out of it.

7459. But then it seems to me that the difference between the two is this, that the justice in England is paid for by general taxation, is it not; whereas justice in India is, as you say, paid for very nearly by the fees charged?—By the litigants; but not entirely.

7460. Then, for instance, the revenue that is levied in England amongst other things that it provides the country with, such as army and navy, provides it with justice; but in India the revenue does not provide it with justice; and that has to be provided from other sources?—That is in some degree true; but then the disbursements from a private individual's pocket are less in India. The cost of law in this country to the individual is what he pays to his solicitor.

Tuesday, 20th June 1871.

MEMBERS PRESENT:

Mr. Ayrton.

Mr. McClure.
Sir David Wedderburn.
Sir Charles Wingfield.

THE RIGHT HONOURABLE ACTON SMEE AYRTON, IN THE CHAIR.

Sir HENRY LACON ANDERSON, K.C.S.I., re-called; and further Examined.

7461. Mr. Fawcett.] I UNDERSTAND from the tenor of your last answer on the previous day that you consider that the Indian suitors do receive some compensation for these high fees which they have to pay, in the form of stamp duties, from the fact that the other law charges, such, for instance, as fees to solicitors and other fees, are less in India than in England?—Certainly, in the district courts.

7462. But with regard to the Presidency towns, is that the case?—There on the original side of the High Court they have the English system. A man goes to his solicitor, and I could not tell the expenses of that; it is not known to the general public; but I believe that the rate of fees to solicitors and barristers is higher there than it is in England; for instance, where you give a guinea, it is 15 rupees, a gold mohur.

7463. May I place a letter in your hand and ask you to read the part that I have underlined, and then I will ask your opinion on it. That letter is written by a very eminent barrister who has lived in Calcutta, and I will ask you whether it is correct?—"In the Presidency towns the system of legal fees is the same as it is here; that is to say, there is a scale laid down by the court which governs attorneys' charges in record business. This scale is in Calcutta decidedly higher all round than in England;" yes, I think that is true.

7464. You think that it is true that suitors not only have to pay in court these extremely high fees to the Government, but also in addition the whole cost of the lawsuit is greater in the Presidency towns than it is in England?—I think it is; but I do not think that you can say that the stamp duties are very high even, in the Presidency towns. I do not think that 7½ per cent., with a maximum of 300 l., is a very large charge.

7465. But I understood you to say that, for instance, if there was a suit for 100 l., and if there was an appeal (which possibly there might be), independently of these law charges to attorneys and barristers, 15 l. out of the 100 l. is taken

by the Government?—It may be; but the party who appeals may not be the same party who brings the original action, but it must be paid by one or the other.

7466. Then when you consider the cost of justice to the people in India, you ought, fairly, ought you not, to consider the enormous and necessary expense which they are put to if it is necessary for them to appeal to the English Court of Privy Council?—An appeal to the Privy Council can only be made when the sum in dispute is 1,000 l. and upwards. Those are very exceptional cases, indeed; and the only reason why they make so many appeals (they all, with very few exceptions, come from only one court, the Calcutta Court) is because the Bengalee is such an exceedingly litigious person.

7467. Still, the fact that I want to bring out is this, that notwithstanding the very heavy taxation which is imposed in India, it does not supply the people with justice, but they have to pay very high fees in addition, unusually high fees, and if they wish to obtain justice from the ultimate Supreme Court, the expense which they have to go through is enormous?—I think not enormous; I think you must draw this distinction, that what your informant says chiefly applies to the original side of the High Court where the English system is administered, and it is administered according to English ways. But you are speaking now of the appellate side of the High Court, and I do not think that the rates there are so very high. There you may be represented by a native, but it very seldom happens that the two rates apply, the high fees which that gentleman speaks of and the stamp duty, because the high fees are on the original side, and not on the appellate side.

7468. But it is usually supposed that one of the great advantages which the English rule has conferred on India, an advantage which, it is supposed by many people, compensates the Indian people for increased taxation, is that we make property more secure than it was under their native rulers?—Yes.

Sir H. L. Anderson,
K.C.S.I.

20 June
1871.

Sir H. L.
Anderson,
K.C.S.I.
—
20 June
1871.

7469. But do not we, if law is as expensive as it appears to be, give them that security of property at an enormous cost?—I do not think it is at a cost at all equal to what it costs in England. I do not think that you can say that 7½ rupees per cent. is a very large sum to cover everything except on appeal. Then a man has to go through another process, but if he gains his suit, he gains the costs too.

7470. This letter from which you have read a sentence was written to me by a Mr. Doyne, a very eminent barrister, who was in practice for a great many years in Calcutta; and his opinion goes to this, that not only is this heavy percentage of 7½ per cent. levied before the suit commences, but in order to carry out that suit, all the other legal charges are higher in India than they are in England?—My opinion is not equal to Mr. Doyne's in the matter, but I think that he is alluding to the fees on the original side of the court. It is a new suit in the High Court. The High Court is the old Supreme Court and the old Sudder joined together. Those high fees in a very large degree apply to the original side, and not so much, I think, to the appellate side. I dare say that they are pretty considerable there, but not so high as they are on the original side.

7471. But later on in the letter that I have placed in your hand, I think you will see that his opinion is that the changes in the court to which you refer, the Mofussil Court, are also large?—"In the Mofussil or out of the Presidency town the pleaders are allowed to make their own clients what bargain the parties please, and I think that beyond question the cost of litigation, when at all intelligently conducted, is high. But it would be very difficult to say its relative cost, when the range of charges is so considerable according to the wealth of the client, and the importance of the case; I know that enormous fees are frequently paid. In the lower courts, such as the Moonsiff's, and the Deputy Collector's Court (the latter in rent suits), the fees are often small, being in the nature of a poundage, but even then the sums which a suitor has to pay in various other quarters make litigation costly."

7472. I am justified in saying that he considers that litigation is costly even in those courts to which you refer?—In some cases it is no doubt. For instance, a native in an important suit will bring down a barrister specially from Calcutta; I dare say Mr. Doyne himself has often been taken down, and has received a very large fee; but when a man is entirely pleasing himself in doing that. Mr. Doyne is quite right (at least, I believe it to be so), that a man generally makes a bargain with his own representative; but I confess that I have never heard any great complaint of the cost of law in the Mofussil of India.

7473. Do not you consider that with regard to the cost of justice, the present delays in obtaining justice on appeal in England are felt to be a grievance by the Indian people?—That of course amounts almost to a scandal at present. There is a great difficulty in the matter; the mere fact of making an appeal, which appears a very easy thing, is a matter of the very greatest difficulty. Out of the nearly 700 appeals since the courts were established in 1862, I suppose 650 are from Calcutta, if not more; but when a decision is made by the High Court of Calcutta, an appeal has to be made to the Privy Council, if it is about 1,000 £, in six months; then the proper officers of

the court have to make two exact copies of the whole of the proceedings, and of every document exhibited in the cause, with translations of all these; therefore it takes an immense time sending home a heavy case, because in the Court of Calcutta they do not translate the whole case, but only what the barristers on either side consider material parts.

7474. But in addition to this enormous expense, which you may say is necessary for the translation of these documents, when the case is ready for judgment, a great additional expense is thrown on the suitor, from the fact that the case is not heard?—A block is now established in the Privy Council, and men now appeal, not because they have any chance of gaining the suit eventually, but in order to put off the time of the execution of the decree; and therefore the block increases.

7475. Therefore without blaming any particular person, you would say that the result of the present system is, that it causes an amount of expense and delay in these appeals which, to use your own words, amounts to a scandal?—I think that the block that there is in the Privy Council at present is a matter to be very much regretted. There has been a committee at the India Office lately sitting, in the hope of trying in some measure to reduce the number of appeals. At present, if it is a question of 1,000 £, a man is allowed to appeal, whether upon fact or upon law; and one suggestion thrown out is, that every case which is appealable to the Privy Council should be tried in the High Court by three judges sitting together, one of whom should be the Chief Justice; that if they confirm the decision of the court below upon a matter of fact, their decision should be final, but on a matter of law, there should be an appeal to the Privy Council. It seems almost an absurdity for the Privy Council to decide upon a matter of fact, when they have not got the witnesses before them.

7476. Mr. Birley.] Is the charge of 7½ per cent., which I understand is the Government tax, supposed to cover the whole necessary cost of litigation?—The whole of that part which comes to the Government; there is what a man pays to his own adviser in addition.

7477. Nothing of that kind is included in the 7½ per cent.?—No.

7478. No; the expense of witnesses?—No; but they are summoned, and they get four annas a day, I think.

7479. I understand you to say that 7½ was not a heavy charge upon the recovery of money by a lawsuit, but it is entirely independent of all that the litigant has to pay for his own adviser?—Yes; that he does by private contract, and that we have nothing to do with.

7480. Is the scale the same in the capital of the Presidency as in the Mofussil?—There is the same charge throughout the whole of India in the Mofussil.

7481. And also in the capitals of the Presidencies?—Not in the High Court; the High Court is the appellate court.

7482. What is the rate of tax there?—Under 100 rupees it is 7½ per cent. up to 1,000 rupees, and then it is 5 per cent.

7483. Then is it with regard to the Mofussil; there you speak of a maximum of 300 £.?—That is the same as in the High Court.

7484. And then it goes down to 5 per cent.?—Yes.

7485. Does

7485. Does the rate of tax diminish as the value of the property concerned increases in the Mofussil and in the High Court beyond 5 per cent.?—Not beyond 5 per cent. When you get above a 1,000 in the Mofussil, then it is 5 per cent.

7486. But never less than 5 per cent.?—No; except that there is a maximum of 3,000 rupees.

7487. Then that throws a proportionate heavy charge upon the poorer litigants, does it not?—That is, you know, you are throwing the net to catch the smaller fish, as it were. It used to be the case that a litigant could not pay less than a rupee, but now, by the excellent Act of last year, they have reduced it. If it is for five rupees, it is six annas; if under 10 rupees, it is 12 annas. Now one-sixth of the litigation is on sums of that kind.

7488. In regard to appeals, you said that the block increased appeals, because many litigants appeal in order to delay the carrying out of the judgment?—Yes.

7489. Has it also a contrary effect; does it deter appeals from honest litigants?—Not at all, I think; the appeal must be for 1,000 L. to the Privy Council, and all the appeals, with a very small exception, come from Calcutta, and I do not think that the Bengalee cares twopence about the expense. They are generally wealthy people, and they are fond of law.

7490. It is merely as a luxury that you look upon it?—I look upon it as an entire luxury; I want to restrict it to points of law; I should be very glad to see the appeal to the Privy Council restricted to questions of law.

7491. Then, in fact, you think that the system of appeal is rather injurious to the morals of the people?—It is a very small class who do appeal to the Privy Council. I cannot say that the morals of the people are affected by it.

7492. Mr. Bourke.] The 7½ per cent., as I understand, is what is analogous to what are called court fees in England; nothing else?—Yes, they are paid by judicial stamps. By a late enactment, in order to distinguish them from the general stamps, they call them court fees; that is, initiation fees.

7493. Sir T. Bazley.] Are the stamp taxes in India, speaking generally, paid chiefly by the affluent classes?—I should think that the general stamps are paid more by the affluent; but I think one-fourth of the general stamps are stamps of eight annas and under.

7494. And these are exacted for what purpose?—For bills of exchange, cheques, and every kind of instrument.

7495. Do those exactions curtail the labour employed in any way?—No, I think not; the only stamp that a labouring man has to pay, unless he brings an action against another labouring man, would be a stamp upon a petition.

7496. But do the exactions upon the wealthy classes diminish their liability to employ the labouring classes?—Not the general stamps, I think, at all.

7497. Mr. Caudlish.] You say that the appellants are usually the wealthier classes?—The appellants to the Privy Council, not the appellants to the High Court.

7498. Was it of them that you spoke when you said that they appealed to delay execution of the decree?—Yes.

7499. What is the object of the appeal; why

should there be a desire to delay execution if they are men of means?—Whatever means he may have, no man likes paying money if he can possibly help it; but beyond that there is so much pride that enters into it. A law suit which is carried by appeal to the Privy Council is generally a matter on which there is a great feeling beyond the mere desire for money.

7500. And that is a further reason, in addition to the desire to delay execution?—Yes; a man says I will not be beaten.

7501. Chairman.] The next item to which I wish to direct your attention is that of "Law and Justice," the gross receipts for which are 801,954 L.?—The first item is sale proceeds of unclaimed intestate property, which amounts to 14,316 L.

7502. The property of persons who die without any known heirs or kindred?—Yes.

7503. Do you know what becomes of that property generally; is it ultimately claimed, or what is the result?—If there is any intestate property, or any property unclaimed, the native officer in whose district it is has to report to the collector, who issues proclamations which are affixed to the chief buildings in various parts of the district, and any parts where he thinks it is likely that heirs may be found, and it is retained for a year. Then the collector reports to the High Court that such a property is retained, and asks what instructions they have to give. They may either say, "sell it," or they generally say, "keep it a little longer," and perhaps they advertise in another part; and eventually if no one comes forward it is sold for the benefit of the Government.

7504. What is the next item under Law and Justice?—Proceeds of Gaol Manufacture and Receipts of Convict Labour, which amount to 130,380 L.

7505. Is that the gross receipt?—The account has been somewhat imperfectly rendered; the different Governments bring these matters to account in different manners. Take Bombay for instance; there is nothing put down for the proceeds of the gaol labour there; but that must be because it did not reach the Treasury; it will come into the accounts of next year.

7506. Or is it because they deduct it from the expense of the gaol?—They may have done that, but I think it is more likely the other way. But I ought to mention that since this Committee was appointed, and I have found that the sums in these accounts are not quite the same as the departmental figures, I have proposed to the Financial Secretary to send out instructions that they should bring everything to account both on the receipt and on the expenditure side; because some Governments in some instances deduct the expenditure from the receipts, and only bring in the net.

7507. Do you suppose that this gross receipt for proceeds of gaol manufacture is exclusive of the cost of the material employed in the industry?—Certainly not; this is the net profit after deducting the cost of the raw material of the manufactured goods which are sold.

7508. You think that it is the net profit on the operation, except of course always the expense of the prison and the maintenance of the convicts?—Yes; and there is the convict labour too. The men are employed sometimes in public works and building operations for the Government.

7509. Then in those cases for the purpose of account for exhibiting the effects of useful labour,

Sir H. L.
Anderson,
K.C.S.I.

1871.

is any charge made for that work?—Yes; if the public works, for instance, apply for so many convicts, they are supplied to them, and then they debit their account with the price of this labour that is so many convicts at so much a day each.

7510. You think that they would be represented by a debit in the Works Department and a corresponding credit in this one?—Yes.

7511. You are aware that that is not done in this country; that there is no such thing as paying and receiving between public offices. Do you think that the other system prevails in India?—I do not think that they actually pay over the money, but they take the credit.

7512. But there is an actual entry?—Yes, I think there is an entry.

7513. Do you know how many prisons there are to produce this return of 130,000 *l.*?—Yes, I have got them in all the provinces. There, again, there is a difference, because some of the reports do not give the number of prisoners on the roll in the course of the year, but they give the daily strength, and some give both. For instance, in Bengal, the number of prisoners in 1869–70, was 74,751, and taking the mean population of the gaols, the daily strength was 19,984. Then I ought to mention that the death-rate is always a per-centage upon the daily strength, not upon the whole roll; a man may only be in prison three days or a week, or something of that kind.

7514. That would not give us any practical view of the general effect of this productive labour, because a great many of the prisoners could not be employed in labour?—Some are not sentenced to labour.

7515. Do any returns exist of the number of prisoners employed to produce this result?—I have got only an imperfect one. In Bengal the daily average of persons, I think, was 19,984; the daily average sentenced to labour was 17,387.

7516. But how many are employed in this labour?—8,252 are employed in manufactures; that is in the Bengal gaols, which, I think, on the whole, are the best in India in that respect.

7517. What is the out-turn of the Bengal prisons?—It is very considerable. Of the Mofussil gaols it is 217,700 rupees. Then there are 403 prisoners in Alipore Gaol, which is close to Calcutta, and is one of the best prisons in India; the net profits of that are 237,757 rupees, that is because they have a press there, and they employ the prisoners a great deal on this press, which is exceedingly profitable.

7518. Are they employed in doing Government work chiefly?—Yes, they make forms and printed statements for Government.

7519. And does that work out at the market rate to what you have stated?—The 403 prisoners, which is the number exclusively employed on the press, produced 237,757 rupees. Then the hire of convicts to the Public Works Department is 23,485 *l.*

7520. That 237,000 rupees would be the gross return, without deducting the expenditure for materials and stationery and other things?—No, those are the net profits. The net profits in the Mofussil are 217,700 rupees, and in the Alipore Gaol 237,000 rupees.

7521. But how would you reconcile that with the fact that the profits of the whole of the convict labour are only 130,000 *l.* for all India?—The two items which I have just mentioned are stated in rupees, not pounds. Many of the pri-

soners who are sentenced to labour are employed in the gaol for menial purposes.

7522. Do you suppose that in the prison account that value of the gaol labour is reckoned or not?—No, it is not.

7523. It would only be the value of the labour for outside purposes?—Yes.

7524. Can you state what the cost of the prisoners is; that would appear on the other side of the account, I presume?—Yes; I have the rate per head; the gross cost in the Bengal Gaol is 53 rupees per head per annum, and the net cost 36 rupees and a fraction.

7525. After deducting the return?—After deducting the labour fund.

7526. That would be spreading the labour fund over the whole prisoners of the Presidency?—Yes.

7527. Have you the accounts for the other Presidencies?—Yes; I have them separately, but the Bombay account is very imperfect indeed.

7528. Will you just give the result in gross?—In Bombay the total number of prisoners is 22,912, and the daily average 5,948, and the death rate 3 per cent for that year; the death rate for Bengal gaols being 5.15 per cent. The gross cost of maintenance per head in the Bombay gaols is Rs. 102. 13. 6., and the net cost 59 rupees.

7529. Do you attribute that great increase of cost to the increased cost of living in Bombay, or to the fact of the gaols being on a smaller scale?—I think that it is a great deal in consequence of the charges for supplies being so much greater in Bombay in the last few years. And there is also another point (I was on the Gaol Commission in 1864 when we examined several of the superintendents), that Bombay puts 22 rupees in its cost of maintenance for guards, and Bengal leaves it out, and does not consider that as a charge at all. Therefore you might say, taking the same course in Bombay, the gross cost would be about 80 rupees per head.

7530. But are the gaols in Bombay on as large a scale as those in Bengal?—I think about the same on the whole; but there are very many fewer in Bombay; there are only 22,912 prisoners in the one case, and in the other there are 74,751.

7531. But are there more prisoners in each of the gaols in Bengal?—No; I think they are pretty equally distributed in both. Of course the great evil of all Indian gaols is over-crowding.

7532. Have you the return for Madras?—I have Madras rather imperfectly. The daily average of prisoners is 9,933, and the death rate 3.90; the average cost per prisoner is Rs. 70. 6. 3.

7533. Would you anticipate any improvement in the receipt from the productive labour of the gaols, or do you think that it will be stationary?—I think there will be an improvement; it is not a source you can expect to get very much from, but I think it will improve. I ought to mention, to his credit, that Dr. Mouatt, who was head of the Bengal gaols, has done a great deal in that way, and I think that the others will follow his example.

7534. That has been an increasing item?—Yes; a slightly increasing item, and I think it will increase a little more.

7535. What is the next item?—The next item is the Judicial Tallabana Receipts; that is, the receipts for the service of process; it amounts to 70,174 *l.*

7536. Do

7536. Do you mean that the suitors pay that?—Yes, in civil cases.

7537. In addition to the initiation fee?—Yes.

7538. That being, in the first instance, paid by the Government?—Yes.

7539. That would appear in the expenditure on the other side of the account?—Yes.

7540. Then what is the next item?—The next item is Fines and Forfeitures; that amounts to 313,239*l*.

7541. Are those the fines and forfeitures levied in courts of justice throughout the country?—Yes; the magistrates' courts, and every court.

7542. Mr. *Fawcett*.] Forfeitures too?—I almost think that the fines and forfeitures are used as two words when one would do, but it may possibly mean the case of a man forfeiting his pay.

7543. *Chairman*.] Is there no forfeiture of goods in the event of conviction for crime?—Very seldom; I have hardly known such a thing.

7544. Then what is the next item?—The Registration Fund and Fees; that is 160,114*l*.

7545. What is that registration?—That is the registration of assurances; an Act was passed in 1864, which was a very comprehensive and minute Act, but that has been amended by an Act passed this year, which has hardly come into operation yet, but which is a more moderate Act than the one of 1864. The Government under the former Act of 1864, obtained a revenue from registration of about 25,000*l*. a year. They have distinctly stated that it is not their wish to gain a revenue from registration; all they wish to do is to recoup themselves for their expenses, with a margin of 5 per cent. to meet future pensions of the establishment; but under the old Act, which was repealed this year, they gained about 2½ lacs a year, and they had accumulated about 13½ lacs, that is about 135,000*l*.

7546. Mr. *Fawcett*.] This item of 160,000*l*. is composed of the annual income of 2½ lacs of rupees and the appropriation of the accumulation, is it not?—Yes, it may be so, but I do not think it is.

7547. *Chairman*.] Is this receipt intended to be a source of revenue, or to cover the cost of the operations of registration?—The Government have laid it down distinctly that it is not their object to gain a revenue from registration; they want to get a good record of titles.

7548. And the fees are with a view to cover the expenses?—Yes, which are very great.

7549. And those will appear on the other side of the account?—Yes.

7550. If the fees increase, I presume that the expenses will increase in proportion, so that the account will balance itself?—Yes; the fees are designed now with the idea of gaining about 5 per cent.; that is to meet future pensions of the establishment.

7551. What is the next source of revenue under this head?—The next source is one which accidentally comes into this year; it is Calcutta High Court fees, 87,513*l*. That is only an accidental thing; High Court fees are now paid by stamps, by an Act of 1868; before that they were paid direct. When I say High Court fees I mean those paid to the Government, I do not mean those paid to the sheriff.

7552. These are the fees which the Government receives, because the recipients of the fees are paid fixed salaries?—Yes; now those fees are paid by stamps. This amount is an arrear 0.59.

of the former year. The High Court Fees Act was passed in 1868, and this sum ought to have appeared in the account of 1868, but was not realised till 1869; therefore it appears this year, but that will not occur again.

7553. What is the next item?—The next item is a small sum of 2,267*l*. for stamp penalties under Act 10 of 1862, an Act which has now been modified by the recent Stamp Act; it is the penalties on presenting an improperly stamped document.

7554. Then what is the next item?—Then there are the Convict Receipts for Port Blair, 37,895*l*.

7555. What is that?—Port Blair is in the Andaman Islands; it is a penal settlement, and this sum is the proceeds of the work of the convicts.

7556. How is that work estimated, is it for goods sent away from the island?—No; chiefly for labour in the island, I think.

7557. On public works in the island?—Yes; it is all done by convict labour there.

7558. Is it only a convict settlement?—Yes, it was established since the mutiny; there are some manufacturers for their own clothing, for instance, and things of that kind.

7559. The expenses therefore would be enhanced to the same extent on the other side of the account?—Yes, the expenses are much larger than that. Then there is the usual item of "Miscellaneous," 10,725*l*.

7560. These make up generally the total sum?—Yes; those miscellaneous are small sums; for instance, old furniture may be ordered to be sold when new is bought. All those items together make up the 801,954*l*.

7561. I see there is a drawback or repayment of 29,000*l*.; do you know anything of that?—The total expenditure on law and justice is 2,993,000*l*.

7562. Mr. *Fawcett*.] Referring to the item derived from the profits of the gaols, I think you said in one of your answers that you were not quite certain whether it was a gross or a net receipt, because the accounts which the Government received were differently kept in different parts of India?—No, I do not exactly know. I find that Bombay is put down as nothing in the way of the gaol manufactures. Now I know that Bombay does produce a great deal in the way of gaol manufactures; therefore, either it did not reach Calcutta in time to be brought to account that year, or they have merely subtracted the proceeds of the manufacture from the general expenditure.

7563. But still, unless I misunderstood you, you could not tell us confidently whether with regard to the whole of India this was a net receipt?—What I have got down here is 130,000*l*. as a net receipt, that is after paying for the raw materials; this sum represents the proceeds of the manufactured goods sold, and therefore it is a net profit.

7564. I think you said when the question was first put to you, that the accounts were differently kept in different parts of India; in some parts the gross receipts being returned, and in other parts the net receipts?—What I said was this; the accounts, I think, are kept in the same way, but I think in sending them to Calcutta on some occasions, one Government sends the gross receipts, and another only sends the net, and another, if there is no profit, does not send it at all.

Y Y 2

I only

Sir H. L.
Anderson,
K.C.S.I.
—
20 June
1871.

Sir H. L.
Anderson,
K.C.S.I.
—
20 June
1871.

I only imagine that from there being nothing down for Bombay.

7565. But then when these accounts are made up at Calcutta from the accounts sent to them, if the Government receives in some cases the gross receipts, and in other cases the net receipts, are you quite certain that the Government in Calcutta before publishing these accounts, separates those that represent the gross receipts from those that represent the net receipts?—I ought to mention that these figures only represent the actual sums received, which came into the Treasury during that year. Sometimes a sum which belongs to 1869, will not be brought to account till 1870. I suppose every year something of the same kind will happen; therefore, one year will be like another, but these are the actual sums received.

7566. But are you quite certain, for instance, that the Madras Government in sending its accounts transmits the whole of the proceeds which they receive from the sale of goods, and that they get the money which is necessary for the purchase of the raw material required for the manufacture of them from another source?—They get the advance for the raw material from the Treasury.

7567. Then it would be a gross receipt and not a net receipt. I will put it in this way: suppose, for instance, the Madras Government sells 30,000*L.* worth of goods manufactured in gaols, and that in order to obtain that 30,000*L.* worth of goods they have to pay 10,000*L.* for raw material, if this aggregate amount is a net receipt, and not a gross receipt, they ought to transmit 20,000*L.* to Calcutta and not 30,000*L.*?—That is what the Madras Government does do, and, in fact, all the Governments, except that certainly Bombay has done nothing this year. They put down so much for the cost of raw materials, so much from the proceeds of sale of manufactured goods, and they subtract the one from the other, and consider that the net profit; they always do that.

7568. You are quite certain that they always do it?—Yes.

7569. But then there is something in the Bombay account you cannot explain?—Because I find that in this year there is nothing put down to Bombay; I know there is something there; I think it is that it will be found in the account for the next year.

7570. [Chairman.] Is it not possible that they may have deducted the net profits of the manufacture from the cost of the gaols?—They may have done that; they have not sent the net profit, but they have subtracted the net profit from the cost of the gaols, I think.

7571. Mr. Fawcett.] With regard to that item of 135,000*L.*, which arises from the registration of assurance fees, that is an item which you may say is an exceptional receipt which will not recur. Do you not think, in order to exhibit the finances of India in a correct light, considering that you, in India, have been steadily during the last few years living beyond your means, as a matter of prudence, when you have got an exceptional receipt like that, it would be better devoted to the reduction of debt than to income; would it not be fairer?—As I said before, they have an accumulation of registration fees of about 135,000*L.* Well, they may, if they choose, apply that to the reduction of debt.

7572. But would you not, as in the case of any ordinary business, think it a fairer way to

exhibit the accounts of India, and the financial position of India, and in a truer light, if an exceptional receipt of that kind was used so as to diminish the amount that you had to borrow?—It occurs every year up to this, hereafter it will not.

7573. This year you have an accumulation; you let it accumulate, and then you appropriate it?—No; that 160,000*L.* does not include the accumulation of the 135,000*L.*; that is the revenue derived in the year from the registration of assurances. The 135,000*L.* is the accumulation of the profit since 1864, about 2½ lacs a year. The income from registration of assurances is about 25,000*L.* more than the expense, and, therefore, a fund has accumulated of about 135,000*L.*; but that 135,000*L.* I do not think is a component part of this 160,000*L.* Unfortunately there are two sums of 135,000*L.* I see now, however, that it is "Registration Fund and Fees;" I thought that 160,000*L.* was the gross receipt for the year, but I observe that the word "fund" is there. If this be so, this is not the gross receipt for registration, but is a registration fund and the profit of the year; that is the 135,000*L.* accumulation and the profit of the year of 25,000*L.*

7574. Then, bearing that distinctly in mind, do not you think that it would be better if you exhibited the finances in that light, and told the world more correctly the exact position of India, if an exceptional receipt like that is put to income which never can recur?—Yes, certainly, if it is the fund; I should like to see to that point if you will allow me when I come here again; there is the word "fund," certainly.

7575. I understood the tenor of your evidence to be this, that up to the present time they had made too large a profit on these registration fees; that an Act of this year was passed, the object of which was not to make a profit from these registration fees, but simply to levy a sufficient amount from them to cover the expense, and to provide 5 per cent. necessary for pensions of the establishment, in addition?—That is partly the object of the last Act.

7576. They have made profits from them in past years, and they do not want to make any in the future; they find that the accumulation of the profits that they had made, according to your statement, amounts to 135,000*L.*; and that, according to your evidence, they have devoted to income, and have put it down as income?—Yes, from the fact of the word "fund" being used, I think it is so; but I confess that I have a doubt on the subject still.

7577. Assuming that it is so devoted, do not you think that such an appropriation of exceptional receipts to income at the time when money is being borrowed so far goes to exhibit* the financial position of India in an incorrect light?—No, I should look upon it as a casual source of income, if it is as you say, but it would make a very small reduction from the amount of the total debt; it is regarded as income in this particular year; it is a windfall.

7578. But then already I have discovered that the Government have appropriated, including this 135,000*L.*, in order to get the surplus this year of 118,000*L.*, what you call windfalls of nearly 900,000*L.*; therefore it becomes serious to appropriate windfalls at that rate, does it not?—They have appropriated the accumulations of the Police Superannuation Fund; that is the only thing which I am aware of.

7579. But Mr. Harrison, the Comptroller, admitted

mitted that 750,000 *l.* of some receipts were receipts that could never recur, but were windfalls. Adding this 135,060 *l.*, it would seem that during this year, when they have a pretended surplus of 118,000 *l.*, that surplus was obtained by appropriating exceptional receipt which never can again recur to the extent of 900,000 *l.*?—I certainly think that if this is the fruit of accumulations, it ought not strictly to be considered a matter of income.

7580. Who is responsible for these appropriations; would it be your duty, suppose that it had been pointed out to you, to call some one in your department to say, "This is an exceptional receipt, and I think you have just stated that for the sake of strict correctness and exactness it ought not to be devoted to income"?—If the facts are as you suppose, I do not think it ought to be.

7581. *Mr. Candlish.*] How would you separate it; how would you enter it in your accounts?—I have nothing to do with the accounts; it is entered in the account, but then it is perfectly understood that it is not a recurrent income.

7582. But an income nevertheless?—It is a receipt of that year.

7583. *Mr. Grant Duff.*] In all large accounts are there not every year exceptional receipts and exceptional expenditure?—Yes, I fancy there are in England; for instance, there was the China repayment which the other day came in as income for that year.

7584. *Mr. Fawcett.*] But it makes a difference, does it not, as to the appropriation of these exceptional receipts whether a country is in the financial position of England in which borrowing is extremely exceptional, or whether a country is in the financial position of India in which borrowing may be considered to be its normal condition?—I do not think that you can quite fairly say that. The debt of India cannot compare in amount with the debt of England; it is not much more than two years purchase of the revenue.

7585. *Mr. Grant Duff.*] You have never given special attention to accounts?—No; that has never been my duty at all; all the time I was in India I had nothing to do with accounts.

7586. You came here because you knew about the receipts from law and justice, and certain other heads of receipt, not because you had a special knowledge of accounts?—No; I know nothing about accounts.

7587. *Mr. Fawcett.*] You were summoned to give us evidence as to the revenue derived from the sources; who is there (I simply want the information, and I do not wish to imply that it is your duty) whose duty it would be to point out the proper appropriation of this money, and whether revenue ought to be devoted to income?—I think for that you must get the Financial Minister of India, Sir Richard Temple and his department.

7588. There was another item, which was referred to in the sources of revenue, namely 70,000 *l.* for process?—Yes.

7589. That represents a charge upon the suitors, in addition to the 7½ per cent., does it not?—It is partly made up from suitors, but not suitors in a civil case; it is as much derived from the administration of the criminal law. Complaints are made which necessitates a hearing, and the production of witnesses, and they are summoned, as it were; it is by no means, I think, influential as a charge which falls upon the suitors in civil cases.

0.59.

7590. But a portion of it does?—Yes, a portion of it does.

7591. Whatever portion does fall on suitors in a civil case represents an additional charge levied upon the suitors themselves of 7½ per cent.?—It is an additional charge. But you should kindly bear in mind, that when an action is brought by one man against another, it is tried very near his own home, originally, and the charge then for the process is very small, because the witnesses are all within hail; when there is an appeal made, and it goes up to the district court, it is not always that the witnesses are called; perhaps they desire that one or two should be called; perhaps the parties wish the case to be tried entirely from the papers before the court, and both sides may say "We do not want witnesses called at all; we will go on the statements made in the court below." Therefore I do not think that any very large part of the process receipts falls on the civil suitors; but still it is an addition.

7592. Therefore an answer which you previously gave in reply to an honourable Member, that the 7½ per cent. stamp duty covered all the court fees, requires, according to the answer which you have just given, some modification?—No; it covers all the court fees; that is to say, what goes to Government; but this, though paid into the Government, they pay out again, as it were, to those who serve the process. In olden times this never appeared in the accounts at all; there was a fund kept in the court, and they employed men to serve process; it was called the Ameen fund on the Bombay side, and the Talabana fund on the Bengal side, and it never appeared on the Government accounts at all. It is true that it is a charge upon the suitors, but not a part of the court fees.

7593. Not a court fee nominally in India, but still it is a court charge?—It is an expense attendant upon the suit, I quite admit that.

7594. I mean that the 7½ per cent. does not cover all that is levied from the suitors for court expenses, or court charges; this is an additional charge levied upon them?—This is an additional charge levied upon them certainly.

7595. *Mr. Beach.*] I think you said that many of the convicts were employed in various trades?—Hardly in trades; they are employed in various manufactures.

7596. In skilled labour?—They are not employed in skilled labour, or else the profits would be much greater; they are men who have to be taught in gaol.

7597. Is there a trade instructor?—No, I think not; there is a foreman, as it were, but not for each trade.

7598. It might be a thing worth considering whether it would not be worth while to have a trade instructor?—I think there is always some person who can instruct them. What I meant was, that each person is not asked, "What can you do, or what do you wish to do, and we will teach you that."

7599. But by good conduct they have the power of gaining the opportunity of being employed in this kind of labour, which would be less irksome than mere manual labour?—Yes, by good conduct, certainly. There are various kinds of labour, some which is remunerative, and some which is not. For instance, we may say that shot drill, and anything of that kind, is not remunerative; and if a man behaves well he is let

off that sort of labour, and is put upon the more remunerative labour.

7600. Have they the power of obtaining a remission of the sentence by good conduct?—In some gaols, they have got a good-mark system. There has been a great discussion on that point in India, whether a man should gain a remission of his sentence by good conduct. I think in the Punjab they do allow good-conduct marks to go towards remission of sentence, and in Bengal they have what is called intermediate imprisonment.

7601. Is there any jealousy of the interference of convict labour with free labour?—Yes, I think there is of convict manufactures. I have always, for instance, had considerable doubts about the press of the Alipore gaol. When I went over the Alipore gaol myself, the only objection that I could find to it was that I could not see where the hard labour was; the work of the press is not very hard labour. But since that time Dr. Mouatt has amended that a good deal; there are now jute mills and oil-pressing machines, which involve very severe labour.

7602. Have they a treadmill in Calcutta?—Yes; there ought to be a treadmill in every gaol, I think, in India. There was one in the common gaol of Bombay; and, one in the common gaol of Calcutta; but I think that a treadmill is very essential.

7603. It may be made productive, to a certain extent, for grinding the corn?—Yes. I should say that the general fault of Indian gaols, in some of the best gaols, is that the object of enforcing really hard labour has been a little sacrificed to the out-turn of profit. I think that is the case in some of the best gaols, that they, perhaps, have not made the gaols sufficiently deterrent because they wished to make them sufficiently profitable.

7604. Very similar to the state of things in England a little time ago?—Yes.

7605. Sir T. Bazley.] You spoke of manufacturing labour being employed in gaols; of what do the manufactures consist?—Chiefly, I think, weaving coarse cloths. There are various kinds; in Calcutta they have jute mills, and make what are called gunny bags very largely.

7606. Is that employment productive?—It is very productive.

7607. And returns income to the prison?—Yes, the jute mills are very productive; gunny bags are an article in immense demand.

7608. The jute is bought in the public market, and the manufacture sold in the public market, and the difference put to the credit of the gaol?—Yes. Then they make towels in some gaols, and they make carpets in some.

7609. And do they render Government service in any way?—Some of them perform menial offices in gaols, which saves the Government something, and in some gaols they have introduced a system which I like myself, they make them warders; it is rather like putting one offender to take care of another, but still they save a good deal of money by it.

7610. In the Alipore gaol of which you have spoken, there is a printing press?—Yes.

7611. And has it not been alleged that the charges made to Government for printing public forms have been so excessive, that the private trade has been greatly aggrieved, and would have done the same work at very much less cost?—I do not know that as a fact, but I was only in Calcutta twice. I cannot help imagining that it

must cause some dissatisfaction to the private presses.

7612. But when excessive prices are charged to the Government, and an apparent profit is made, is it not a fallacious system?—Yes, if it is so.

7613. And it is desirable that such a system should be corrected?—But I do not see why the Government should not go into the cheapest market.

7614. But upon what principle generally is the profit upon gaol labour ascertained. You give a specific instance of the right method being employed in the case of the jute, where the raw material is bought, and the manufactured product is sold in the open market. How is it in regard to the other cases?—I think in regard to all manufactures it is the same; and then with regard to labour they take it at the market rate; it is a nominal sum; they put down so much for labour.

7615. That is rather an estimate than a result?—Of course they do not pay the money; but they say that there is so much; they may lend a couple of hundred convicts to the Public Works Department; or in some cases they have done this, they have built a gaol with convict labour; there the Government is saved the free labour that would have been needed.

7616. That would be productive labour in that case?—Yes; but as a rule convict labour is of course very inferior to free labour, and at one time engineers said that they would rather not have convict labour at all.

7617. Does not the system require some amendment in the respect which I have indicated, because it is delusive to the public?—I think that if the Government can build a gaol with convict labour, it is a very good thing; they save the cost of free labour, though probably the free labour would have done it in a shorter space of time.

7618. In that case they show results, but in all cases you do not show results?—I think so; an engineer would say, "I prefer free labour to convict labour, but if the market is rather overstocked, and I cannot get free labour, I am very glad to get convict labour, though I should prefer free labour."

7619. Do the prisoners come out from gaol, do you think, imbued with better principles than they enter it with, and do they acquire the habits of industry?—No, I cannot say that I think they do.

7620. Mr. Lyttelton.] I suppose in all cases the gaols are enabled to undersell the local trade?—Yes, I should think so; I should think that their manufactures would undersell the manufactures of the place.

7621. Is it often the case that they go on side by side?—No, I think that the manufactures of the gaol are not of the same kind as those that are carried on in the place at all; they meet another want.

7622. Is care taken that such should be the case?—I will not say that care is taken; I think it is an object that they have rather in view.

7623. Are there inspectors of prisons, as there are in England, whose duty it would be to certify various sorts of labour as hard labour, or as labour of another class?—Every gaol has a superintendent, who has been of late years, and always will be now, a medical officer. Then each Government or administration has an inspector-general of prisons, who periodically visits all the gaols,

gaols, sees what points he thinks are wrong, and puts them right.

7624. And is it his duty to certify the labour as being up to the mark required?—No, I do not think he does that; there is no certification of that sort.

7625. With regard to the large sum returned under the head of fines, that represents the gross receipt from fines, I suppose?—Yes.

7626. Are there any officers in India that are paid out of those funds, as magistrates' clerks in England are paid?—No, the system is one of revenue on one side, and expenditure on the other chiefly.

7627. There is no officer that has an interest in the amount of fines levied?—No.

7628. Mr. *Candlish*.] You stated the gross income under the head of law and justice as 801,954 l. ?—That is the gross income, exclusive of stamps, which is an item which I said the other day was I thought about 1,400,000 l.

7629. In speaking of the 160,000 l., registration fund and fees, and the 135,000 l. as having been saved from previous years, you thought they were separate sums?—I confess I did, and I cannot help thinking so still. The only thing that staggers me is that certainly it is put down as "registration fund."

7630. I want to direct your attention to the fact, that if both those items were put in here, it would make that total of 801,000 l., upwards of 900,000 l. ?—If the registration fund is exclusive of that 135,000 l., then it would.

7631. Does the fact that your total would be made up to upwards of 900,000 l., not lead you to infer that the 135,000 l. must be included in the 160,000 l. ?—I can only imagine that if it includes that, they have only given the profit of the annual income; I will see to that point.

7632. From Bombay you have no receipts at all from gaol labour?—There is none down in this account.

7633. Then the 801,000 l. must be incorrect as a total of receipt?—No, it is in this way. These sums put down are what have actually reached the Treasury. Now it is very possible that the Bombay sum has not reached the Treasury during that year, but it will reach it next year. And so in the same manner with some of these other sums. Take the 104,000 l. for Bengal, for instance; that may include an arrear of last year.

7634. You are not aware of the state of the accounts in the previous year, 1868?—I have not got them here, but it is always so: you cannot, within the period from the 30th of April in one year to the 30th of April in another, get the total income up to the very date.

7635. But it would appear to me inevitable that you should get a year's income, if a period of a year was taken?—Taking the 30th of April from year to year, supposing a great deal of income falls due in the last 15 days of the year, for instance, you cannot get it in the account.

7636. But, I apprehend, we know in England what our income is within the year, and you have the same power in India, have you not?—I dare say that they do know it; indeed I have no doubt that they do know it; or, at all events, they can estimate it.

7637. Then the accounts are incorrect?—No, the accounts are not incorrect; but they only put down the actual receipt, what they actually get in without any estimate for what they might receive.

0.59.

7638. From the fact that there is no receipt put in from the Bombay gaol, you infer, do you not, that there was no receipt from that labour?—No, I do not infer that.

7639. Would it not follow then, that the accounts are incorrect?—No; it may be an incorrect system, but these are sums actually received.

7640. The accounts must be incorrect in so far as the Bombay sums are omitted, must they not?—I am quite certain that all these sums put down here were not actually received during this year. Some of them were arrears of the year before.

7641. Is not that a cash account in your hand?—It is a statement of the items actually brought to account in Calcutta.

7642. Then there is no estimate at all there?—No, there are actual receipts.

7643. You are of opinion that there were receipts in Bombay, and they are not in that account?—And, in the same way, when I see 104,000 l. down to Bengal for proceeds of gaol labour, I do not suppose it was entirely obtained in that particular year; I dare say 10,000 l. is arrears of the former year.

7644. Then that is a further incorrectness in the account; besides, the omission of something received there is an admission of something not received?—No; I draw this distinction, that these are sums brought actually to account in Calcutta; it is only a matter of account.

7645. Ought not all receipts of every kind to be accounted for at Calcutta?—Yes; they ought to be.

7646. And in the absence of an account of some receipts the Calcutta publication must be incorrect?—Yes; but if you will allow me to illustrate it, in these actual receipts there is nothing down for the Central Provinces, except the gross sum; they have got a gross sum down, but they have not the items; they have not that information from the Central Provinces; and so it may be that by the 30th of April they had not the account from Bombay of what has been received from gaol labour.

7647. If I did not misunderstand you, you stated that in all probability the receipts from the labour of the Bombay prisons had been deducted from the actual cost, and that you had the cost of the prisons before you, less the receipt?—No; the Chairman suggested whether it might be so, and I said, "Yes; it might be that the one has put down nothing, because the cost of the gaol is much greater than the proceeds of the manufacture of goods, and therefore nothing is put down; but it is only subtracted from expenditure."

7648. If this 801,000 l. does not include anything whatever of receipts from labour in the Bombay Presidency, to the extent to which it omits, then it must be incorrect, must it not?—Of course, I will admit that it is not exactly complete; but I think that it must always happen that you cannot get the whole year's money in during the whole year; you must depend upon an estimate.

7649. But you must account for what you do get in?—Yes.

7650. And that is not accounted for from Bombay?—It may come to account next year.

7651. Then the 2,903,000 l. of expenditure for Law and Justice in India, may be incorrect in the same

Sir H. L. Anderson,
K.C.S.I.

20 June
1871.

Sir H. L.
Anderson,
K.C.S.I.

20 June
1871.

same way?—No; because those are generally fixed charges as it were.

7652. But if the proceeds of the labour in Bombay be deducted from the cost of the Bombay prisons, and the balance only shown of this sum of 2,903,000 L., it must be incorrect?—No; it would still be right if that were the case. If it is so (which I am not certain that it is) it is a bad way of accounting. Of course the right way of accounting is to bring in the whole revenue on the one side and the whole expenditure on the other.

7653. And you would do that?—I would do it; that is what I particularly want done.

7654. You say that 413 of the prisoners in the Alipore Gaol realise 237,000 rupees?—Yes.

7655. That is really about 50 L. per man per annum?—Yes.

7656. That is a pound a week approximately, whilst he has been costing 5 L. 6 s. per annum gross?—That is thrown over the whole Presidency.

7657. And 3 L. 12 s. per annum is his net cost, while he has been working for 50 L.?—That is thrown over the whole of the gaols of Bengal.

7658. But is the fact as I put it?—Yes.

7659. You have very imperfect accounts, I think, from Madras too, you told us?—Yes.

7660. That will be another element of inaccuracy therefore?—I do not say that; all I say is that the report is defective from Madras. They say that the gross cost per prisoner is 70 rupees; they do not tell me exactly what the net cost is.

7661. Do they tell you what the proceeds of their prison labour are?—No, they do not in the annual report.

7662. Then that is another element of error in the 801,000 L.?—No; but in the report which I have got from Madras, they have not told me what the amount of their labour was; that has nothing to do with the accounts at all; they make an annual report, and I have myself nothing to do with the accounts at all.

7663. If there be an omission of labour from Bombay and from Madras, there are two elements of inaccuracy, are there not?—The return from Madras is 2,911 L. profits of labour, the proceeds of gaol manufacture sold. I mean the profit, taking first the cost of the raw material, and then the cost of the manufactured goods, and subtracting the one from the other.

7664. But it is not profit, if you are keeping the men who do the work, at the same time?—No; of course, I know that the cost of the gaols is very much more than the proceeds of the gaol manufactures.

7665. Your calculation is that the Bengal prisoners cost 53 rupees per annum, the Madras 70 rupees per annum, and the Bombay 102 rupees per annum?—Yes.

7666. *Chairman.*] Do you think that it would clear up this question of the amount of the receipts for the registration fees, if I were to call attention to the fact that in the account of expenditure there are several items for the different Presidencies for registration expenses, amounting to about 107,000 L. for that year?—I say that I think that that is the income of the year apart from the accumulations; only unfortunately I have not got the book here which would show me that.

7667. And you think that the accumulation would appear under some other head?—Yes; I think I can say, on consideration, that the

160,000 L. are the receipts for the year from registration, and have nothing to do with the accumulation of 13½ lacs; I think that is taken into the general account long ago.

7668. For one or two governments it is not mentioned at all; then if that were so, yielding a profit of 25,000 L., the gross income of registration would be something above 132,000 L. in the year?—Yes, this year it must be more; it has only been an average since the Registration Act was passed. Their calculation is that the excess of revenue over expenditure has been 25,000 L., but this year it is more.

7669. That would bring it up to 132,000 L.; there would still be a deficiency, or sum unaccounted for, of 28,000 L. or 30,000 L.?—The receipts may have been larger this particular year, and that may account for the fact of the Government having determined by this new law to reduce it; I believe the gross income from registration of assurances to be 160,000 L. in that year. If it is as the honourable Member for Brighton suggests, that in that 160,000 L. there is an item for accumulation of 135,000 L., then the Government have only put down that item and the profit; but I do not think that they have done that. It is odd enough that the two sums of 135,000 L. tally. If there is 160,000 L., out of which 25,000 L. is the net amount, there must be another 135,000 L. received that year besides accumulations; and therefore you see we come to the same thing.

7670. We want to clear up whether the accounts have been kept in one way or another; in this account there is apparent no expenditure; the expenditure on the establishment for registration appears on the expenditure side of the account?—I have not the slightest doubt that what I originally said is right, and it is a mere matter of stating the account. If the 25,000 L. is down as the net profit and the gross is 160,000 L., there must be another 135,000 L.

7671. *Mr. Fawcett.*] But the difference is this: if 160,000 L. is put down as a gross receipt it represents a gross receipt?—That is what I say it is; I was staggered for the moment by the word "fund."

7672. But what you originally replied was that that 160,000 L. was composed of two distinct elements of the 25,000 L. and the 135,000 L.; you said that it might be so; but it is all the difference in the world whether that 160,000 L. is gross receipt or whether it is composed of two elements, which you said it might be composed of, namely, 25,000 L. net receipts and 135,000 L. obtained from the devotion to income of an exceptional receipt, namely, accumulations; why I cross-examined you at some length upon the point is this, that if it is 160,000 L. of gross receipt it is one thing; if on the other hand, Government made up the 160,000 L. by appropriating 135,000 L. from the accumulation of these funds, would not that be a most improper appropriation?—But if the expenditure is so much the 25,000 L. is the profit; it does not very much matter.

7673. *Chairman.*] It is important that we should know whether the account returned is on the footing of the whole of the receipts for registration being put on one side and the account of whole of the expenditure on the other, and whether that has been done in successive years, or only in this year; because, if it has been done in successive years there can be no great income to bring to account. We want to know, as a matter of

of fact, as the expenditure for registration does appear in the accounts for this year, is the gross receipt for registration on the other side of the account. Will you investigate that point?—Yes.

7674. Sir T. Bazley.] Are you aware, that there was a Committee of inquiry respecting that gaol at Alipore in 1870?—I was not there in 1870; I was myself on the Gaol Commission in 1864.

7675. But in 1870 a Committee sat to inquire into the productiveness of the gaol, and are you cognisant of the fact that it was then ascertained that the printer of the "Englishman" paper complained that the charges made in the gaol were 30 per cent. in excess of the charges that he made in his private business?—No, I have received no report of that yet.

7676. Then you are not aware whether any remedy has been applied to that system, which would appear to be one of great delusion as to profits arising from the printing department in the gaol?—No, I am not aware.

7677. Then it was also proved, I think, that Mr. Jones was compensated for his assumed good management of the printing department by a gift from Government. Are you not aware of that fact?—I am aware of that; at least I think Mr. Dobson got a per-centage upon the out-turn of labour.

7678. All that is very delusive as to the realisation of profit by exorbitant charges that were beyond the market rates?—Well, I do not know that they were beyond the market rates. I have not seen the report of the Committee, but I have no doubt that the independent presses of Calcutta would lower their rates a good deal in order to obtain the custom of the Government.

7679. But I think it is in evidence that there appears to be some collusion between Mr. Jones and a Mr. Wyman, the latter having had some Government work to do for which he was paid the same rate that Mr. Jones obtained on the part of the gaol?—I have not received that report, but I can quite say this: that I always thought that the only defect in the Alipore Gaol was, that they looked too much to the out-turn of labour, and that the superintendent got a per-centage upon that.

7680. That charges were made, in all probability, which were not founded upon fair and equitable results?—I cannot say that. I have not seen the report of this Committee to which you allude.

7681. But you are probably impressed with the importance of correcting such delusive arrangements as appear to have existed?—Of course, if it were so. I am of opinion, altogether, in the Alipore Gaol that they think too much of the out-turn, and that Mr. Jones, who is superintendent of the press, has an interest in getting as large an out-turn as possible, and I think that they may therefore have sacrificed other parts of the gaol government to that part.

7682. Compensations by commission of course are always the largest where the charges made are the highest?—You are now alluding to the press, I presume, because the other manufacturers go generally into the open market themselves; but I think that, if the press has charged the Government higher than fair market rates, there is some degree of delusion in the matter then.

7683. I think the principle is correct which you have alluded to, where the jute bags are 0.59.

dealt with upon the principle of charging the cost of the material and then selling the manufactured product in the open market, and taking the difference?—Yes.

7684. Mr. Grant Duff.] Now we will come to the Post Office; what was the amount of gross receipts for the Post Office in the last year, 1869-70?—£. 711,698.

7685. Will you very shortly explain to us how that was made up?—The postage on letters and newspapers is 90,738*l.*; on Bangby parcels it is 24,818*l.*

7686. Will you explain what they are?—They are packets too large to send by post, and they are parcels, in fact, which are sent by a sort of Parcels Delivery. Then, Service Postage, 270,499*l.* Service postage means the Government letters of the various departments. Sale of Postage Stamps is 291,851*l.* Cash Sale of Service Labels is 9,877*l.* In regard to service labels they have two systems; there are certain privileged offices the heads of which can frank, as it were, and a separate account is kept of that; and there are other offices that are not privileged, and in which those who send letters upon the Government service buy service labels and affix them to the letters, and a careful account is kept of that and they are reimbursed afterwards. Then the next head is the Nagpore and Jubbalpore Passenger Service, 8,620*l.* Now a railway goes the whole way across, but before there was a break, and they sent the mail in mail carts, which also carried passengers, and that is the meaning of that item. Then there are mail carts and parcel vans, 7,212*l.*

7687. Mr. Candlish.] What is that mail cart?—There are parts of India where there is no railway, and where the post is not carried by runners but by carts. Then there is Miscellaneous, 7,968*l.*; and Contributions from Native Chiefs, 115*l.* That makes up the 711,698*l.*

7688. Mr. Grant Duff.] Now will you compare the return for the last year which you have with the return for the year in which the Anna Post was first introduced, that is to say, the year 1854-55?—In 1868-69 the letters were 76,867,918; the newspapers were 6,165,039; the parcels were 764,911; and the books and patterns were 736,710; the total was 84,534,578. Now the letters and newspapers together were 83 millions for that year, and the year in which the anna postage was introduced the covers were 28 millions and odd; that is to say, it increased from 28 millions to 83 millions.

7689. A letter now goes from the extreme south to the extreme north of India; say from Cape Comorin to Peshawur, for an anna, does it not?—For half an anna, if it is small enough; it used to be a quarter tolah; they increased it in 1868. The rates formerly were half an anna for a quarter tolah, and one anna for a half tolah, and two annas for the whole tolah; they have now made it half an anna for the half tolah, one anna for one tolah, and two annas for two tolahs.

7690. Have you ever heard the suggestion made that it would be desirable slightly to increase the rate upon long distances, and to put on a very, very small rate upon correspondence passing within, say, 20 miles?—I have heard of such a suggestion, but I do not at all agree in it; I think that it violates the spirit of the postage system.

7691. You do not think that the present system is unduly favourable to Government correspondence and to European correspondence, as compared

Sir H. L. Anderson,
K.C.S.I.

20 June
1871.

Sir H. L.
Anderson,
K.C.B.I.

20 June
1871.

pared with the correspondence of the natives?—No, I do not think it is.

7692. You have heard that said, perhaps?—I have heard it said that when you send a letter so far, you ought to charge more for it; that rather applies to the Europeans when the letter goes from one part of India to another.

7693. But have you ever heard it stated as rather a native grievance that the correspondence of the Europeans, which is likely to go over a greater number of miles than that of the natives, should pay so little, and that their correspondence, which is very often confined to a narrow circle, is charged just as high?—No, I have never heard that, but I had nothing to do with the Post Office while I was in India.

7694. Will you tell the Committee what are the present relations of the India Office with the Peninsular and Oriental Company and with the Imperial Post Office?—With the Peninsular and Oriental Company a contract was made in the end of the year 1867, by which Government bound themselves to pay 400,000 £. to the Peninsular and Oriental Company, but also if the dividend of the Peninsular and Oriental Company did not reach 6 per cent., the Governments (that is, the Indian and English Governments) were to pay the difference and make up the dividend to 6 per cent. That was thought so exceedingly inconvenient that in August of last year a new contract was entered into by which the Government pays the Peninsular and Oriental Company 450,000 £., but is not bound to make up the dividend; and I should say that the old contract rather imposed upon the two Governments a charge of 500,000 £. instead of 400,000 £.; but they now have made it 450,000 £., and they have nothing to do with the dividend.

7695. How long will that engagement last?—Till 1880.

7696. It cannot be revised or altered till 1880?—No.

7697. What is the service which they perform?—They convey the mails from England to Bombay, and from Bombay to England.

7698. Once a week?—Yes.

7699. Mr. *Candlish*.] Is that only for their sea service?—The Peninsular and Oriental Company only do the sea service, of course. They are paid 450,000 £., that is all that they are paid, and that is to convey the mails to Bombay.

7700. Do they pay for conveying them through France?—No, the French Government got that. The postage was fixed at 13 *d.* of which 7 *d.* went for the sea postage, 4 *d.* to France, and the rest to the two Governments.

7701. Mr. *Grant Duff*.] Will you explain our other relations with the Imperial Post Office?—Of the 400,000 £. the Indian Government was bound to pay 117,000 £., and they received an estimated postage of 62,000 £.; and their loss was 54,000 £.

7702. To whom did they pay this sum?—They I presume paid it to the British Government, which paid the Peninsular and Oriental Company. Their share was to be 117,000 £., and they were to receive 62,000 £., so that their loss was about 54,000 £. on the contract; that was the estimated loss to the Government on the Indian Post Office. The total subsidy was 400,000 £. (I am talking of the old one, because the other is only a slight modification of it). Then they deducted for Australia 50,633 £. Then they added for incidental expenses 20,645 £. Therefore the

cost for which provision was to be made amounted to 370,012 £. Towards that the Imperial Government was to contribute 182,747 £., and the estimated collection of sea postage was 85,815 £., so that the total of their share of the loss was to be 96,932 £.

7703. Mr. *Candlish*.] To what date does this apply?—The contract concluded at the end of 1867, which went on till last year up to the time of the new contract. The new contract was only 50,000 £. more, and they divided that in a way which I will show you afterwards. Then the Indian Government had to pay 117,053 £., and deducting the estimated collection of sea postage, which was 62,782 £., the total loss was 54,271 £. to the Indian Government. Then Ceylon was to contribute 8,386 £., and to take 3,283 £. postage, leaving 6,002 £. as their share of the loss. The Mauritius was to contribute 6,519 £., and the estimated postage was 1,308 £., therefore their loss was 5,211 £.

7704. Mr. *Cave*.] The Mauritius mails go by the French boats, the *Messagéries*, do they not?—No, I think not. The *Messagéries* did at one time take passengers I think, but in competition with the Peninsular and Oriental Company. Then China was to pay 55,278 £., and the collection of the postage was 22,065 £., making a total loss to them of 33,203 £. Then it was said at the time that the Imperial Government well knew that they would have to pay a good deal for China, that China would not be able to pay its share. That I need not go into. The total loss to the Imperial Government was 131,000 £., to the Indian Government 54,000 £., and to the Colonies, Ceylon, Mauritius and Hong Kong, it might be 70,000 £.; and it was believed that the Imperial Government might have to bear some part of the loss both of China and the Colonies. Then in 1870, in consequence as I have said of its being found that the fact that we were bound to make up the dividend of the Peninsular and Oriental Company occasioned great loss, the Post Office, and I fancy the Treasury (the India Council was not consulted) made a new contract, and they agreed to pay 450,000 £.; and in consideration of that additional 50,000 £. our contribution was raised from 117,000 £. to 132,500 £.; therefore our total loss was raised to 69,818 £.

7705. I do not quite understand the account on page 12. I see that the Post Office receipts (called the net receipts here, but really the gross receipts) are 711,698 £., and the charges for collection, 649,934 £., and then the net receipts paid into the Treasuries, 61,764 £. But in the former account at page 6, the gross receipts were given at 711,698 £. (which correspond with the sum given in page 12), and the total expenditure at 688,483 £., making the net receipts 23,215 £.?—The gross receipts are put down at 711,698 £., and the gross charges in India are 649,934 £.

7706. £. 688,483 I see as the total charges against income, and the net receipts on page 7 amount to 23,215 £., which is the balance between 688,000 £. odd, and 711,000 £. odd?—Yes.

7707. But then in page 12 the net receipts are 61,764 £.; but I imagine that 23,000 £. is all that really finds its way eventually into the Treasury?—Yes, that is so, I think.

7708. So that this column, number one on page 12, gives an incorrect impression, does it not?—These are the sums that actually find their way into the Indian Treasuries.

7709. Then, after they have found their way into

Sir H. L.
Anderson,
K.C.S.I.
20 June
1871.

into the Indian Treasuries, there is still an expenditure for English charges?—Yes, about 40,000 £, I think, is repaid.

7710. But is it shown in the accounts what charge has to be paid to England out of this 61,764 £?—£. 38,549 are the English charges.

7711. As to inland postage, the distant letters, I suppose, do not pay for the carriage, do they?—No; I ought to mention that we only get an income at all from the Post Office by taking in the Service letters; they are charged for as if they were paid letters, as it were. If we did not take that into consideration, there is a deficit of about 160,000 £. If you charge those letters, it is about 120,000 £ profit; but there being a uniform rate throughout India, we must lose upon the longer distances.

7712. Are the short distance letters very much more numerous than the long ones?—I should say that the greater part were between the large commercial centres, whether small or large; I do not think there is very much between the different small towns.

7713. But the principal revenue comes from letters sent between large towns?—Yes.

7714. Are those sent by natives or by Europeans chiefly?—Well, I should say in the large commercial towns, I think by natives; I do not mean the Presidencies, but I mean the other commercial centres.

7715. And I suppose that the Presidencies would vary; in Bombay for instance, would there be more native letters between great towns than in the other Presidencies?—No, I should think more between some of the towns in Bengal and the North West; Bombay has, perhaps, only one great centre, which is Bombay itself. There are three other large towns, Poonah, Ahmedabad, and Surat; the rest are small.

7716. Then you would not give any weight to the complaint that the Europeans are favoured at the expense of the natives with regard to letters?—I do not think they are; I never heard any complaint all the time I was in India, but, as I said before, I was not in India in a position to hear such complaints.

7717. The mails are carried by the railways, of course, as far as the railways go?—Yes; I have a return of how they are carried; of postal lines 4,433 miles by railway, by mail-cart, horse dawk, and camel dawk, 5,333 miles; runners and boats, 35,498 miles. Those boats are on the Irrawaddy, the Indus, and other rivers.

7718. On the Indus they go by the Steam Flotilla, I suppose?—Yes; and then there is the sea, 5,613 miles.

7719. Does the postman get on board the steamers and go with the mails to the end?—Not the runners; they are put in charge of some mail agent on board. The letters are conveyed in certain parts of India by boats, and in other parts by runners.

7720. But are those that are carried by boats put under the account of "Runners"?—No; in the annual report from India runners and boats are joined together, that is all.

7721. Was there a contract made with the railway companies to carry the letters?—Yes, they are bound to carry them free; but we have now introduced frontier sorting, and they have to provide the sorting carriages, and for that (they call it haulage) they are paid. There has been a discussion as to what is to be the sum; some railways propose that they shall be paid a lump sum, and others propose that they shall be paid a 0.59.

mileage; but the question has not been settled yet; they believe it will be about 2 annas a mile.

7722. Do you see any prospect of reducing the charge upon inland postage?—No, I do not; some time ago the Government of India threatened to increase it, and our office remonstrated.

7723. With regard to the sea-postage, is the loss greater upon the letters that go by the heavy mails that go round, or by those that are sent across Europe?—I do not know how the loss is at all appropriated. The Peninsular and Oriental Company makes no distinction; it says: "We take so much, and we will convey it both by Southampton and from Marseilles."

7724. But the letters go now from Brindisi, many of them?—Yes; and they have reduced the postage 1 d. in consequence.

7725. Do any go through the Suez Canal?—No, not yet; it has been calculated very carefully, and they think that we should lose time by going through the Suez Canal, even putting aside accidents.

7726. I suppose you would save in expense?—It depends entirely upon what charge the Suez Canal Company would make for the transit through the canal; it has never been even mooted yet. I have seen one report in which going through the canal was rather deprecated; they thought that we should lose time.

7727. None of the Peninsular and Oriental steamers go through the canal?—None.

7728. Sir C. Wingfield.] Has it not been said, and is there not an impression prevalent in India which has been referred to in the press, that India suffers from the mail service being connected with the mail service of China and the Australian Colonies, in having to pay more for her letters?—No, the Imperial Government pay whatever China cannot pay; the only complaint I have met with is this: the Peninsular and Oriental Company send steamers from Ceylon to Calcutta, and the Indian Government say, "We do not want them for our mails;" but the Peninsular and Oriental Company says: "We will only make the contract on the condition that a certain sum is paid for that line," which line we do not want.

7729. "We will only take the contract for the Indian mails on that condition"?—Yes; they send those steamers for the sake of passengers, and they are determined to get a sum of money for that line; and the Indian Government remonstrate and say, "We do not want the line;" the Government lose about 12,000 £ a year by this charge.

7730. From the maintenance of that line from Ceylon to Calcutta, which the Indian Government has protested against very strongly, and which is only kept up for the use of passengers, because the mails now all go by Bombay?—Yes.

7731. Therefore, India has to pay 12,000 £ for the conveyance of the passenger traffic?—India has certainly to pay 12,000 £ for what it does not want, viz., the line from Ceylon to Calcutta, and it has protested against it; we made three appeals to the Treasury on the subject.

7732. But when the Peninsular and Oriental Company said that they would not take the contract unless they got this payment for the line between Ceylon and Calcutta, I imagine that they would have given way if the Treasury had insisted upon it?—No; tenders were invited, and the

Sir H. L.
Anderson
K.C.S.I.

1871.

the tenders of the Peninsular and Oriental Company were the only tenders received.

7733. At that time, when the contract was renewed three years ago, the first intention of the Government was to give the contract to the lowest bidder, and I think it was in contemplation to give it to a French company?—No, the Peninsular and Oriental Company's were the only tenders; I think Austrian Lloyd's tendered for the parts between Trieste and Alexandria, but that came to nothing.

7734. Then you think that a better contract could not have been made?—I think there was one great mistake in the contract; it was binding themselves to make up the 6 per cent.; that they have got out of now.

7735. But there being no other tender much better, that was not to be helped?—It could not be done; we were quite in their hands.

7736. The overland postage to India has been very much increased of late years?—It was increased on that contract from 9d. to 1s. 1d., that is to say, 4d.

7737. And there was a further increase by Brindisi?—No, there was a decrease, making it 1d. less; it is 1s. now.

7738. What rendered the increase necessary on that contract?—The very large loss that was sustained by the Imperial and the Indian Governments. I ought to mention that the Government of India remonstrated very strongly against the increase of postage.

7739. Has the increase of the rate led to a diminution of the loss on the postage?—No, I do not think it has. Of course the loss would have been very much greater, if we had not increased the postage.

7740. But then it has also had an effect on the number of letters I should think?—Yes, it has.

7741. In fact, I saw it stated by the Postmaster General in India, about a year ago, that it is nothing but this increase of the postage that has kept back an immense development of postal communication; are you aware of that?—He did say so.

7742. In consequence of the weekly mails by Bombay, and the operation of the Great Indian Peninsula Railway, the increase in postage would have been considerable?—Yes, it stands to reason that it would; that the department would have been greatly developed if it had not been for this additional weight thrown upon it of the 4d.

7743. Mr. Dickinson.] Have there been fewer letters sent since the rise of the postage?—There must have been fewer sent from England; I have no doubt it is so; people send now two letters under one cover; in that way loss occurs.

7744. Are there any Post Office Returns showing the number of letters that were sent before and have been sent since this change; have you the means of knowing how many post letters and parcels went before and after the change in the postage?—I do not think so.

7745. Would there be any difficulty in ascertaining the number?—It could be ascertained no doubt; it is not one of the returns sent to us; the returns sent to us are chiefly of the Indian Post Office, but I have no doubt it could be obtained.

7746. How is the postage arranged between our own territory and native states; for instance, does a letter go from Bombay to Indore for the same charge as from Bombay to Calcutta?—Yes, that has been arranged with Holkar.

7747. Can you tell us the terms on which the postage is arranged between our own and native states?—The British Government pays all the expenses and takes all the postage. If there be a deficiency the native government makes it up.

7748. Some of the large centres of commerce are in native states?—Yes.

7749. You alluded to a payment of 117 l. by native states; I suppose that that is in respect of these letters which I am now referring to?—Yes, those payments are to make up deficiencies.

7750. You do not know whether the result of the arrangement with the native states is, that they receive, or pay more?—The native states only makes up deficiencies.

7751. Mr. Beach.] Does the general revenue seem to be an increasing one for the Post Office?—Yes, I think it is; I ought to mention that in the last year it decreased.

7752. Was not that in consequence of a very considerable reduction in the charges last year, of which we have not got the returns yet?—Yes; in 1870-71 they have again decreased the charges upon newspapers; it was 1 anna for 10 tolahs, and now they make it half an anna for 10 tolahs; this very last year, of which we have not got the accounts yet, these reductions that were made for the benefit of the public, will for a very short time made a decrease of revenue; but I have not the slightest doubt that there will be a very great increase eventually. I could tell you how the revenue has increased; in 1853-54, which was the year before the anna postage came in, it was 451,962 l., and this year, 1869-70, it was 681,601 l.

7753. Mr. Fowler.] Have you any statistics of the number of newspapers passing through the Indian Post Office?—Yes, I mentioned that there are 6,165,000.

7754. Mr. Candlish.] Do you know the amount of loss on the contract concluded in 1867; in addition to the 400,000 l. absolute sum?—I think it cost about 500,000 l.

7755. Was that paid by England and India?—Yes; we were bound you know to make up a certain sum, that was paid by the two.

7756. On what basis did you settle the liabilities?—We were called upon to pay certain sums for future adjustment on the basis of the original settlement; I believe that was the method.

7757. Do you know what examination of the Peninsular and Oriental Company's accounts took place?—I do not know of my own knowledge, but before the contract of 1867 was made, which was made after a consultation in which the Chancellor of the Exchequer, Mr. Ward Hunt, came down to the India Office, the Secretary of the Post Office, Mr. Tilley, Sir Stafford Northcote and Mr. Merivale also took part; it was agreed that Mr. Scudamore, of the Post Office, now the head of the Telegraph Department, should go over and examine the Peninsular and Oriental Company's books, and it was upon his report that the contract was made.

7758. And did he continue to examine them annually, as long as we continued liable to the 6 per cent.?—I believe so; I know he examined them before the contract was made, and I believe he did since.

7759. What were the proportions payable by England and payable by India, do you know?—I have mentioned that the net loss to England was 131,000 l.; that is the estimated loss.

7760. During what year?—It was the year 1867-68; that is what they estimated the loss would be.

7761. On

7761. On what basis did you fix the proportions payable by India, and payable by England?—The General Post Office made the calculation.

7762. Do you know the basis?—I have told you the basis; I have told you every item; England had to pay 182,000 *l.*, and to receive 85,000 *l.* That was made up in this way; for the line between England and Alexandria it was 70,603 *l.*; between Suez and Bombay (this is the English share) 47,053 *l.*

7763. But on what principle was it determined that we should pay these sums?—There was a certain sum to make up, 400,000 *l.* Then you said, "What is the fair proportion that each should pay?" and you said "Let the Imperial Treasury pay two-thirds of the charge between England and Alexandria," and it was computed that it would be 70,603 *l.*

7764. That is the result; but can you tell me the principle on which those sums were settled?—You had to make up a gross sum of 400,000 *l.*, and each contributed so much to the total.

7765. On what basis?—I think you will see if I read the items out. For the line between England and Alexandria the Imperial Treasury paid 70,000 *l.*, and the Indian Treasury paid about 37,000 *l.*

7766. On what basis was it determined that England had to pay two-thirds, and India one-third?—Because, in dividing the 400,000 *l.*, it was supposed that England had more interest on this side of Alexandria than it had on the other side; that is the only reason I know.

7767. I suppose you do not know the basis on which it was determined?—It was settled by the Post Office, but I think I have specified it.

7768. You give the figures, but you cannot tell why those figures were adopted?—If you will allow me to explain, between Suez and Bombay they exactly halved it, and each paid 47,000 *l.*, because the respective Governments had an equal interest in that line; between Galle and China 4,912 *l.* only was put down to India, and 15,000 *l.* to the Imperial Treasury, because the interest of England was so much greater in the China part.

7769. Then there was a loss in conveying letters to China, who pays that loss?—That we have nothing to do with, but the Imperial Treasury calculate that they will have to pay that loss.

7770. India has to pay nothing of that?—No.

7771. And you do not know if anything has been received from China on that account, I suppose?—No, I do not know. They calculate that there has been a loss of 33,000 *l.* In some of our correspondence with the Treasury, in which we pressed them to pay a part or the whole of the line between Ceylon and Calcutta, they said, "No, we have already had to pay a great share, and shall have to pay for China."

7772. When you speak of the gain on the postage to India, you include the sum that you pay on the loss of letters from England to India, and *vice versa*, I suppose?—There is no gain in the postage to India, unless you take the service letters into consideration, which, of course, is only a nominal gain.

7773. And you have done so in the account which you have handed in?—Yes.

7774. There is a gain in that account?—Yes.

7775. And the payment of 649,000 *l.* includes, I suppose, everything that you pay on account of the English and the Indian contracts?—No, it is only the inland postage.

0.59.

7776. Then there would be a loss on your whole transactions?—Yes.

7777. You do not know to what amount?—No.

7778. Mr. *Eastwick*.] Do the soldiers' letters and sepoy's letters go free in India?—They go free, but not officers' letters.

7779. Have you any idea about the proportion in bulk they bear to the rest of the letters?—I do not know, I never inquired, but I should say they are very slight; a native letter is generally very much lighter than an English letter is.

7780. They are very small letters, but I think that anyone who has seen the bag made up for a regiment can say that, when put together, they form a considerable mass?—I do not know that.

7781. Are there any native troops in China to whom letters are sent free from India?—I have no doubt that there were when our regiments were there; I do not think there are any native regiments there now.

7782. In that case, of course, India was gaining something, because it was sending those letters free?—I do not know whether they sent the sepoy's letters free to China, but I think they did.

7783. Do not you think that if there was a small postage adopted for short distances, as you were asked just now, there would be a very great many additional native letters sent, particularly sarafs (native bankers), and letters of that kind?—I do not think so. A man can send a letter for half an anna, which is six pies, that is three farthings; you can hardly get down much lower.

7784. It is a very small sum to us, but not, I think, to them?—Yes, but not in the case of the shroff's letters.

7785. Do you think that the sarafs continue to send letters by means of their own as they used to do some years ago?—I have no doubt they do, but not to the same extent. They have an idea that a very important letter is more safe by a messenger than by the Post Office, but that does not prevail to the same extent. I do not speak with any very great knowledge of the subject.

7786. Mr. *Grant Duff*.] Will you give us, very briefly, an account of the gross revenue that we receive from the police, without going into details?—The total is 287,549 *l.* The first item is the contribution from municipal and other funds, 208,916 *l.*; fees, fines, and forfeitures, 12,115 *l.* Then the railway police; the contribution made by the railway is 35,761 *l.* The railway companies repay that sum to Government. Then there is the municipal Chowkudar fund, which amounts to 3,500 *l.*; that is the sum obtained from people who pay for the services of policemen, firms and others who apply to the Government for a policeman, and pay for it; and then there is a miscellaneous sum of 13,696 *l.*; that is made up of various things, fees for the registry of boats, cattle-pounding fees, and savings of the department.

7787. Have you any reason to suppose that the item of receipt from police will increase?—I am certain that the contributions from municipalities will increase, because very little is got from Bombay on that account, and the Supreme Government has lately called the attention of Bombay to that fact, and it has reduced the police in all the Presidencies of India very considerably. It has not reduced the Bombay police, at least until very lately, but it has told them that they must

Sir H. L. Anderson,
K.C.S.I.

20 June
1871.

Sir H. L.
Anderson,
K.C.S.I.

20 June
1871.

must obtain from the municipalities a larger contribution. Therefore, under that item I am certain that there will be an increase, but not on the other items.

7788. Then without going into any details about the expenditure under the head of Police, I will ask you whether you have reason to believe that from any recent measures of the Government of India the net receipts under this head will somewhat increase?—Very considerably; they have reduced their police expenditure very much; we have not got the working of it yet fairly; I have no return from the north-west of what they have done; but they have reduced the Bengal police by upwards of 60,000 L., and the Madras police by upwards of 40,000 L.

7789. But you can say that generally throughout India you have no doubt that the expenditure on the police will be diminished?—Yes; certainly.

7790. Mr. Cave.] Has that reduction in expenditure been caused by a reduction in the number of men?—Chiefly of officers and assistant superintendent; that was a grade that they thought they could dispense with.

7791. Do you think that the efficiency of the force has been impaired by the reduction?—I hope not; I thought it a very perilous thing to meddle with, but I have not heard that it has.

7792. At any rate, you would not recommend any further reduction?—Certainly not; I think they have done the very utmost.

7793. How does that correspond with what I think you stated about Bombay, that they are told to reduce their police?—They have not reduced the Bombay police so much, but they have told the Bombay Government, "This year we will take your estimate and sanction it;" it was 35 lacs, I think; but they said, "you do not obtain a sufficient contribution from your municipalities." They only get, apart from the island of Bombay, 4,000 L., and that 4,000 L. is chiefly obtained from Scinde. They hit that blot, and said, "You must obtain a greater contribution from your municipalities: you must make a town pay for its own police."

7794. I thought I understood you to imply that that warning to Bombay would probably lead to a reduction of the force?—No, I do not think so, to a great extent; there is a great difference between the Bengal police and the Bombay police, which is not perhaps sufficiently understood. The Bengal population are a very peaceable population indeed; they make their contribution to crime, but it is a very different kind of crime from what the police have to deal with in a repressive manner. Now, Bombay is inhabited by very warlike races, and you must have a strong police there. I fancy therefore the Government of India a little shrink from reducing the Bombay police; but they said to the Bombay Government, "You must get contributions towards it from the municipalities;" which I think is proper.

7795. Are the police chiefly natives?—Entirely, except a few officers, and a very few European constables.

7796. Mr. Fawcett.] Then you think, with reference to a question which you have just answered about the net receipts, that, correctly speaking, the expenditure greatly exceeds the revenue in the department?—I only took the question as the honourable Member meant it;

upon the balance of receipts and expenditure can you show that the Government will gain; and I think they will gain not by increasing the receipts, but by reducing the expenditure.

7797. It is more correct to say that there is a reduction of expenditure then?—Certainly.

7798. As I understand this charge upon municipalities, which represents the chief source of revenue of this department, it is chiefly a repayment; the Government supplies municipalities with police, and the municipalities pay towards that?—Yes.

7799. They farm the police, you may say?—You cannot say that they farm it; I do not think that is the proper expression; it is that the Government say to a municipality, "We find that out of our police corps in that district so many men are required for your town, now we must trouble you to pay for those men."

7800. And your evidence would show that hitherto some of the municipalities have not paid sufficient?—I was speaking then of the Bombay side, where the Government of India gave that order; they have not paid at all, you may say, with the exception of Bombay proper and the towns in Scinde; the municipalities have paid nothing for the police.

7801. Why do you think that a municipality should pay partly for the police, and not country districts?—Because country districts have the shetmudees, a sort of rural constabulary, paid by lands; they hold lands on the condition of performing service; it is a very rude kind of proceeding; but it has existed from time immemorial, and they sufficiently protect all the rural districts. But I think that when you collect capital into a town you require an insurance, and for that insurance people must pay.

7802. Mr. R. Fowler.] Do the police consist of old soldiers?—No, not generally. I remember that when a new corps was got up they drafted some soldiers into it, but I think it was rather the feeling of the commandant; he came from a regiment, and wanted some of his own men down there; but they are not soldiers as a rule. Indeed the corps I allude to was rather what is called a local corps than a police corps.

7803. Then are they under the direction of the military officers?—On the Bombay side only, with two exceptions, but on the Bengal side it is the other way; the Government have said they cannot spare the officers, and they choose the officers out of the uncovenanted service. That supports the remarks I made before; that does very well for Bengal, but I think that you require military officers for Bombay; they are half a military force, and they require to be led; although I am bound to say that the two gentlemen of the uncovenanted service, who were superintendants of police in Bombay, were I think the two best; but, as a rule, I think a superintendent ought always to be a military officer there.

7804. Mr. Candlish.] Do you know the number of police there are in India?—I can give them for each province. In Bengal the number of regular police is 31,709, and of village police, 186,110.

7805. Mr. Eastwick.] When you say Bengal, do you mean the Lower Provinces?—Yes; there is a Return which was moved for in the House of Commons some years ago by Lord William Hay, which would pretty nearly represent what it is now.

now. In the Mofussil of Bombay, the number is 15,770 regular police, and in the island of Bombay itself, 1,350. Then there is an immense number of the rural constabulary; I have no return of that; and in Scinde there are 3,502 of the regular police, and in Aden 133, so that altogether there are 20,815 for Bombay, including Scinde and the island of Bombay. Then in Madras there are 23,433.

7806. And no returns of village police?—No returns of village police.

7807. Mr. *Candlish*.] What is the cost taking the totals?—I have got 36 lacs, that is 363,732 l. for Madras.

7808. For the whole of India it is nearly 3,000,000 l., is it not?—It is 2,434,735 l.

7809. Does that include the village police?—Not those who are paid by land, who render service for land. The 2,434,735 l. is the total cost of all the police in India excepting those paid by land.

7810. Mr. *Edstwick*.] Then those 186,000 in Bengal are paid by land, are they not?—Not entirely.

7811. Could you give the exact number of those who are paid by the 2,434,735 l.?—I could calculate it, but I could not give it at the moment; I could ascertain. The 186,000 cost 351,424 l.

7812. Could you put in a tabulated return showing exactly who are paid out of this sum of 2,434,735?—Yes.

7813. Do you think that the police system could be extended to any other provinces in which it is not existing, for instance take Kattywar; do you think that we could extend the police system there, and withdraw our troops?—I think we have only half a regiment in Kattywar as it is.

7814. Do you think that we could extend our police there at all, and withdraw any of those troops?—Our revenue from Kattywar is derived by tribute, and it is made up of a tribute paid by native chiefs, partly to us, and partly to Guicoway.

7815. Has it not been contemplated at all to extend the police system there?—In Bhownugger they are getting up a police, paid by the native state. The political agent is endeavouring to induce the Kattywar chiefs to employ a police more disciplined than they are now, but I do not think you could quite withdraw that half a regiment that you have there, it is an enormous peninsula.

7816. Is there any other province where the police system could be extended?—It could be extended to every part of India, with the greatest advantages, if the native chiefs would allow it; it is an admirable system.

7817. Have there been any discussions with or applications from the native chiefs on that point?—No, I am not aware of it, except in Kattywar.

7818. Mr. *Candlish*.] Have all the police of India military drill?—Some of the corps have and some have not; every man is taught a certain amount of drill, but not a complete drill.

7819. Mr. *Lyttelton*.] Is it on the model of the Irish system of constabulary?—I fancy so; they say with regard to a policeman, that you can over-drill him very easily, and that if you over-drill him, he cannot act by himself, and therefore the thing to be aimed at, is to give him a knowledge of the use of his weapons, whatever they may be, and that is all, so as to enable him

to act alone; but some police corps are drilled because they are almost military bodies, the Kundaish Bheel Corps, for instance.

7820. Mr. *Dickinson*.] Are there any mounted police?—Some, not a very great number, but the Government of India have been reducing them.

7821. Mr. *Beckett Denison*.] Can you tell the Committee the comparative cost of a thousand men of the police compared with a thousand men of the native army?—The pay of a policeman begins at five rupees a month and goes up to six, and the pay of a sepoy is seven rupees a month.

7822. And also the officers of the police are paid less?—No, but they are fewer.

7823. Mr. *Grant Duff*.] Will you shortly give us an explanation of the educational receipts?—The total receipts for education are 74,889 l. for 1869-70; that is made up in this way. There are fees and contributions, endowments you may call them, amounting to 42,648 l., the sale of school books 26,474 l., fines and miscellaneous, 1,691 l., and entrance fees of Calcutta University, 3,987 l., making a total of 74,889 l.

7824. Mr. *Fauvelt*.] Is the 26,000 l. for the sale of school books, the gross or the net receipt?—The honourable Member is quite right in asking the question, because in some it is the net, and in some the gross. For instance, Bengal is put down at 204 l., Bombay at 10,457 l.; that is because one puts down all it sells, and the other only puts down what the receipt is above the sum advanced from Government.

7825. Do not you think that it would be advisable, and could not something be done to prevent these rather extraordinary differences in the account?—Since this inquiry commenced, I spoke to the financial secretary, and proposed to the financial secretary to send out instructions that all the expenditure should be furnished on the one hand and all the receipts on the other. For instance, in this education return only 74,000 l. is put down for the total; that leaves out of sight the enormous sum now got for education from local funds. The total cost of education in India is 1,210,076 l. for the year 1870, of which 622,575 l. is from Imperial funds, and 587,501 l. from local funds; but this account does not put down what is got from the local funds in that way, because all money thus obtained is spent. The proportion of the expenditure from local funds is 587,000 l.

7826. Mr. *Cave*.] Are those local funds obtained from a cess upon land?—They are in Bombay; the North West, Oude, the Punjab, and Madras, not in Bengal yet. Bombay takes one anna outside the assessment; that is to say, if a man is assessed at one rupee, we will say, they take the one rupee and then they take another anna.

7827. But in Bengal it is not a cess?—No; there is a great discussion still going on on the question whether you can assess land under the permanent settlement.

7828. But how do you get the money for education now from Bengal?—In Bengal they get a very large sum from fees. The rural population there are much more wealthy than they are in Bombay.

7829. Mr. *Denison*.] But at present, unless special instructions are sent out from England, a very large sum now debited to local funds, both revenue and expenditure, will escape the purview of Parliament, that is to say, that expenditure will

Sir *H. L. Anderson*,

1871.

will not find a place in the account submitted to Parliament?—I do not think it will.

7830. The administration of local funds, road funds, and so on, I think, does not form a part of the accounts laid before Parliament?—Educational cesses are shown in the departmental account. I do not know whether they are shown in the Parliamentary accounts.

7831. Mr. *Fawcett*.] The accounts that you are referring to now are those which we, as Members of the House of Commons, have to obtain our opinion from as to the financial position of India, are they not?—Yes; but of course they have not entered in these accounts the sums received from local sources, because they are all spent, as it were.

7832. Referring again to that item of 26,000 £. for sale of school books, I think, if properly examined, it will illustrate the system; that 26,000 £. is entered as sale of books, but it really shows nothing whatever; in one case it is a gross receipt, and in another part of India it is a net receipt; therefore it does not tell you how many books the Government have sold, or whether they have realised a profit or loss from the sale of those books?—No, it does not.

7833. Therefore an account of that kind is really worthless, and it tells you nothing?—I would not quite say that, because the departmental account can always be obtained.

7834. But what I want to get at is this: for instance, I have not the privilege of examining you at any time, and unless I make a special application for departmental accounts, these now before us are the accounts from which I must draw my conclusions?—Yes.

7835. Therefore I say that this account tells you nothing whatever with regard to that item; is it not so?—I do not think that it tells you nothing whatever, but it tells you the story very imperfectly.

7836. I suppose the object of the Government is not to make any profit out of the sale of books, but to meet risk of loss and so on?—Yes.

7837. Do no accounts except the departmental accounts show the local contributions for instance to education?—The departmental accounts show them, but these do not.

7838. So that really these accounts would produce the erroneous impression that something like 500,000 £. a year less was spent in education than really is?—I do not think that the education account could mislead anybody; they have put down the whole educational revenue at 74,000 £., and that is absurd, of course.

7839. I mean the expenditure not the revenue; what is put down there as the expenditure; I will not enter into the policy of the expenditure; but simply as a matter of account, what is it?—£. 868,626; but that includes items which do not properly belong to education, and are now separated; science and art is taken out of education now.

7840. Therefore there is nothing in those accounts to indicate the local contributions to education?—Not in the Finance and Revenue Accounts, certainly; I told you that the total local expenditure was 587,000 £.

7841. Mr. *Birley*.] Is there any general system of assessment for local burdens?—Yes; but it is not uniform; for instance, the North West Provinces used (there has been a little alteration) to divide the local expenditure into two parts,

one of which the Government paid, and one of which was paid by local cesses. But now they have altered that, and where the Government took 50 per cent. it now takes 55 per cent., and out of the odd 5 per cent. it pays for roads, education, and other local expenditure.

7842. What is it in other provinces, in Bengal, for instance?—In Bengal they have not got it yet; there has been a great discussion about it, and it is not finished yet.

7843. But they do raise local rates in Bengal?—The municipalities do; it is done by committees; they raise a local revenue.

7844. But for municipal purposes?—Yes.

7845. Are they incorporated cities, as we should call them?—No. There was an Act passed several years ago, and any municipality may apply to have a committee appointed under that Act. Bombay takes one anna on the assessment, and that one anna is divided in the proportion of two-thirds to roads and repairs, and one-third to education.

7846. Does that mean that if the assessment is a rupee, an anna is added to it?—Yes.

7847. Very much like the French system of the additional centime?—Yes.

7848. Are there any other variations in India?—I think the Punjab takes 2 per cent., and Madras takes 2 per cent. on the assessment.

7849. Mr. *Jyttelton*.] How do the people bear these burdens for educational purposes?—I have never heard any complaint in Bombay, that is because the assessment is very low there under the revised settlement, but they have recalcitrated very much in Bengal, even at the mere idea, because they have a permanent settlement.

7850. Mr. *Fawcett*.] How do they obtain from Bengal, if they cannot levy it on land, this local contribution to the educational fund at the present time?—Very largely in this way; that being a much more wealthy population than any other part of India, they are much more ready to pay fees.

7851. But is there nothing that will at all bear the character of an educational rate extending over the Presidency of Bengal?—Not yet; the matter, as you are aware, is under discussion. Then the municipalities, I think, pay something. They have there what is called the grant-in-aid system, which differs a great deal in different parts of India. In Bengal the town or the place makes a petition to the Government, and says, "We want a school, we will give a building; or we will pay half the expense of the building, and we will subscribe and guarantee so much money." The Government then takes the petition into consideration, and makes a contribution according to the want of the place. It never goes beyond an equal sum to what the place itself has contributed.

7852. But then what it comes to is this, is it not, that if really an educational rate or tax is levied in Bombay and other parts of India and not in Bengal, Bengal at the present moment pays less than its share of taxation?—Yes.

7853. Suppose that those views prevail, in consequence of the permanent settlement in Bengal, that it would be unfair to obtain an educational rate by increasing the assessment on land, has there been any other suggestion made as to how you could obtain it?—I ought to mention that what you want to meet is, primary education, education of the masses; and some persons pro-

posed to do that by levying an educational cess. The road cess was a good deal objected to; but I think, as to the road cess, that the old zemindars were bound to keep up communication between the different villages; and that the Government will no doubt get. The educational cess is a greater difficulty, and is still under consideration. What the municipalities pay for are not quite primary schools, but schools of a higher kind, and what you therefore want in Bengal, if you can have it, is to get a fund for primary education. In Bombay they have a different system; they have the English system of payment by results, and they pay according to the number of pupils that the schoolmaster can educate up to certain prescribed standards. I think that there are six standards, but they only begin with the fourth. They get so much a head for each pupil at the fourth standard. If a man can educate three pupils to pass an examination in the fourth standard he gets 10 rupees for each, and also a capitation of two on each head. Then for the third, it is higher; and then there is the matriculation. In Bombay they pay in that way by payment for results; but in Bengal it is by petitioning Government to make an equal contribution to theirs, or any sum in aid of their contributions.

7854. But as I understand you, the reason why you cannot levy or hesitate to levy this educational cess in Bengal is owing to the permanent settlement?—Yes.

7855. Then if this hesitation should continue, or the opinions of those prevail who think that it ought not to be levied in consequence of the permanent settlement, you would be unable to obtain, would you not, this assistance which you think necessary for the education; there is no other means of obtaining it, is there?—No; the people say, "You have made in Lord Cornwallis's time a contract with us to take so much, and no more, from us on account of our lands: and taking an educational cess from us is a breach of that contract. The Imperial expenditure in Bengal on education is about 18 lacs, and what they get from private sources is only 13. Now, in Bombay, they get more from the local funds than they do from the Imperial Exchequer."

7856. I have put these questions as indirectly having an important bearing on the permanent settlement; and we come to this, that the existence of a permanent settlement in Bengal may create very serious obstacles to the education of the people?—It has done so I consider; but I have very considerable confidence in the present Lieutenant Governor of Bengal, who is a man of great ability, Mr. George Campbell. He does not want to press this question of the cess at all, but he hopes to be able to take the people with him, that they will assess themselves for education; and that he will get something out of them in that way. I hope that that will be the solution of the whole difficulty.

7857. Mr. Cave.] Does the Government assist any except primary schools?—It is just the other way; the bulk of the expenditure is upon the higher education not upon primary schools.

7858. Are there different sorts of education given in the same school, and are the different classes educated together?—They are schools which are Anglo-vernacular; that is the term, and they include both.

0.59.

7859. And different classes are educated in the same school?—Yes.

7860. Then, practically, I suppose the fees paid by the richer classes contribute towards the gratuitous education of the poorer; is that the case?—No; I think that the Government contribute to the gratuitous education of the poorer classes.

7861. The fees paid by the richer classes do not pay more than for their own education?—No; they are comparatively very small; they range from half an anna in a primary school, to 10 rupees in the university, a month.

7862. Is there any unassisted education in the upper classes; I mean are there any schools in which the upper classes pay for a superior education for themselves?—No, it is open to all; there are what are called high schools, and the fees really are so low that most of them can pay them.

7863. I mean are there any schools besides Government schools?—There are what are called indigenous schools; there are a great number of private schools which are aided by grants-in-aid.

7864. But are there any private schools purely speculative and not aided at all?—There are several which are not aided, but are inspected.

7865. And those get no aid from the Government?—They get no aid from the Government.

7866. Many of the natives in India are very highly educated indeed, are they not?—Yes; education given in Government schools is the best.

7867. Mr. Bourke.] With regard to the question asked by the honourable Member for Brighton as to the permanent settlement in Bengal, now, do you think that the permanent settlement would prevent us from taxing land for educational purposes?—Well, I hardly like to give an opinion; you know I am not a Bengal civilian; but I confess that I cannot get over the difficulty myself. I think that the permanent settlement is a bar.

7868. Whether the settlement has been for 20 years, or whether the settlement has been for 30 years, would your opinion equally apply during that 20 or 30 years as it does to the permanent settlement?—You are probably alluding to Bombay and the 30 years' settlement. I think, as a matter of exact right, that you have no more right to take an educational cess during the 30 years from Bombay than you have from Bengal during the permanent settlement; but then the Bombay rates, under the revised assessment, are so low, so infinitely advantageous to the ryot that he was very willing to pay it, because he knew that if he did not pay it then, he would have to pay when the term was out.

7869. Mr. Dickinson.] The honourable Member for Brighton called your attention to the difference in Bengal and Bombay and the North West Provinces, with reference to the education cess, it being considered local in the one case, and there being no contribution in the other; do you consider the education cess to be a local contribution?—Certainly it is for local purposes.

7870. Is it a local contribution from local funds; what I mean is this: you were asked just now whether Bombay, for instance, did not pay more for education than Bengal, because there was a local cess for education in Bombay, and there could be none in Bengal, on account of the permanent

1871.

manent settlement?—There are local funds in Bengal, but there is not a cess.

7871. The point which I wish to bring before your attention is this, whether you consider that the educational cess paid out of the land is a local or an Imperial contribution?—A local one, because it is applied to local purposes.

7872. Does it arise from a local source of taxation, or from an Imperial source of taxation?—It arises from the same subject matter as the Imperial one, because they are both taxes on land.

7873. In the North Western Provinces, you see, it is actually taken as part of the Imperial taxation and repaid, so that, in point of fact, the contribution to the local cess is in truth a contribution to the Imperial revenue, and not to the local revenue; if that is a true description to apply to it, of course you could not raise it in Bengal where the permanent settlement applies;

therefore I ask, do you consider it a local or an Imperial revenue?—It is derived from the same source as the Imperial revenue, but it is applied to a local purpose. The Government cannot get any benefit from it; the Imperial revenue is that which goes into the local exchequer and is spent for Imperial purposes.

7874. Mr. Fawcett.] But is not it a sum which might be devoted entirely to Imperial revenue, and which is partly devoted to local purposes. That describes it exactly, does it not?—No; the Government of Bombay have said, "We will take a rupee for the land revenue, and that rupee is to go into the Imperial Exchequer for Government purposes." It then says, "Now, for your own good you are to pay another anna, a seventeenth anna; but we are not to gain any advantage from that, that is to go to local purposes."

Friday, 23rd June 1871.

MOUNTSTUART ELPHINSTONE GRANT DUFF, ESQ., IN THE CHAIR.

SIR HENRY LACON ANDERSON, K.C.S.I., re-called; and further Examined.

7875. *Chairman.*] I BELIEVE you wish to make an explanation with reference to some of your former answers respecting registration fees, stamps, and postages?—Yes, there was an item in the registration fees which there was some little discussion about on the last occasion. I said that it was a gross receipt, and the honourable Member for Brighton suggested that it was only the net receipt, and the accumulations; and I was staggered at the moment, because, at the top of the item I saw the words, "Fund and Fees." But I have looked into the matter, and I find that I was quite correct originally; that it is the gross receipt, and that the accumulations are not entered into the account. And there was one other explanation which I wished to make in justice to the honourable Member for Brighton, on another subject. I said that $7\frac{1}{2}$ rupees per cent. was the total sum that the suitor had to pay to Government, but I forgot, for the moment,

one item, which I will now mention. If a man appears by his representative, that representative has to produce a written authority, and that written authority must be upon stamped paper, at a fixed duty of 8 annas. It is not necessary that a man should have a representative; I fancy, in the very small suits in the lower courts, the man does not appear by representative, but in person; and, therefore, that expense would not come upon him. I had overlooked that 8 annas which the man pays for the paper on which the authority to his vakeel is written. Then the honourable Member for Falmouth asked me whether the sepoys' letters went free. They do go free; but, since the honourable Member was in India, the franking is done away with. Now the sepoys' letter is stamped by the commanding officer, and at the end of the month he recovers the stamps, so that those letters substantially go free.

Sir H. L.
Anderson,
K.C.S.I.

23 June
1871.

Mr. WALTER R. CASSELS, called in; and Examined.

7876. *Chairman.*] You have been long in India, I think?—I was there for about 10 years.
7877. In what part of India?—In the Bombay Presidency.

7878. You were a merchant there, I think?—I was a merchant.

7879. And are you still connected with India?—Not at all; I am not in business.

7880. Did you serve in any public capacity there; were you in the Legislative Council?—I was in the Legislative Council; and I also, at the request of the Government, wrote a history of the cotton cultivation in the Bombay Presidency.

7881. To what particular matters do you come to-day to speak?—I shall be happy to give any information in my power that the Committee may desire; I have not been particularly informed as to the object of my examination.

7882. You have given a great deal of attention, of course, to the Indian tariff?—Yes.

7883. Have you any suggestions to make for its amendment, either for the purpose of making it press more lightly upon the taxpayer, or else for the purpose of producing better receipts?—With regard to customs (in the first instance, I suppose, you speak of them), I think that the

import and export duties are extremely unadvisable. They hamper the trade to a very considerable extent, without producing any very large revenue for Government.

7884. Would you go the full length then, of abolishing all import as well as all export duties?—Certainly.

7885. But supposing that Government did not see its way to so strong a measure as that, what particular export duties are there, and what particular import duties are there, of which you think there is most reason to complain?—All being objectionable, it is rather difficult to point out the most objectionable; but I should think that, for instance, an import duty of 5 per cent. on Manchester piece goods, and of $3\frac{1}{2}$ per cent. upon yarn, is an objectionable tax; it limits consumption, and it hampers trade very much.

7886. With regard to export duties, which do you think most objectionable?—Well, with regard to the export duties, I can scarcely point out any in particular. The only ones that I can name now would be, for instance, the duties upon grain; and I think some of those press very heavily indeed upon different parts of India. The first that occurs to me, is the duty upon rice. I remember to have seen the petition of the

Mr. W. R.
Cassels.

Mr. W. R.
Cassels.
—
23 June
1871.

merchants at Akyab, which shows that the duty upon rice amounts to 14 per cent. of the price paid to the grower; and I am afraid that this duty is very nearly crushing the trade.

7887. But now, confining yourself to the parts of India which you know personally, can you point to any export duty which you think is specially obnoxious?—I think that, upon oil seeds and all other seeds, it is a great pity to have a duty; you cramp the development of the export trade of India; and I suppose that the productiveness of the country, the excess of production over consumption, is the key to the prosperity of India.

7888. Do you think that if there was no export duty, oil seeds would be largely exported from the Bombay Presidency?—It would tend, of course towards that.

7889. Have you any reason to think that they would except your general impression?—No, except that they are burdened by charges which, of course, render them less able to compete with seeds from Russia and elsewhere.

7890. You cannot point to any particular seeds which you think would be largely exported if there were no export duty on oil seeds?—Not absolutely.

7891. May I ask you if you think that we should sweep away export and import duties in India only, or do you belong to the not very large, but certainly very important, school of financiers, who are opposed altogether on principle to customs duties; would you be opposed to customs duties in this country?—I should be opposed to customs duties in this country upon articles of trade where the duty would amount to a protective duty. Now that is the case with the import duties in India. I consider that they are protective duties, enabling the Indian manufacturer, for instance, to compete with advantage against the Manchester manufacturer.

7892. Do you know the views that are advocated in the newspaper called "The Financial Reformer"?—I do not think that I have ever seen it.

7893. But you have no practical suggestion to make to us with regard to the Indian customs, except to sweep away import and export duties altogether?—No.

7894. And you are confident, I suppose, that if we did so we should sooner or later be recouped by the increased prosperity of the country?—Certainly.

7895. And by the power of the population to bear other taxes?—Yes, I feel quite confident of that.

7896. Sir D. Wedderburn.] I suppose that the export duty upon rice and other grains of which you spoke works badly in times of local scarcity and famine, by preventing the free transport of grain by sea from one part of India to another?—No duty is now charged on grain shipped from one port to another in India.

7897. Mr. Bruch.] If all the duties were to be swept away, have you given your attention to any mode in which you would make up the deficiency in the revenue which would ensue?—In the Bombay Presidency I think that the amount which would be lost, which, I think, is only about 750,000*l.*, might be made up in an increased land tax.

7898. But where the permanent settlement is in force, what then?—The permanent settlement does not apply to Bombay.

7899. But you must take the whole of India into consideration; where the permanent settlement has been made, no increase could be expected from that source?—No; and that would be one reason for doing away with the permanent settlement, if it were possible.

7900. But you would have, would you not, to apply the same system to the whole of India, if you swept away the import and export duties?—Undoubtedly; but I think that the amount of the duty is so unimportant that it could very easily be recouped in another form.

7901. Mr. J. B. Smith.] Are you aware that the income from Customs in the year 1870-71 amounted to 2,655,000*l.*?—Yes; the gross income.

7902. And that that forms more than five per cent. of the income of India?—Yes; but there is a very considerable deduction to be made for expenses.

7903. The expenses of the Customs are put down here at 192,000*l.*?—Yes.

7904. Do you think that it would be judicious, on the part of the Indian Government, to give up so large a revenue without some substitute for it?—Certainly not.

7905. And what substitute would you propose?—Well, it is rather difficult to say at once, but I have indicated one source. In the Bombay Presidency, for instance, I consider that the revenue from the land ought to be considerably greater than it is.

7906. But is not the land of the Bombay Presidency assessed for a certain period, or on a 30 years' assessment?—A great part of it; but the re-assessments are commencing now. It was a 30 years' settlement; and a great many of those assessments are falling in now.

7907. But you are perhaps aware that there are other items in the Government receipts which are of a doubtful character, and which render necessary these increased receipts from land revenue; I refer particularly to opium?—Certainly; there is no doubt that that is a very precarious income indeed.

7908. Taking all these circumstances into view, would it be judicious, on the part of any Government, to interfere with the Customs' duties at present?—I cannot think that anything is judicious that cripples the trade of the country.

7909. Have you any evidence that it does cripple the trade of the country?—It is very burdensome upon trade as a mere matter of trouble. I think that if the duty upon all articles which do not yield a revenue above 10,000*l.* were done away with, there would only remain 20 articles subject to Customs' duty. This shows that for anything that you send out of the country, or import into it, there is a process to go through which is extremely burdensome.

7910. What are those articles?—I can scarcely mention the whole of them; but I know that what I state is the fact.

7911. You have stated that you thought that the duty on the import of cotton goods from England was an impolitic duty?—Yes.

7912. Because in your opinion it is a protective duty?—Yes.

7913. Now supposing that that duty amounts to 5 per cent., if 5 per cent. were also levied upon the Indian manufactures, that would put them all on the same footing, would it not?—It would so far.

7914. As the Government cannot afford to lose

lose any revenue, if this duty be complained of as a protective duty, then would not the best plan be to lay a similar duty upon Indian manufactures?—No; I am not prepared to advise that at all. I think that they might make up the loss of duty in other ways that would be less hurtful to the country.

7915. But you have not pointed them out, as I understand?—But I may show the impolicy of the present system without being prepared at once to tell you what new taxation to adopt in India; that is the duty of the finance minister.

7916. You have paid some attention, no doubt, to the cost of the transit of the different articles of produce in India?—Yes.

7917. Before the introduction of railways, the cost of conveyance of every kind of produce was very considerably more than what it is at present?—Yes.

7918. Now take the article of cotton; you are aware that India has to compete with America; you are aware that in America, in most of the cotton districts, there are large rivers, by means of which the cotton is conveyed at very small expense; now do you think it is possible that India can compete with America if they have to pay four or five times the amount for the conveyance of cotton to the port of shipment that the Americans have?—Certainly not.

7919. Then under those circumstances do you not think that, where it is practicable, the same means should be adopted in India that there are in America, of making the transport very cheap?—Certainly; it is the most important thing to be done in India; and I may mention, perhaps, that I bear this in mind in recommending the abolition of the export and import duties; I am not prepared to say that the Indian Government is not able to give up those duties; I think they are.

7920. Are you acquainted with the River Godavery which leads into the cotton districts of Berar?—I know it.

7921. That river you are perhaps aware is not at present navigable, but a portion of that work is completed?—Yes.

7922. Now if by means of that navigation the growers of cotton in India were able to transport their cotton to a port of shipment as cheaply as the cotton growers on the Mississippi can take their goods to New Orleans, would not that enable the cotton growers in India better to compete with the Americans?—Certainly; I think that it is owing entirely to the rapid progress which has recently been made in the construction of railways into the cotton districts, and also, to a smaller extent, of roads, that India has been able to send as much cotton as she has done.

7923. By means of the railway from Bombay?—The Baroda Railway and the Great Indian Peninsula Railway.

7924. The railway from Bombay to Berar?—Yes, the Great Indian Peninsula Railway.

7925. That has enabled the producers of cotton to send their cotton by that railway instead of sending it 500 miles on the backs of bullocks?—Yes, the bad condition in which Indian cotton always formerly arrived at market was due to the deficient means of transit.

7926. But must not the expense of carrying cotton on the backs of bullocks 500 miles be very large?—Enormous.

7927. Are you aware that in reference to the cotton from Berar it was more than the value of the cotton?—Yes, I believe it was.

Q.59.

7928. And although the railway is made from Bombay to Berar, the cost of conveyance is perhaps three or four times as much as it would be by means of the river?—No doubt the transit by river would be more economical.

7929. Then, is it your opinion, that it would be an advantage not only to the growers of cotton but to the Indian Government, if that river was opened and a cheap conveyance was made?—Most certainly.

7930. Because it would enable the population of those districts to obtain supplies of different commodities, besides helping the trade in cotton?—Certainly.

7931. Take the case of salt; are you aware that salt in the Central Provinces is dearer than in any part of India?—Yes, I am.

7932. And that that is solely owing to the expense of carriage?—In great part.

7933. And you are aware also that there have been great discoveries of coal made on the banks of the Godavery and in Berar?—Yes.

7934. And that it is known that there are large deposits of iron in that district?—Yes, I am aware of it.

7935. Then under those circumstances, if the Indian Government want to increase the revenue, is it your opinion that one of the best means of doing so is to develop the resources of a country like that by opening out the rivers?—Most certainly.

7936. And would you think it desirable for them in such a case, instead of opening out the rivers, to make a railway?—It depends of course upon the amount of expenditure required to open out the rivers; I think that the more rapid and the less expensive the means of transit the better for the country.

7937. But if you were told that a river could be opened for 2,000 *l.* a mile, do you think that any railway could be made for that?—No, certainly not.

7938. And you are aware that a river can carry an illimitable amount of commodities?—Yes.

7939. And that the amount sent by a railway must necessarily be limited?—Yes.

7940. Especially when that railway is one line of railway?—Yes.

7941. Then is it your opinion, that if the Indian Government want an increase of revenue, the best way of getting it is to take courses like that of opening up the country, and giving the people the means of consuming taxable commodities?—Yes, that is one means; I consider that all works of that kind in India are reproductive works.

7942. And that in the end the works, in fact, will cost nothing?—They will cost much less than nothing; that is to say, they will bring a profit to the Government.

7943. You are aware that the great Ganges Canal, which has been so many years in construction, is now paying 7½ per cent. per annum?—Yes.

7944. But is not that a very small part of the advantages that we derive from that river?—Very small. I do not know whether you remember Colonel Baird Smith's Report on the Famine of 1860. He showed that while the profit to Government under the permanent settlement was extremely small from these canals, as a means of irrigation, the profit to the zemindars resulting from them was enormous. Taking four

estates

estates from the canal villages of the Meerut district at settlement, and at that time, he found that the total area irrigated at the settlement was 2,599 acres, and in 1860-61, 8,362 acres; of unirrigated 4,567 acres at settlement, and only 541 acres in 1860-61. The Government revenue which was fixed amounted to 27,699 rupees, but the gross produce of the four estates, which had been 73,850 rupees at settlement, had increased to 140,114 rupees, or an average of 89½ per cent. On one of the estates the per-centage of increase is stated at 123. At settlement the average revenue rate on the irrigated area was Rs. 11. 9. 2., and in 1860-61 this had decreased to Rs. 3. 8. 6., and on the area of cultivation Rs. 3. 12. 7. at settlement had fallen to Rs. 3. 2. 8. in 1860-61. That was the result of the irrigation. Then, for instance, on the other hand, taking 17 villages in the district of Saharunpore in 1841 compared with 1860-61, the rent roll of the whole at the settlement in 1840-41 was 16,050 rupees, and in 1860-61 it amounted to 36,970 rupees; but the revenue was 11,609 in 1840-41, while in 1860-61 it was only proposed to increase it to 16,258; the per-centage of increase of the rental was 130 per cent., but the increase of the Government revenue was only 40 per cent. These estates are irrigated from the Eastern Jumna Canal.

7945. And was that increase of 40 per cent. of the Government revenue derived from the irrigation?—It was greatly the result of it, but the rates seem very much mixed up with the revenue.

7946. It being a permanent settlement they could not increase the rent?—Not in the former case, but they charged for the water.

7947. The only way in which they could increase it was by the irrigation rate?—Yes.

7948. Therefore that irrigation is another source of revenue, is it not?—Certainly; it would be especially so in the Bombay Presidency; but of course, under the permanent settlement it was a very small source of revenue to Government; public works do not pay in Bengal as they would in Bombay.

7949. But as far as you know Bombay, you would say that the Government could not make a better investment than in raising money for irrigation works?—Certainly, raising money for that, but not paying it out of taxation.

7950. You would say that being reproductive works, they ought to be executed by means of loans?—Certainly; and that we should borrow money at 4 or 5 per cent. instead of taking money out of the pockets of people who can employ it at 25 per cent.

7951. But is there not another advantage, namely, that when they raise money by loans, they have a sufficient amount on hand to complete the works?—Certainly.

7952. You are probably aware of the enormous cost of the Indian public works in consequence of their being executed out of revenue?—Certainly.

7953. And that, therefore, whenever the revenue falls short, the works have to be suspended entirely at a very great cost?—Yes.

7954. Sir T. Bazley.] In the event of the Customs duties being abolished in India, do you think it would be possible to reduce the expenditure of the Government to the amount so reduced, say, two millions and a half?—No, not so much; the cost of the Customs establishments is not so great as that.

7955. The Customs, I think, are productive to the extent of two millions and a half?—Somewhat less; I do not exactly know what the expenses are, but the receipt is something about that, I suppose.

7956. To what extent do you think it would be possible to reduce the expenditure in India by general economy?—If I were asked what I considered to be annual expenditure, I should not class as such the carrying out of public works which are reproductive; I speak, of course, more especially with regard to Bombay, and I cannot conceive that any public work in the shape of a road or a canal is unproductive in Bombay. I consider that it is immediately reproductive, upon the terms of the settlement itself.

7957. Probably you would recommend the adoption of a reproductive public works' account?—Yes, certainly.

7958. You are not aware that such an account does exist in India?—I am aware that it does not at the present moment.

7959. Then, is there any other method of compensating for the reduction of the Customs duties that you can suggest, and supposing they were abolished?—Well, if I may be permitted to say so, speaking always of the Bombay Presidency, it seems to me that the land revenue, put upon what I would consider a perfectly fair basis, ought to compensate, and much more than compensate, for the giving up of the Customs duties.

7960. Judicious investment in public works, no doubt, would increase the general prosperity of the country?—Yes, and increase the land revenue.

7961. Should not those who participate in that increased prosperity contribute to the revenue of the country so as to compensate in some measure for the giving up of the Customs duties?—Undoubtedly.

7962. Then you state that you think the Customs duties can be reduced to prevent the increase of a protective system in India?—I say that they are protective duties. I do not advocate their abolition solely for that reason. I do not know whether you are aware that, for instance, in the Bombay Presidency there are 12 cotton mills employing (a very small amount of course for Manchester) 319,394 spindles, 4,199 looms, and 8,170 hands; consuming, I think, 62,000 bales of cotton of 400 lbs. each annually.

7963. And are those mills returning to the proprietors compensating profits?—Some of them pay very well; they return 8 per cent., 9½ per cent., 5½ per cent., 7½ per cent., and so on; but I do not think that they are nearly as profitable as they might be.

7964. Is there any tendency to extend or increase them?—Yes, I think so.

7965. Then you would think, as a matter of prudence, probably, that there should be at all events no protective duty in operation?—I think that the system of protective duties is bad; that which cannot protect itself does not deserve protection; and I think that they can protect themselves perfectly well in India.

7966. Have you any idea of the wages paid in those manufactories?—I cannot say what they are. I know that they produce very good cloth and good yarns, although of the lower numbers only.

7967. Is each individual capable of producing by his labour as much cloth and yarn as in the Lancashire or Lanarkshire mills?—No; certainly not.

7968. What

7968. What do you suppose to be the daily wages of the people employed?—It would be a guess merely if I named a rate; I have not made it the subject of inquiry.

7969. Would it be half a rupee a day, should you think?—I should say about that.

7970. *Mr. Dickinson.* Where are these mills?—Some of them are at Coorla, in the immediate neighbourhood of Bombay; three of them are in Guzerat: one at Ahmedabad, one at Broach, and one at Surat. Perhaps I should mention the dates of the establishment of the mills. One of them, the Broach cotton mill, was established in 1854; two of the others were established in 1856; other two in 1860; another one in 1862; then two or three in 1864 or 1865; and the last was established in 1867, at Ahmedabad.

7971. *Sir T. Bazley.* Is the cloth produced in those mills equal to the cloth exported from this country?—Quite equal in certain goods, and sometimes really preferred by the natives.

7972. Is the cloth starched or fed with clay?—Comparatively speaking, they are very pure made goods.

7973. But the English goods generally are starched?—Yes; there is a great deal of filling in some of them; I do not say in all.

7974. Would it be possible to diminish considerably the expense of the army in India?—I think that if India were entirely opened up by roads, and means of communication were easy, the expense of the army would be diminished.

7975. But the railway system has already given great facility for the moving of the army, has it not?—Yes; but I do not now allude to public works and roads in that sense. I believe that railways have done more in a very short time to civilise India than anything else, and that all that is required to do so thoroughly is to open up the country. If you civilise, of course your army, as a natural consequence, is no longer required to the same extent.

7976. Are you aware that Colonel Kennedy stated, when the railways were being projected in India, that their establishment would very considerably reduce the cost of transporting the troops, and that therefore there would not need to be so large an army in India?—I am not aware that he said so; but I believe it to be a fact.

7977. And that the extension of those works would further increase those facilities, and probably diminish public expenditure?—Certainly.

7978. *Mr. Lyttelton.* Do you think that if Manchester goods were admitted free, these mills which you speak of would continue to be profitable to the proprietors?—I think so; they have got cotton that has been saved a double journey, in the first place as raw material, and then as manufactured goods. Although the cost of labour in India is comparatively higher than in England, I think there can be no doubt whatever that they can compete with England.

7979. It is the case, is it not, that although Manchester goods pay an import duty, they are largely used in India, and by the mass of the population?—Certainly, very largely.

7980. Did you say that labour was dearer in India than England?—I think that labour is dearer, considering the amount of work that is done by a man in India as compared with that in England, and expenses generally are greater.

7981. Are English articles of clothing at present, in India, cheaper than the Indian home-

made articles?—No; they are sold, of course, on a par. The same goods will fetch very nearly the same price; in some cases I have known a higher price paid for the native than for the equivalent English-weight of cloth.

7982. Do not the natives show a preference for English goods?—The piece-goods dealers are very intelligent, and know very well the qualities of cloth, and they of course prefer the best and cheapest.

7983. Is it your opinion that the great mass of the people buy some articles of English clothing?—Yes, I think so, very largely.

7984. And that, therefore, the great mass of the population are affected by the import duties on Manchester goods?—Certainly; I may say, however, that sometimes the European alone has borne the import duty. I remember when Mr. Wilson was the Finance Minister, that by sudden announcement, which was made by telegram to Bombay, he raised the duty on piece goods to 10 per cent., and that on yarn to 5 per cent., from the day that the announcement was made, and he inserted a clause reserving the right to merchants who had sold goods to arrive to make the buyer pay the increased duty; but I believe that universally that had to be abandoned, and certainly there was not a rise of 5 per cent. in the price of goods; that was taken out of European pockets.

7985. Then is your objection to import duties mainly because of the burden they cause to the native population, or is it founded upon general economical considerations?—It is a burden; it is a hindrance to trade; it is an expense beyond the duty to English houses. For instance, one has to keep a clerk who is pretty constantly in the Custom House; and there is so much formality with regard to the collection of duties that it is a great hindrance to trade, and of course it increases the price of goods.

7986. Is there any other article in the Customs receipts which is generally used by the mass of the population?—I imagine that the duty upon seeds must affect the mass of the population also to a certain extent in repressing the trade, if it be admitted that the trade would increase in proportion to the cheapening of the article; that is of course a matter of opinion.

7987. Is it your opinion that the poorer classes in India are able to bear any taxation over and above the salt tax?—The great mass of people in India now (I speak of course again for the Bombay Presidency), I think, are extremely well off in comparison with what they were. No one can be in India without seeing the immense improvement in the condition of the people in wealth and otherwise.

7988. Then the poorer classes ought not to be absolutely relieved of this burden; it ought to fall upon them in some other way?—I think the salt tax a very heavy burden upon the poor, and that the people of India are not quite equally taxed; the rich escape a great many taxes which fall upon the poor; it is very difficult to avoid that, but I think it is the case.

7989. You do not think that the great mass of the population should be taxed over and above the salt tax?—Yes, I do; that is to say, I think there is no reason against it, but I say that there is a great deal of money to be got from the rich in India.

7990. But if you take off all import duties, and compensate for that relief by adding to the land revenue, you will be absolutely relieving the poorer

Mr. W. R. Cassels.
—
23 June
1871.

Mr. W. R. Cassels. poorer classes in India, will you not?—I beg your pardon; I do not consider the land revenue a tax at all; it is rent.

23 June
1871.

7991. As to the income tax, do you think it would be right to compensate for the relief afforded by the remission of import duties by an income tax?—I think that the income tax is a very unpopular tax in India, chiefly on account of its inquisitorial character of; but I do not think it is an objectionable one provided you do not go too low; I think that incomes of a certain amount may fairly be taxed through the income tax.

7992. You seem to think that the poorer classes are not too heavily taxed, and yet, as I understand, you do not propose to tax them in any way when you have relieved them of the burden of the import duties?—I am not sure that you require to tax them; if you had to provide money for the expenditure of India, I have no doubt that means could be devised; but I do not see the propriety of these taxes; I think them injudicious; I do not say that some other tax may not be judicious, but I think that those in particular are injudicious, because they hamper trade and interfere with the prosperity of the country.

7993. Mr. Eastwick:] I do not think you have stated yet the period at which you arrived in India, and the time at which you left it?—I arrived in India at the beginning of 1856, and I left in 1865 finally, although I went back for two or three months in 1867.

7994. And how long were you in the Legislative Council; when did you enter it?—In the beginning of 1864.

7995. Then you were two years in the Legislative Council?—No, about a year.

7996. Did you go up the country at all; have you visited Gujerat?—Yes.

7997. What parts have you visited?—I have visited Gujerat, particularly Ahmedabad, also the Ahmednuggur and Poona Collectorates, and in the centre of the Bombay Presidency, Sholapore, and southward towards Dharwar, as well as other parts.

7998. Were those merely pleasure trips?—They were merely pleasure trips, although undertaken for the purpose of studying India.

7999. You saw something of the agriculture?—Yes, I did.

8000. You spoke of the benefit that there would be in taking off the export duties to the production of seeds; did you see any produce of seeds in your journeys?—Yes, a considerable amount.

8001. And you are aware that those districts that you visited export considerable quantities?—Yes.

8002. What particular seeds?—Linseed, rapeseed; in fact, the whole country where I was was one waving mass of seed and cotton.

8003. And do you think that if the export duty were taken off there would be a still greater cultivation of those seeds?—I do not say that, because I think that cultivation in the Bombay Presidency has very nearly gone to its extreme, though probably in other parts of India that is not the case. In the Central Provinces no doubt it can be extended, but I think that there is very little absolutely waste land in the Bombay Presidency, excepting in Kandeish.

8004. So that as far as Bombay itself is concerned, there would not be any great effect produced by taking off these duties?—Not in the

export of seeds from the Bombay Presidency, although there would be some.

8005. During the time that you were in the Legislative Council was this subject discussed much, were any changes made, and did the native members of the Council refer to the subject of altering the duties?—No, not at all; there were no changes made in the Customs during the time I was in the Legislative Council, and there was no discussion whatever upon the subject.

8006. During the time you were there the Customs rose very considerably, I observe?—Yes; because the trade increased enormously.

8007. And I suppose that the rise was principally in the import duties?—Yes; in the import duties.

8008. The rich natives in Bombay now, I suppose, consume great quantities of European goods?—Throughout the whole of India. The increase in the wealth of India, and especially of the Bombay Presidency, has been so great that people are able to spend a great deal more money than before. I do not know whether it would be of any interest to you to know the amount of bullion imported into India.

8009. Will you state that?—In the first place, I may say that the trade of Bombay is considerably larger than that of Calcutta.

8010. Mr. Dickinson.] Both export and import?—Both export and import. The trade fell off to a certain extent for a short time; at one time it was very much larger than that of Calcutta. But taking for instance, the years from 1867 to 1869, the returns of the Bengal and the Bombay import trade were respectively as follows: In 1867, the whole of Bengal 18,976,850 l. sterling, and Bombay 19,372,955 l.; in 1868, Bengal 21,840,163 l., and Bombay 20,476,046 l.; in 1869, Bengal 21,321,371 l., and Bombay 24,128,314 l. I have only been able to find comparative statistics for the first eight months of 1869-70 and 1870-71; but for that period in 1869-70 Bengal imported 13,151,107 l., and Bombay 15,442,602 l.; and in 1870-71, Bengal 13,424,844 l., and Bombay 17,161,720 l. In exports, the comparison is still more in favour of Bombay. Then as to the bullion imported in the 10 years from 1860 to 1869, by the Return to the House of Commons I find that 159,783,019 l. of silver and gold were imported into India and remained there, I mean after deducting re-export; and if we take a very imperfect addition, that is to say, Bombay for 1869-70, and eight months for Bengal only (I have not the other figures), I find that 181,372,964 l. were imported into India and not re-exported.

8011. Mr. Eastwick.] But to go back to the subject of these Customs' duties, did it not appear rather extraordinary to you that the native members of the Legislative Council did not refer at all to this question of customs?—No; for one very good reason, that there is no right of initiation of any measure in the Council, except in the hands of the Government; Government must initiate all measures for the Council, and when Government does not initiate, the Councillors have no right to make an observation. Besides, the Government of Bombay had no power to deal with that subject at all.

8012. Sir C. Wingfield.] But on the annual Budget statement, they have full liberty to treat on any subject, have they not?—In the Supreme Council of Calcutta no doubt they have; but I speak, of course, of the Bombay Council, and there is no Budget there. Now, under

the separate system, no doubt the Budget will be brought before the Council, but there was no Budget laid before the Councils of the Presidencies during my time.

8013. Mr. *Eastwick*.] You think that the fact that they could not initiate measures was the principal cause of the absence of reference to the subject by the native members of the Council?—I do not say that, but it was an absolute preventive, even had they wished to refer to it.

8014. Sir *C. Wingfield*.] Their tongues were not tied; they might utter any opinion, might they not?—They had nothing to utter opinions about. The subject never came before the Council. I do not mean to say that Government would not have been very glad to have had any suggestions; quite the contrary.

8015. Mr. *Eastwick*.] Do you think that the system of duties has any effect upon the coasting trade at all?—No doubt it hampers the coasting trade, as it does every other. I mentioned the one case of rice.

8016. But you could not give a case in the Bombay Presidency, could you?—No, I have not got the statistics. I have no doubt whatever that it could be given, but I cannot give it, I am sorry to say.

8017. Mr. *Candlish*.] I understood you to say that the wealth of the natives of India had rapidly increased within a very recent period?—Yes.

8018. To what do you attribute that increase?—To the great demand that arose some years ago, in the time of the cotton famine, for cotton. In the first place it began, I may say, with a great demand for oilseeds. During the Russian war that trade was enormously developed, and the cotton famine brought enormous sums of money into the country, which were, for the first time, I believe, equally shared with the ryots.

8019. So that the taxation now levied upon India will be relatively less oppressive than in previous years, because of the increased ability of the people to bear it?—Yes.

8020. You have been speaking of the Customs' taxes on imports; would you suggest any change which would effect an improvement in the assessing of those taxes, so as to make them less oppressive to the people, and as productive to the Government?—No.

8021. You would pull down the Custom House altogether?—I should think it desirable to do so, except for purposes of registration.

8022. Sir *C. Wingfield*.] I gather from the answers that you have given to some honourable Members that you think the assessment on the land in the Bombay Presidency too low?—Yes.

8023. On what ground do you arrive at that conclusion?—On the proportion which the assessment bears to the profits of the ryot.

8024. But have you seen those profits accurately stated?—It is very difficult to say that any such calculation is very accurate; but I could mention one or two circumstances by which you could judge for yourself. For instance, I know that in one talooka, which has just been reassessed, the Soopa talooka of Surat, the survey officer stated that the right of occupancy of land, subject to the condition of paying the Government land revenue, has been sold for 1,000 rupees an acre, and the maximum land tax there was 26 rupees upon the best land.

8025. Mr. *Eastwick*.] What sort of land was that?—It was first-class land; land capable of growing sugar cane and the best crops.

0.59.

8026. Sir *C. Wingfield*.] It was a piece of exceptional garden cultivation, probably?—I do not know that.

8027. It was not the average agricultural soil of the district, was it?—No doubt it was good land. One might make a calculation as to the total revenue; I believe that the land revenue of the Bombay Presidency is something like a twentieth of the gross value of the harvest.

8028. That increase of rental has resulted, perhaps, since the settlement?—Certainly.

8029. And is owing to the moderation of the Government demand?—Of course, naturally so.

8030. Therefore you do not necessarily imply by your answer that at the time the settlement was fixed it was unduly low, do you?—Well, I am not finding fault with the original assessment having been low, because it produced an immense increase of cultivation in the Bombay Presidency; I believe an increase of something like 50 per cent. in the 10 years from 1850-51 to 1860-61; but I say that in reassessing we may get a very much larger amount out of the land than we at the present time do.

8031. But the reassessment can only take place on the expiry of the present leases?—They are expiring every day, and a great many of them have expired now, and are reassessed.

8032. But have you reason to think that in the revised settlements the rate is fixed too low?—I think that is the tendency; I think in such a case as that of the Soopa Collectorate it is too low.

8033. I do not want to go into the question whether it is too low or not in that particular case; but you do not undertake to say that, as the revision of settlement takes place, the land assessment is fixed too low; therefore, if it is not fixed too low, if the State benefits by the increase of cultivation and rental, I do not see how you can calculate on getting an increased assessment on the land, specially to repay you for the abolition of Customs' duties; whatever increase you get, you will get in the ordinary course of the assessment; you cannot impose anything additional merely as a substitute for abolishing the Customs' duties, can you?—No, certainly not; but I think in the process of reassessment there will be a very considerable increase of revenue.

8034. That is altogether apart, and will follow necessarily without any advantage to the question of customs?—Quite so.

8035. I think you said in answer to the honourable Member for Stockport, that you set down all increase of revenue that has taken place in certain districts subject to canal irrigation to the use of the canal water; but are you aware that a great increase has taken place in certain districts which are destitute of canal irrigation?—Certainly; but I did not do exactly what you are supposing. I quoted the report of Colonel Baird Smith to show what had taken place, but I made the large and general remark, that all works of public improvement, not irrigation alone, but roads, canals, and railways, all tended to be reproductive.

8036. But at all events you set down that increase to the operation of public works of some kind?—I should, certainly, under the Bombay assessment system. You are aware that the rules by which an increase of assessment may be made in the holding of a ryot prohibit Government from charging an increase for any improvements

1871.

which the ryot himself makes; and it is only for public improvements, such as roads, canals, and railways, that Government is entitled to charge.

8037. I mean that, because in a district subject to canal irrigation, there has been a very great increase of rental, we are not necessarily to set all that increase down to the use of the canal water, inasmuch as an equally sensible increase has been found in many districts which have not got metal roads or canals at all?—Certainly, not all the increase; but I should doubt about the increase being an equal increase in places where there are no roads; if you specify *metal* roads, perhaps it may be so, but without some kind of roads I cannot see where the increase is to be got.

8038. You, perhaps, have not heard that the district in Upper India which has given the largest increase in the re-assessment, is a district that has not got 50 miles of metal road, or a single mile of canal in it?—I do not think that the whole of Guzerat has got 50 miles of real metal road, but there are other roads there.

8039. But without metal roads, and without canals, there may be as large an increase, may there not, as can be exhibited in districts which have both canals and railways?—I should very much doubt it.

8040. That is the case in Goruckpore, and so it may be said of the Province of Oude, throughout which the rise of rents has been enormous, and yet there is not a mile of canal in the whole province?—Yes, that may be possible; but there are roads, and the improvement in Oude is to be explained by a very good reason.

8041. I made the observation as going against the conclusion to which some people seem to be very ready to come, that whatever increase is to be found in the rental or revenue in India is owing to the great expenditure on public works. That is not the case, is it?—I think that to a large extent it is. I must say that I think that the illustration of Oude does not at all prove the contrary.

8042. You said that the condition of the population in Bombay had very much improved?—Yes.

8043. You refer, I suppose, to the agricultural population?—No, to the population generally.

8044. But how has the condition of the non-agricultural population been improved?—There has been a very much greater demand for labour and a general increase in wealth; at the same time I think that conveniences have been afforded to them which have not proportionately increased in the cost.

8045. Do you think that the rise in the price of labour has been equal to the rise in the price of food?—Yes, I do.

8046. But if it were only equal their condition would be much the same as it was?—It would; but still, on the whole, their condition is better.

8047. Mr. Eastwick.] Those views that you have expressed as to the immense increase in the value of the produce of the land are in accordance with the views of Mr. Knight, are they not?—I believe that I quite agree with him there.

8048. You are aware that he has written on the subject?—Yes; and I have heard him speak on the subject.

8049. Sir T. Bazley.] You have stated that since the American cotton famine there has been a great increase in the value of Indian cotton?—Yes.

8050. Could you form an estimate of the gross amount which has been paid to the Indian cultivator for the extra price of cotton since the commencement of that famine?—I am afraid not just now; but the sum is very large, and I believe that it was admitted at the time (I took a good deal of trouble to ascertain the fact) that a larger proportion of the profits of cotton was then paid to the ryot than had ever been paid before.

8051. You are, perhaps, aware that an estimate has been formed that the sum paid to India by Great Britain in the extra price of cotton exceeds one hundred million sterling?—I think that is very probable.

8052. Can you tell the Committee whether there is any visible improvement in the cultivation of cotton in consequence of the higher price paid as the result of the increased demand?—I think there is some improvement in the cultivation; but a much greater amount of improvement in the preparation and in the transport of cotton; I believe that it is in these points that the great improvement has taken place, particularly in the more rapid and cleanly transit of cotton.

8053. Do you think that the higher price received by the ryot stimulates him to improve its quality?—It certainly stimulates him, but the increased facilities of sending his cotton to market enables him to send it in a much better state. Formerly, before railways conveyed cotton, very little of the cotton of a year's crop left till after the monsoon; the consequence was that it was stored in the open air, exposed to the rain and the excessive damp, and the cotton became discoloured; then it was brought down on bullocks' backs, one bullock generally eating the cotton the whole of the way from the back of the bullock in front of him. The improvement which has taken place now in the packing of cotton, and the easy transit, has done more, I believe, to improve the quality of Indian cotton than anything else.

8054. Are you aware whether the manufacturers by machinery in Bombay select a better quality of cotton than is generally exported from India?—No, I do not know that they do so. They naturally select cotton which they consider suitable for themselves, but I do not know that they have got the pick of the cotton.

8055. Mr. Dickinson.] Are those cotton mills that you alluded to under European superintendence?—Many of them are. Most of them are owned by natives, but Europeans have a share in some of them.

8056. But as regards the working of them?—Generally, I believe, they are under some European supervision.

8057. And, therefore, an expensive supervision, I suppose?—Yes, comparatively.

8058. Are they large expensive buildings, like our own factories, or smaller?—They are not nearly so large as our own.

8059. How many storeys have they?—They are on the same principle as our own, but not very large.

8060. Did I rightly understand you to say that now, when there is a rise in the Customs, there is not also a rise in the price, because you mentioned that a telegram came down to Bombay to raise the Customs' duties on one occasion, and yet no rise took place after that in the price of the imported goods?—I am not prepared absolutely

Mr. W. R.
Cassels.

23 June
1871.

lutely to affirm that no rise did take place ultimately, but, at any rate, it was not perceptible at the time.

8061. Therefore the consumer was in no respect damaged by the increase in the duties?—The consumer was not, certainly, at that time. I know that my house had sold goods to arrive, the extra duty upon which amounted, if I remember right, to something like 5,000*l.*, and they had to lose that; that is to say, the persons who sent out the goods had to lose the amount; we could not recover it.

8062. I thought you said that the purchaser was bound to pay the difference in the duties?—Yes; but then they would not pay, and we could not make them; so we lost it.

8063. But the purchaser who ultimately bought was not effected; there was no rise of price corresponding to the rise of duty, as I understand you?—At that time there was not; and a great many sales were made on which there was probably no rise.

8064. Then your conclusion is, that the loss occasioned by the increase of the duties was on the importer and not on the consumer?—Yes, at that time it was.

8065. Can you say whether it has recovered itself, and the loss now falls on the consumer?—Theoretically it has done so of course, and I suppose practically.

8066. If the importer's profits were too high, or high enough to bear the duty, there might be no increase of demands, and therefore no increase of rise, I suppose?—That was not the case; the profits on piece goods are very small, I consider, as a general rule, and there was much competition.

8067. At that rate the duty must fall on the consumer?—It must fall on the consumer, of course, in the end; all duty does.

8068. Are there any local charges on landing goods in Bombay?—Yes.

8069. Are they heavy?—They are not very heavy, but they are charged at all the bunders.

8070. Are they arbitrary charges?—They are arbitrary up to a certain point; but there is a limit put to them by the competition for one thing.

8071. Are these private companies to which you are referring?—Private companies.

8072. Is there not a duty on every package, large or small?—Yes.

8073. Of a rupee, or half a rupee?—It varies according to the article, but generally on every package of bale goods there is a charge of one to four annas, if I remember right.

8074. Is that a private charge entirely?—That is the revenue of the company; it is a private charge, or a charge by Government according to the bunder.

8075. Are there no means of landing in Bombay except at private wharves, without paying that duty?—There are, but it is not easy, because the Custom House accommodation is very small.

8076. So that the trade of Bombay is in point of fact subject to that extra charge?—Yes, it is.

8077. And is there not also a great delay in landing goods?—Yes.

8078. Which also increases the charge?—Yes.

8079. What is the cause of that; what is it attributable to?—Insufficient Custom House accommodation.

0.59.

8080. Then, although paying high duties, you do not get sufficient accommodation for your trade?—No, we do not; and also, unfortunately, no ship can come alongside the wharves; all goods have to be landed in bunder boats; that causes very serious loss and expense.

8081. Loss by weather, do you mean?—Yes, and loss by time.

8082. Is it by the action of Government then that the wharves have been taken up by private companies to such an extent as to diminish the public accommodation for landing?—No; in fact the companies have been a source of convenience to the public rather than otherwise; of course they make the public pay for it; but at the same time, if it were not for these bunders still greater delay would take place.

8083. Are there bonded warehouses on these wharves?—Yes, on some; but I do not think that they are very much used.

8084. How is the duty taken?—All goods have to be declared, and they are examined, and the duties paid at the Custom House before the pass is given to take away the goods.

8085. Before the goods are taken from the ship to a private bunder?—They are never taken to a private bunder without the Customs' permission.

8086. Then does the examination take place on board or on the bills of lading?—No, it takes place on the bunder; a Customs' officer attends at all these bunders.

8087. Are there other local sources of Government revenue in the Bombay revenue which you can specify?—I suppose you do not refer to the municipal sources of revenue. That is not absolutely Government, but there is a contribution from the municipality for the police, that is to say, for the whole of the police of Bombay.

8088. That is raised by the municipality?—That is raised by municipality. Formerly the municipality did not pay that, but there was a Bombay Municipal Bill (I had charge of it during the time that I was in the Council), which threw the burden of the police of the town upon the town itself. The funds were to be raised by two per cent. upon house property.

8089. Are there no local sources of the Government revenue separate from the Imperial revenue?—The only one that I could name at all would be one that was mentioned the other day, the education cess, the one anna cess.

8090. That is in addition to the land revenue?—That is local decidedly, and not Imperial.

8091. By whom is it collected?—By the same officers who collect the land revenue.

8092. It goes in as a revenue charge and is repaid by Government to the municipality, I suppose?—It is not for the municipality. It is a charge made by the local government for education, in excess of the land assessment.

8093. It goes into the local treasury, and is collected by the collector, and appropriated by the local government to education?—Yes.

8094. That is scarcely a local revenue?—It does not go into the Imperial Treasury; it is not imposed by the Imperial Government.

8095. And it does not appear in these accounts before us then?—No, it does not.

8096. Have any of the other municipalities, besides Bombay, local sources of revenue?—Yes, I believe they have.

8097. From what sources are they derived?—If you mean the municipal taxes, it is the usual town

Mr. W. R. town taxation; house tax, lighting rate, and
Cassels. water rate.

23 June 8098. What is the source from which those
1871. rates are obtained?—From the occupiers of
houses, those who benefit by municipal arrange-
ments.

8099. Something like our own rates on real property?—Precisely the same.

8100. There is no special income of any other kind?—There is no special income of any other kind except what is derived from taxes of that description.

8101. You alluded, did you not, to some part of Kandeish where the value of land was 1,000 rupees an acre, as regards the ryots interested in it?—That was in Soopa talooka of Surat.

8102. And you said that on that the land revenue was 26 rupees an acre?—Yes.

8103. Are you quite sure of that?—Yes.

8104. Because 27. 12 s. is a large rental in that country, is it not?—Not for land of that kind; that is the very best kind. The average throughout the whole of Dharwar and Belgaum is, I believe, however, only 2 s. 3 d.

8105. Do you know the rate under the present new assessment; what is the share that the Government revenue bears to the supposed yearly rental of the land; is it 50 per cent.?—I think about 5 per cent., very little more than 5 per cent.

8106. I mean supposing that the ryot had the land free of land revenue, what would it let for?—I can tell you that, because Government took up some land for cotton experiments, and I think that the average price at which they rented it from the ryot was about 13 rupees an acre; and I think that the land tax upon that was 3 rupees.

8107. Then according to that, this land returning to the Government 26 rupees an acre, would have a rental of 20 times that, namely, 520 rupees an acre?—Very likely if they had taken it.

8108. Sir C. Wingfield.] You said that you considered the Government assessment was 5 per cent. of the produce?—Yes. In Sattara, Government have rented land, I believe, at 15 rupees an acre, and the assessment on that land is 3 rupees. I may say that the land is second quality land; all that I quote that for is simply to show that the value of land is high at the present time, and that the assessment is an extremely small rent for the ryot to pay.

8109. Mr. Cave.] What is the proportion that the Government take?—There is no set proportion, I believe.

8110. Mr. Dickinson.] You say that the Government rent the land at 15 rupees an acre?—Yes.

8111. Exclusive of the assessment itself?—The ryot pays the assessment.

8112. And on that the assessment was how much?—Three rupees; I am bound to say, of course, that when Government wishes to take up land it has sometimes to pay a little more than other people.

8113. Sir C. Wingfield.] And this land was taken for experimental farming, and therefore we may infer that it was choice land, I suppose?—It was second quality land.

8114. It was taken for experimental farming, was it not?—Yes; I merely mention that to show that the land assessment is very small on the ryot's land.

8115. Mr. Dickinson.] The account that you gave of the bullion, I suppose includes some bullion from China and Australia?—Very little; in reference to that, I may say that until very lately it has been quite impossible to get anything from Australia, because Australia had only gold, which was not a legal tender in Bombay. They had to send their gold round to England in order to pay for anything which they bought in India.

8116. That is altered now?—I hope it may be; there is a gold coinage introduced, but whether the system adopted will be effectual or not is a question.

8117. The tendency before that was for Australia to pay through England for any trade with India?—Yes.

8118. Mr. Candlish.] What was the fate of that Police Bill to which you referred, proposing to throw the police of Bombay on the municipality?—There was no special Police Bill; it formed a portion of the Municipal Bill, and it was introduced into that Bill in consequence of a resolution of the Government of India.

8119. Did it become law?—It became law.

8120. Did I rightly understand you to tell the Committee that Bombay now maintains its own police?—I was surprised to hear that there was a doubt upon that subject expressed here the other day; but certainly the Bill provides for the maintenance of its own police by Bombay, and allows, and in fact requires, the municipality to levy rates commencing at 2 per cent., and with the option of going up as high as 3 per cent., upon house property to pay for the police.

8121. You heard it stated, perhaps, that the Imperial revenue contributed largely to the police of Bombay?—Not to the town of Bombay itself; to the police of the Presidency, perhaps.

8122. The wharves and quays of Bombay are held in the same manner as the same property is held on the Thames, by private individuals, is it not?—Yes; by companies.

8123. As to your objection to the Customs' dues in India, is it that you have an objection to the Custom House duties in India merely, or that you have a general objection to a national revenue from Custom House dues?—Well, I have a general objection to Custom House duties, but more especially in India.

8124. What is the special objection to Custom House duties in India?—That it hampers a very large trade, with very little advantage to Government.

8125. Chairman.] Are there any further observations that you would like to make about the income tax, beyond those which you made when you answered one or two questions of the honourable Member for Worcestershire on that subject?—No, I think not. I think it is a tax that the natives very much object to, but I do not know that they do so with any reason.

8126. Mr. Bourke.] Can you tell the Committee what portion of the population of India the income tax at present affects, compared with the whole of the population?—I imagine a very small portion of the population.

8127. You do not know how many?—No, but those statistics must be in the possession of the India Office.

8128. Chairman.] The former income tax; the one that was so much complained of, I think, only struck one in 300?—Yes, something like that.

8129. Mr. Candlish.] Is there not an objection

tion to an income tax as a source of Imperial revenue from the evasion of true returns?—Yes, the natives complain more of the income tax (they have done so to me personally in the course of conversation) than of any other tax that they have in India; they consider that a large portion evade it, and do not pay a sufficient amount, and that consequently it falls unduly upon those who honestly pay their income tax.

8130. Have you any estimate of your own as to the extent to which it is evaded?—No.

8131. *Chairman.*] Of course you witnessed a very great rise of prices in Bombay in the time that you were there?—Enormous.

8132. Have you any observations with regard to that which you would like to make?—I think that within the last 10 or 15 years prices have very nearly doubled. There was a return made to Government by a Commission appointed to consider the subject of prices, which I think shows an enormous increase in the price of every article.

8133. And do you believe that the increase of price is going to continue, or that we have reached a period of lull?—I do not think that it will increase at the same ratio, certainly; but I should suppose that for the present, there is rather a lull, indeed a decline from the highest prices.

8134. *Mr. Cave.*] What is the amount of the increase?—I should say the increase must be in many cases very nearly 100 per cent.; but perhaps all round 50 per cent. The average from 1824 to 1859, for instance, up to 1863, showed an enormous increase. The mode of calculation in India, as you know, is so many pounds or seers to the rupee. For instance, Bajree, which forms one of the largest articles of consumption, was 94, as the maximum from 1824 to 1859, and only 27 in 1863; for the same price you got those relative quantities. Then Jowaree was 99, the maximum in 1824 to 1859; and 28 in 1863. That is an enormous rise of 75 per cent.

8135. You are stating quantities that you get for the same money?—Yes.

8136. Was not that caused by the rise in the price of cotton?—Partly so. It was caused by a variety of things; it was caused by the immense influx of bullion, by which money became depreciated.

8137. But for the purpose of purchasing cotton, was it not?—Not necessarily so; partly so, of course.

8138. Would it not be the case that those causes would be temporary, to some extent?—No, I do not think so. I think that the amount of money which has remained in India must have caused a great depreciation in its value.

8139. That which came in for the purchase of cotton and other articles, has remained in?—Yes.

8140. The exports from this country have not gone out to India in the same proportion, and therefore the money has remained in?—Yes; the exports from India have been largely in excess of the imports, and the balance has been paid in money.

8141. And the money has remained in the country?—Yes.

8142. And has not been spent in increasing the exports from this country to India?—No.

8143. Nor from any other?—No.

8144-5. *Mr. J. B. Smith.*] Have you reason to think that the rise in wages, and the price of food, is greater in Bombay than in other parts of India?—I think it is greater in both respects in Bombay.

8146. *Mr. Cave.*] Is not a great deal of that money which finds its way into India made into ornaments?—Yes.

8147. And that, of course, is withdrawn from the money market?—Yes.

8148. But not to such an extent as to affect it, I suppose?—Very considerably. India has always been nick-named the sink of bullion, but it is not so much so now as it was. I think that the ratio of expenditure is much greater now in India than it was; that there is not the same degree of hoarding.

8149. Artificial wants have sprung up, you mean?—Yes; artificial wants.

8150. *Mr. Beach.*] Has there been a tendency for the money to be absorbed by a few, or has it been spread over the country in general?—I think it has been spread over the country in general. Formerly the ryot shared to a very small extent in the money which came into the country; but during the great demand for cotton and seeds the ryot knew his power, and began to secure his fair share, and has continued to do so.

Mr. W. R. Cassels.

23 June
1871.

Mr. WILLIAM MAITLAND, called in; and Examined.

8151. *Chairman.*] You, like the last witness, were, I think, a merchant in India?—Yes, for about 14 years, in Calcutta.

8152. You also, I think, occupied some public position?—Yes, at different times I occupied these positions: I was President of the Bengal Chamber of Commerce; I was the first Chairman of the Landholders' and Commercial Association, one of the first two non-official mercantile members of the Legislative Council of Bengal, a Commissioner of the Income-tax; one of the Mercantile Commissioners to hear Appeals; and I was a Director of the Bank of Bengal.

8153. Are you still connected with India in commerce?—No; I have ceased to be a partner in the house; but I am so far connected with it that I have money in India, and interests in it, and am a director of two or three companies connected with India.

059.

8154. But you keep up your interest in India pretty closely, I think?—Yes, as closely as I can.

8155. Of course, as a merchant in Calcutta, the subject of the opium revenue was often brought before you in various ways?—Yes, very often; indeed my firm were agents for two of the largest houses in China, and bought opium very largely. I have been in China twice myself for about three months each time.

8156. And you have watched that trade for many years?—Yes.

8157. What conclusion did you form as to the probable future of our opium revenue?—The conclusions that I formed were, that the Indian opium revenue was never in any serious jeopardy until quite lately; but I think that within the last two years, in consequence of the increase which I believe has taken place in the quantity of opium produced in China, and of the improvement in the quality (which, I think, is exceedingly important),

Mr. W. Maitland.

Mr. W.
Maitland.

23 June
1871.

important), the Indian opium revenue is in greater danger than it has ever been before.

8158. And what course would you recommend the Government of India to adopt with regard to its opium revenue?—The course that I would recommend the Government of India to adopt would be exactly that which I should adopt myself if I, as a merchant, were in possession of the most lucrative and extensive monopoly in the world. If I found that monopoly interfered with I should send my own commissioner, or in some way endeavour to make every inquiry on the spot that I possibly could; and that very course, which seems to me a reasonable one, appears to have occurred naturally to the Board of Revenue in Bengal, because I see by the Opium Blue Book, that they call the attention of the Government of India more especially to information that has been received within the last two years, and to a letter received from Mr. Nussarwanjee, a Parsee merchant, a very respectable man, who had just returned from China. He wrote to the Government on the subject of opium cultivation, and sent samples of the China opium, which he brought back with him. The Board of Revenue submitted those samples to the examination of the opium examiner, who is a medical man, and the Blue Book gives his Report upon the subject, and he states that this China opium assimilated very much in quality, in strength, and in taste to the Indian opium, much more than anything that he had seen before. He had in his office some samples which were sent a few years back, and he contrasts the two, and arrives at the conclusion that the opium is very much better in quality than it ever was before, and assimilates much more nearly to the Indian opium than ever it did before. Upon that the Board of Revenue wrote to the Lieutenant Governor of Bengal, and suggested, and indeed urged, that they should send their own Commissioner to China to reside on the spot, and to get as much information as possible. The Lieutenant Governor sent in the Report of the Board of Revenue, and he recommended the adoption of this course, upon the strength of the advice received from those interested in the trade. The Government of India overruled that, and instead they advised sending to Sir Rutherford Alcock and other official parties in China, who got them information, which, to a certain extent, no doubt, is useful, but my own impression is, certainly, that their wisest course would be to send two or three men to China in behalf of the Government, to look into the matter themselves; probably two or three medical men, (they have always had very clever medical men in their service), or a man like Mr. Cooper, the traveller, if he would go. I think they might go and reside in China, much as Mr. Cooper did, not going as Government employés, but as merchants; and if they lived there for about a year, and saw the cultivation, and the process of manufacture, and in fact got every information which they possibly could; and then, supposing that there were two or three of them, if they did not communicate in any sort of way among themselves, but reported separately to the Government, the Government could see whether their reports tallied; and if they did, and they arrived at the conclusion that most people in China, I think, have arrived at, that there really is a danger that the cultivation is increasing, the quantity increasing, and the quality improving,

then it would be a very serious matter, and it would behove them to consider what they would do. If they arrived at that conclusion, I am very much inclined to think that their best course of all would be to get their revenue as they do in Bombay, that is to say, to throw the cultivation open; or else they must make up their minds to increase the quantity, and reduce the price, with a view of stamping out the competition by China opium. I think if they did so, that just in the same way as they are producing now 12,000,000 pounds of tea in India where they did not produce a pound a few years ago, the quantity of Indian opium would be increased, and the price brought down so much that they would be able to compete with the China opium, and get as much revenue from the duty of 600 rupees a chest, which is the duty on Malwa, as they do now.

8159. Do you think that it would be easy for the Indian Government to lay its hands upon people who had at once the requisite acquaintance with opium, and that knowledge of China, which would be necessary to enable them to make such researches as you have suggested?—I do not know that it would be easy; but they have generally had clever medical men in their service, and the opium question is a sort of medical matter, and the opium examiner is a medical man, and those men could do what Mr. Cooper did. Mr. Cooper travelled through a great part of China; and they ought to reside in China; but if they were to go as Government emissaries they would defeat their object. I think that they would be able as merchants to reside there quietly. Of course, they must have good men to do it; but I should think that good men might be found. It appears to me that the revenue of India hangs upon the opium revenue to a great extent, and that therefore any extent of trouble, and any reasonable amount of money would be well spent. I myself may just say that I practised what I preach; for in 1857 I went to China on a matter expressly connected with the rice trade. In those days there was a very great famine and high prices in China, and my firm were largely engaged in the rice trade; and I found it worth while to spend three months there in investigating the state of the trade, going from port to port, and getting information about the trade of Siam; and I think that what a private merchant found it worth his while to do in a matter of that kind, the Government of India might find it well worth their while to do in such an exceedingly important matter as this is.

8160. When we were considering the opium question, some inquiries were made with regard to the reason of the sudden rise in 1870; is that a question to which you have turned your attention?—Yes.

8161. Would you give us your views as to the causes of that sudden rise?—I think that what caused the larger receipt of about a million was of course the higher prices that they got; they got nearly 150 rupees a chest more, and the quantity produced was considerably more. Sir Richard Temple, in his last Budget speech, gave the quantity produced above his estimate as about 5,000 chests of Malwa, and said that the quantity of Bengal opium had increased; he did not say how much, but I believe it was 2,000 or 3,000 chests. The quantity increasing, and the price not falling, but rising, gave that amount in excess.

Of

Of course, if you ask how it was that the price did not fall in the face of an increased quantity, it is a little difficult to answer that, because all matters connected with China are difficult. But it appears to me that there are two or three reasons which are conjectural, and one reason which is certain; the certain reason is, that the exchange between India and China was very favourable indeed to shippers, the exchange had risen considerably. I have here a return of the exchange between Calcutta and China in the years 1869 and 1870, and the average in 1869 was about 217 rupees for the 100 dollars, and in 1870 it was 224 rupees. That represents very nearly a difference of 4 per cent; and 4 per cent. upon the value of the opium shipped on both sides of India to China would give a very large sum, I think; probably about 300,000/. The China opium trade has become of late more and more a bare trade, and it has got more and more out of the hands of the European houses into the hands of native firms, Parsees, Jews (some of whom are very rich), Marwarries, and others. The trade being such a very narrow one, any rise in the exchange or reduction of the rate of freight or cost of insurance, but particularly the rise in the rate of exchange, operates as a benefit to the seller; the buyers will generally bid up to as much as they can afford to give, with that very low margin of profit; and many of them have told me when I was in India, that if they could make a good rate of interest out of it they would be contented without further profit. In that way, I think, the Government get the benefit of almost any rise; and it is undoubted that the rate of exchange this year has been considerably more favourable to the shippers of opium than it was before. That is the certain cause. Then, I think, that there are two or three conjectural causes. One is that China has been more quiet on the coast of China and all the parts where the Indian opium is most consumed; the Taeping rebellion being put an end to, the country is more quiet generally, and there is a greater consumption of opium. Then, speaking as a merchant, I should generally say that when prices are low you may expect some reaction the following year, and that is why I am afraid that there may be some danger of an unfavourable re-action now; and then, if it be true that the production of China opium and the consumption had increased, as I believe they have, although eventually, I think, it will be very serious, yet for the time it may have increased the consumption of India opium by the Chinese, who could not afford at first, perhaps, to take the higher priced India opium. When once they began to use opium those who were rich enough may have gone to the higher-priced, finer-flavoured Indian opium, just as any of us might go to a superior class of wine as we were able to afford it. I think that those conjectural causes might, perhaps, account for it to some extent. I think that the rate of exchange certainly has helped the Government considerably.

8162. Now you have, of course, turned your attention very much to the tariff, and, I suppose, as well to the export as to the import duties; what have you to tell us about the export duties?—The only export duty that I think is objectionable is the rice duty. I think that the rice duty of 10s. a ton, which it is now, is very objectionable, because I am afraid that it may have the effect that the high duties that were placed upon saltpetre some years ago had. I

0.59.

was in India in Mr. Laing's days, when "the duty on saltpetre was raised to 10l. a ton; and I remember it especially, because there was a division of opinion among the merchants whether it could be safely done or not. It was thought by many, and I myself was one of them, that as that really was an article produced only in Bengal, it was one on which that could be safely done, and we gave that advice to Mr. Laing. I, and those who thought with me, were proved to be wrong. The production of artificial saltpetre in Germany and France increased greatly, the saltpetre trade of Bengal was injured, and the Government were obliged to give up the saltpetre duty altogether. It impressed itself on my recollection particularly, because I was wrong. I believe that the rice duties have mainly caused the loss to India of the whole of the rice trade with China and the rice trade with Japan, which has since sprung up. The whole of that trade appears to have gone to Saigon, in Cochin China, and to Bangkok, in Siam, which are free ports; there is no export duty there at all. I can give the Committee some information, in the shape of mercantile circulars from Saigon and from Hong Kong upon the subject. I have the Saigon Market Reports of Messrs. Hale & Co., of 10th March 1871, and the Hong Kong Circulars of Messrs. A. Heard & Co., of 7th and 21st February, and 7th March. I have also the memorial upon the subject of the rice duties which was presented to the Duke of Argyll, and the speech and statement of opinions of the present president of the Chamber of Commerce, Mr. Bullen Smith, who is a member of the Legislative Council of the Governor General. He, on the occasion of the last Indian Budget debate last March, in Calcutta, entered into this question of the rice duties very fully, and gave his opinion about it, and I quite coincide with him. And I am satisfied that these duties are calculated to interfere very seriously with the trade in rice to China and to Japan; and they are beginning also to interfere with the trade which used to be entirely from Bengal, the trade in rice to the Mauritius and to Ceylon, and also to Australia a little. I have looked at the shipping lists from these three places, and I find there, ships arrive with cargoes of rice from Saigon more particularly, when, to my own knowledge, we in Bengal had the monopoly of those trades at one time; and all the rice exported to the Mauritius and Ceylon, and almost the whole to Australia, went from Calcutta. That is beginning to be interfered with by the rice from Siam and from Cochin China; and I am afraid that it may go on, and then if the Government want to remove the duty of 10s. a ton, they may find it perhaps rather late to do so.

8163. But would you agree with the last witness in advising the Government of India to sweep away all import and all export duties together?—I do not think that the Government of India can afford it. I agree with the last witness that, as a general thing, customs duties interfere with commerce, and are, so far, not desirable. I wish there were no such thing as a custom house in the world; but I do not see how that can be done in India, unless there were some other thing to supply their place; and holding the view I do about the opium revenue being in danger, I could not agree with the last witness in that; but I wish that it could be done.

1871.

Mr. W.
Maitland.
—
23 June
1871.

8164. With regard to the income tax, of course, you have formed an opinion upon that also?—Yes, I have formed an opinion upon that, more particularly from having been for a time a Commissioner to hear appeals; and my opinion is (I am in the minority upon that point; it is an unpopular opinion) that an income tax is essentially just, and that a 2 per cent. income tax would hardly have occasioned much difficulty in India, if things had remained in India as they were; but when the income tax was raised, as it was, to 3½ per cent., and when you take the fact that there was very little made in India of late, of course it was felt to be heavy; and unfortunately in India those who had fixed incomes have felt the pressure of the increased prices in everything; and those who have not fixed incomes, merchants and planters, and so on, in the last few years have made very little indeed. The inquisitorial nature of the tax is more or less objected to; but I myself think that the income tax is so essentially just, and that it is so difficult to get any fair proportion from the rich classes of India without it, or without a succession tax, that I should rather see it retained myself, supposing it were at 2 per cent.

8165. You have alluded to succession duties; but are there not very great and very special difficulties in the way of succession duties in India?—I suppose there would be more difficulty than there would be in the case of succession duties in England. I know it is said that there are; and it is not a subject that I am so well acquainted with as commercial matters; but still I can hardly see myself the very great difficulties that there would be. There would be some difficulty; it would be, of course, a tax something of the same nature as the income tax, more or less inquisitorial.

8166. Do you happen to have read a paper by Sir Henry Maine on that subject?—No.

8167. With regard to the salt revenue, I think you have heard a good deal of the evidence we have had about that?—I think I have heard or read pretty nearly the whole of it.

8168. What view do you take of it?—The salt revenue, I should look upon something in this way. If I think that the rich ought to contribute in the shape of an income tax, and if it is admitted that all parties ought to support the Government under which they flourish, I do not see how you can very well get anything from the poorer natives of India, cultivators and so on, except from something in the nature of a salt duty, or a tobacco duty, or a poll tax. I look upon the salt duty as virtually a poll tax; I should look upon the salt tax as something in the nature of a commutation of a tobacco and a poll tax; in fact, the contribution of the poorer natives of India to the support of the Government. I think, that the question is, whether the natives can afford the present rate, and whether or not they have increased so much in prosperity during the last few years as to be able to support it more easily. I have no doubt that their prosperity has increased, and I should have thought that they were in a position to pay the tax without much difficulty.

8169. It has sometimes been tried to create an impression against the salt tax, by pointing out that the tax is enormously disproportionate to the actual price at which the commodity could be sold without the tax; but that is a very fallacious

way of regarding the matter, is it not?—Yes, in my opinion it is a fallacious way. I do not think that that is the question whether the tax is 10 times or 20 times the amount at which the salt can be produced. The question is, can the people afford to pay it and if they can afford to pay it, is there any better tax. I cannot see any better tax than that, or a tobacco duty, or a poll tax for the poorer natives of India. They use so little in the shape of clothes and pay so little to the Government in the way of import duties that it is the only duty they pay, and I can hardly see how they can help to support the Government in any other way. I do not think that the argument, which you refer to will hold water, myself.

8170. The whole price of the article, the price at which it has been produced and the tax added to it, is very small?—Yes; at all events, not large. By the time it comes into the hands of the consumer, I imagine that it costs a good deal more. I saw a gentleman the other day who returned lately from Assam, and he mentioned the price at which the salt was selling up there.

8171. You have never, in all your experience, had any case of real hardship connected with the salt tax brought before you?—No; but I should not be likely perhaps, as a merchant, to hear much about it.

8172. I think, also, you have given a good deal of attention to the tea cultivation in India, and to the general utilisation of our waste lands?—Yes.

8173. Do you think that we may look forward to great advantages from that cultivation in the future, and from other treatment of our waste lands?—Yes, I do. I was in India at the time when there was very little tea produced. I was one of the Calcutta directors of the Assam Tea Company, and my firm was one of the first who began the tea cultivation. The tea cultivation has passed through a period of great depression, but it has revived lately. The production last year was 12,000,000 lbs., and the estimate for this year is 16,000,000 lbs. There has been such an improvement in the price of what they call "tea stock," and in the position of many of the companies, that I think, in all probability, there will be a considerably increased production if the present prices continue, which I think they will, because the tea produced in India is a mere drop in the ocean as compared with that produced in China; the quality is good, and it is much liked.

8174. Mr. J. B. Smith.] The import of tea from China is about 120,000,000 lbs.—Yes.

8175. [Chairman.] In order to increase the cultivation of tea and similar products, what policy would you recommend with regard to waste lands?—I think that the policy of Lord Canning's waste land rules was a wise one, though it has been spoken against. I was in India at that time. Under that the Government proposed to sell waste lands for 2½ rupees, or 5 s. an acre. I think that that was a wise policy; there were considerable difficulties thrown in the way, but I think if the policy contained in those rules were mainly acted upon, that would be a wise course. I am quite aware that it is said that selling the land at so low a price injures the Government; that they will not have the land to fall back upon hereafter; but I think it should be considered that every tea planter who farms a plantation,

a plantation, adds one to the garrison of India, looking at it in that point of view, and adds to the productive powers of India; those about him would use imported articles, and in various ways benefit the country; and although it may seem impolitic to sell for 5 s. an acre, in the long run it may prove beneficial.

8176. Do you think that the Looshai disturbances have had any serious effect on the tea cultivation?—No, they did not affect Assam, the part I know most of. There has been a certain amount of dissatisfaction; it was said that the Government did not protect the planters sufficiently, and to that extent they may have caused alarm.

8177. Do you think that in the Kangra Valley, in the north-west, the tea cultivation has a great future?—Yes.

8178. Even more than in Assam?—Yes, even more than in Assam, because I think it is on the cards that they may be able to establish communication with Central Asia, and sell tea in that way, besides sending it to England.

8179. There is a great demand for tea in Central Asia, is there not?—Yes.

8180. Do you, yourself, think that the trade from the north-west frontier into Central Asia, will ever be of much importance to our commerce; I mean the road by the route from the Punjab into the centre of Asia?—I think that it will be important; I do not know that it will be very considerable for a long time. I think that sooner or later it will be of importance. I think that the other communication with China and Thibet, which Mr. Cooper endeavoured to find, would be very important. If he is correct (and he is very strong about it) in his opinion, the Thibet people would take our tea and they could afford to give our planters a very good price, because they give the Chinese now a good price, and we in Assam, if we once opened a communication, should be much nearer to the place of consumption than the Chinese are.

8181. Is it within your knowledge that the Government of late has shown itself anxious to reopen the friendly communications with Thibet which existed in the days of Warren Hastings?—Yes.

8182. Mr. Cave.] Why should not the Government lease the land to the tea planters instead of selling it at so low a price as you have mentioned?—Because I think that every man prefers having land in fee simple if he can get it.

8183. But the price of 5 s. an acre of course is absurdly small; if the Government were to consider that it was better to retain the land in their own hands, would that have any effect in deterring people from tea cultivation?—I know Ceylon very well, and the Government have sold their land there for many years past outright. The rate there is 1 l. an acre, I think, now, and it may be that planters in India would be willing to give as much as they do in Ceylon, 1 l. an acre. If the Government thought that 5 s. was too low, it should go for a higher price; but think as a general rule, if I were in India, I would rather have my land my own in fee simple than rent it.

8184. You would probably give a much higher price than 5 s. an acre rather than rent it?—Yes.

8185. You stated that the tea planters formed a sort of garrison for India; but is it not rather the fact that they are a source of weakness at

present, from inhabiting outlying districts near the frontier; they invite aggression, do they not?—They do to a certain extent; but I think that every man who makes a settlement in India supplies a force; I mean in case of such a thing as another mutiny in India. It was found in India, at the time of the Mutiny, that not only the Government servants but men engaged as planters were of considerable use, and I think that they would be again if ever such a circumstance as that should occur again. I speak of Europeans going and settling in such a district as the Kangra Valley.

8186. The Assam tea is a high-priced tea, is it not?—Yes.

8187. And I suppose, to compete in the market at all with China you must produce a much lower-priced tea, must you not?—No; the Indian tea generally is of such a very good quality and so strong, that it is used to a great extent to mix with and to strengthen the China tea; the Indian tea is the strongest of the two.

8188. Would it not be possible to increase the supply of tea to such an extent, that there would be too much for the demand?—Not for a very long time to come, because the importation of China tea is 120,000,000 lbs., and the importation of Indian tea is only 12,000,000 lbs. I think it is a possibility that some day or another India may supply England with the whole of the tea she wants.

8189. If so, you would be obliged to sell it at a very much lower price than you do now, would you not?—No, not very much lower, I think; perhaps a little lower.

8190. Is it not the case that the present price of Assam tea renders it quite beyond the power of the lower classes to consume it?—I do not know; perhaps it is not within the reach of the lowest classes. I on one occasion advised some poor people to try it, and they did so, and they were very much pleased with it; and there were some shops open, I do not know whether they are still open, in neighbourhoods where the tea was likely to be bought by poor people. They sell it in the shops at 2 s. 6 d. a pound.

8191. You think that its additional strength makes it more economical for use than the lower-priced tea?—They mix it with the China tea to strengthen it.

8192. The tea companies have not been very successful generally, have they, in India?—The tea companies for a time were very unsuccessful indeed, but I think that they have taken a turn. As to the Assam Company, which I mentioned, their shares only a little while ago were 170 rupees a share, and they are now 300 rupees; and I know companies where the shares have doubled, trebled, and even quadrupled, within the last two years.

8193. Sir C. Wingfield.] But they were down very low before?—Yes; they have not doubled upon the par value, of course. But the Assam shares at 300 rupees are 50 per cent. premium, because there are only 200 paid, and those shares were only 170 a year or two ago.

8194. Mr. Cave.] Is there a large population in the tea districts?—Not a large population. When my firm opened an estate, we cultivated by local labour. Since that, as you are aware, a good deal of labour from other parts of India has gone to Assam, and now I believe it is considerable.

3 C

8195. There

Mr. W.
Maitland.
—
23 June
1871.

Mr. H.
Maitland.
—
23 June
1871.

8195. There has been a regular import of coolies, as there has been to the West Indies, has there not?—Yes.

8196. Have those people settled there permanently?—They have settled there. There is a very favourable feature connected with them, that the planters have been able to make re-engagements with them, as the time expired, with very much greater facility than before, and there seems to be a local population of these imported coolies.

8197. Do they come with their families?—Their families are, I believe, beginning to come to them to some extent.

8198. At first it was merely a migration of people who went back after a certain time, was it not?—Yes.

8199. I did not quite understand how you proposed, with regard to opium, to counteract the danger of a fall in the revenue?—What I said in regard to opium was this, that if there was the danger from the cultivation in China which I expected. I thought the first thing was for the Government to find out whether that was the case or not; and if they found out that it was, they would have either to continue the manufacture and reduce the price, or else to do what has often been suggested, throw it open to private enterprise, and get a duty just in the same way as they do from Malwa opium; they get 600 rupees a chest from Malwa opium; and I think that according to the figures of the opium revenue and expenditure for 1870–71, although the prices which they got showed a considerable increase, if Sir Richard Temple's estimate of 975 rupees a chest only had been realised, it would be found that the Government would have not made more by the manufacture of opium in Bengal than by the duty which they get from the Malwa opium, without any trouble or difficulty at all. Many people think that if the cultivation were thrown open, there would be such an increase in the quantity that the Government would get, from the duty of 60% a chest, as large a revenue as they get now or larger.

8200. If all depends upon whether it can be grown as cheaply in India as in China, taking into consideration the transit, of course?—Yes.

8201. Have you formed any opinion upon that?—I should think that with the fertile soil, the favourable climate, the abundant supply of labour, and the experience that has been gained in the manufacture, and plenty of money, India ought to be able to hold her own in growing opium against any part of the world except China; but in China they are growing opium for their own consumption at their own doors. Every chest of opium that goes to China from Calcutta, for instance, pays about 25 rupees a chest for freight, and then there is the insurance, and charges of one kind and another, to get it to the sea coast, and then to send it up into the interior, so that by the time that it arrives at the place of consumption, there is a considerable amount of charge added. The correspondence in that Blue Book containing the Report of the Shanghai Chamber of Commerce, which was very highly spoken of by Sir Rutherford Alcock, gives the rate at which Indian opium and China opium are selling at different places. The report which was given by the opium examiner for the Government shows that the sample, if it was a correct sample, of China opium, sent in by Mr. Nussarwanjee,

was very much improved in quality, and very much more assimilated than the Bengal opium, than the samples he had seen before, which were very inferior. I think that that question of the quality is as important as the question of the quantity.

8202. Malwa opium is far superior, is it not?—No; it is very good, but I think that Patna is almost the best.

8203. Besides those charges which you have mentioned, you have to add the charge of taking the opium down to Calcutta from the place of growth, and then the duty?—Yes.

8204. So that it is enormously weighted by the time it gets to China?—The expense of sending it down to Calcutta is not much, but the expense of sending it to China, and the duty you pay there, and the squeezes which the mandarin takes, by the time it gets to the hands of the consumer, considerably weight it.

8205. You think that there is considerable danger that the Chinese may drive us out of the market?—I think that all the evidence which has been given before this Committee seems to go that way, and all that I have ever heard and seen on the subject makes me think that that is the danger. I am not afraid of Turkey, or Persia, nor any opium, except the China opium.

8206. I do not see how your proposal to throw open the opium growth and manufacture would prevent that, because you simply change the form of account, and you charge what is now charged by the Government for the cost of manufacture to the item of duty; you do not reduce the expenditure upon opium in India by throwing open the manufacture and growth, do you?—At present, as shown by the result of the last year's opium, the Government have got a profit by the duty, and also the profit of the manufacturer; they have got more than the 80% a chest. I think that private cultivation could bring down the price in case of need; in fact, that private people could manufacture opium cheaper than the Government could, just as they manufactured indigo cheaper than the Government could do years ago.

8207. There would be a saving, no doubt, if that is so; but would there be sufficient to enable them to compete with the Chinese at their own doors; that is the question, is it not?—That is the question; but I think the public can produce more cheaply than the Government can; they would be more likely to do so. Of course, in case of need, the Government would have to reduce their duty. The duty upon Malwa opium has not always been 600 rupees; it has varied; and the Government, rather than lose 60% a chest, would have to take less.

8208. But the whole sum of your opinion is this, that there is a margin which could be obtained by the greater economy of private cultivation than Government cultivation, which would put off the evil day?—I think that the Government themselves could produce opium cheaper, if they wanted to do so, and in a larger quantity; but I think in all probability private cultivation would produce it cheaper still.

8209. When you say that the Government could produce it cheaper, do you mean that there is extravagance in the present management?—I think that the Government could reduce the rate that they pay to the ryot. I was told so by a gentleman only the other day, who had been connected

needed at one time with the opium department in India; at Patna, I think it was.

8210. You mean that the cost of the rent of the land might be reduced?—The Government take it from the producers and pay a certain rate; I think that the producers could produce it at a lower rate, and yet make a profit.

8211. If the Government were to lower the rate to the ryots, they would be enabled, by more economical management, to make the same profit themselves, you think?—Yes; but I do not think that the Government will ever manage so economically as private persons would.

8212. Sir C. Wingfield.] You were giving just now Lord Canning's rules for the sale of waste lands at 5s. an acre; has not the result been that many of the tea companies and individuals bought a great deal more land in Assam and in those parts than they could pay for, and that latterly they have been obliged to ask the Government to take back the land and forgive them the payment?—I do not know whether tea companies have done so; individuals have done so, I know. As I have said, the tea cultivation went through a period of very great depression indeed. Very soon after those rules came into operation large tracts of land were taken up; in many cases people took more than was wise.

8213. Owing to the cheap price, people took a great deal more than they could pay for?—Yes.

8214. And that has been found not only in Assam, but also in other parts of India, that a great deal of land has been thrown back into the hands of Government?—Yes.

8215. Immoderate expectations were raised as to some of the advantages to be derived from purchasing waste lands?—Yes.

8216. What objection did you see to the modification of the rules that required all waste lands to be sold by auction?—The objection that I saw to that was this, that we found practically that when it was put up to sale by auction, a number of mock buyers came forward, in some cases Europeans, in more cases natives. There were a number of cases where the natives, in order to please the Government, bid in the auction sales, and when it was knocked down to them they could not complete the bargain, and they were let off. And there was another objection not connected with the auction sales. We found that the Government not surveying the land and selling it in plots as it is in other parts of the world, the moment that a man applied for a survey, who was supposed to understand what he was about, and to be an experienced man, other people would go competing for the land which he was known to be after. I myself have had to write up to our agent, not to make any inquiries, or apply in his own name, because he was known to be an experienced man.

8217. But then the Government should have done in Bengal what it did in other parts of India, and that was to make a survey of the waste lands, and then mark them into allotments itself, and then put them up for sale?—That would have been the proper plan, do doubt.

8218. You said that you thought the future tea cultivation in the Kangra Valley as great, or greater, than in Assam?—Yes.

8219. But it is not the case that the yield of a tea plantation per acre is far less in the colder climate of Kangra than it is in the moist damp climate of Assam?—No, I do not think it is materially so, and quality is exceedingly good.

0.59.

8220. But have you not always heard it said that the yield is very much larger than in Assam?—No, I do not think so. I think that there is a great future for Darjeeling. I believe that Darjeeling is producing tea now to a very great extent.

8221. You think that in Assam, having passed through a period of depression, it is now likely to flourish?—I think so.

8222. And what limit to the extension of the cultivation do you see at present; is the want of labour the only limit at present?—The want of labour was one great difficulty when first the tea cultivation took a great start. I was in the Legislative Council of Bengal at that time; there was no end of pains taken to regulate the transport of the coolies and to take care of them, and so on, and it was very difficult and very expensive; a great many of them ran away, and others would not re-engage at the end of the term.

8223. Do you think that the failure of so many companies and the terrible depression of the tea enterprise for some time was owing mainly to the companies and individuals having in the first instance brought a great deal more land into cultivation than they could find labour properly to superintend and keep in order, and also to the extreme ignorance and inexperience of many of the people employed as managers?—I think that it was owing in a great measure to the last cause that you have mentioned. I know myself persons who had great difficulty in finding superintendents, and who got all sorts of people who knew nothing about it. There are tea companies that are now producing tea of good quality that were not producing it two years ago. I know cases where the same company, under a man who understands the management better, is producing very much better tea, and making a profit instead of a loss.

8224. But do not you think that bringing more land under tea cultivation than they could keep in order was one cause of the depression?—That had something to do with it.

8225. A great many of these companies had to give up land that they had planted, if I remember right, and reduce their area of plant?—Some of the companies collapsed altogether.

8226. But do you think that now there is no apparent obstacle in the way of a very considerable extension?—No, I do not see any obstacle if labour continues to go to those districts, and if the population increases from natural causes, which I think it is doing to some extent; I do not think that there is any great difficulty except labour.

8227. Do you consider tea cultivation to be more dependent on the vicissitudes of weather than any other cultivation?—No, not nearly so much as indigo cultivation.

8228. Mr. Brach.] There is this objection to accumulating waste land in fee simple, is there not, that the land revenue being the principal source of revenue in India, there would be no prospect of obtaining any revenue from that land for the future?—I am speaking of sales of waste land which never did give any revenue to the Government at all.

8229. They have never given any; but if a sufficiently long lease was given, there would be revenue to be obtained in future, would there not?—Yes; but I do not think that people will take land on lease on the same terms as those on

which they will buy the fee simple. At the time that Lord Canning's waste land rules came out, there was a provision under which persons could redeem the land tax. That was soon repealed, and very little was done under it; but I am speaking of waste land that never produced anything to the Government at all.

8230. Was that only for the purposes of tea cultivation?—For other purposes as well, but I think mainly for the tea cultivation.

8231. Are the expenses connected with tea cultivation so great that a long lease would not be sufficient to induce anybody to undertake it?—No; I think that a long lease would probably induce people if better terms could not be had; but I think that they would be certainly more attracted by being able to buy the land outright. The coffee cultivation in Ceylon is carried on under that system.

8232. But nearly all our evidence hitherto has gone to this fact, that a 30 years' lease has been sufficient for ordinary purposes to induce anyone to take land and to give him an interest in the cultivation; is not that so?—Yes; but I think that that applies more to lands that were already in cultivation. A 30 years' lease seems to be given generally in Bombay, and not a permanent settlement; but I think that that applies more to cultivated lands than to waste lands.

8233. Sir C. Wingfield.] Do not some of the old tea companies hold their land on lease; they began their enterprise before the sale of waste lands was allowed, did they not?—Yes; they did.

8234. Mr. Beach.] With regard to the cultivation of the poppy, I thought that cultivators undertook the produce of the poppy, and advances were made by the Government?—Yes; so they do.

8235. The Government do not actually cultivate it themselves; they make advances to other people to cultivate it?—Yes; they make advances to other people to cultivate it, and then take the produce, at a certain fixed price, into their own factories, and there the manufacture is completed. I believe that what the ryots deliver to the Government is the opium in a very rough state, and the manufacture is finished in the factories.

8236. The Government do not undertake the sale themselves in Calcutta, but it is entrusted to an auctioneering firm, is it not?—No; that used to be the case, but latterly the Government, for the sake of saving expense, sell it themselves, I believe.

8237. They sell it by auction?—Yes, just in the same way as before, only that they sell it themselves, instead of an auctioneer selling it.

8238. With regard to the income tax, would you kindly inform me on what portion of the population the income tax chiefly falls?—I cannot tell you that.

8239. Chiefly in the towns, I presume?—Yes.

8240. Chiefly on those who do not pay, for instance, the land tax?—Yes; I think it would fall chiefly upon towns, but it would fall also on those who pay the land tax, if they paid a sufficiently large amount.

8241. But, in your opinion, if the income tax was at a low rate, such as 2 per cent., it is not an unfair mode of levying taxation?—No. When I was in India the rate was about 2 per cent., and then India was more prosperous than it has been lately; people were doing better and

I did not hear much complaint; but a great deal of complaint has arisen since. One of the reasons, I think, is, that persons are not so well off, and that they feel the pinch more than they otherwise would do; and the rate having been increased, it falls very heavily upon them.

8242. Is it necessary to make the tax such a very inquisitorial one; cannot the income be taken in many cases at its source?—It can be so taken, in the case of payments of salaries and interest on Government paper; and on all payments of that sort, the income tax is taken in that way just in the same way as a bank in London deducts the income tax. All the income tax on Government paper is deducted when the interest is payable.

8243. Mr. Dickinson.] You speak of the Assam plantations as being in unhealthy parts of the country?—Assam is not so healthy as other parts.

8244. Do you consider any part of Assam calculated for a European settlement?—Not for a European settlement in the same sense that Darjeeling would be, undoubtedly; but I think that there are numbers of planters there, and the numbers will be increased, although it is not so healthy as other parts.

8245. I do not mean planters living there for a time, but coming and bringing their families there?—No, I do not think they could.

8246. Then in that case it would not be one of the advanced posts that you spoke of?—No, but it would be so at Darjeeling, and it would be in the Kangra Valley, and all about there.

8247. Is not the price of Indian tea very much affected by the mode of packing and transit; is not the packing very expensive?—Of course the price is affected by the expense of transit.

8248. In the packing, I think, lead is used?—Yes, lead is used in packing, just as it is in China.

8249. I understood that the packages of the India tea companies were really very expensive packages; the lead and the wood packages?—The wood packages are not very expensive; they are rather dear to buy, but there have been complaints sometimes that they are not so good as the China packages.

8250. Would not the capital involved in purchasing the land be more profitably employed as speculation, in being applied to the tea planting itself?—Of course if you could buy at a very low rate, the capital involved in the purchase of land would come to very little.

8251. Still would not the capital be better employed, as a rule, in the cultivation itself, than in the purchase of land?—No; 5s. an acre, I think, is so little that it would hardly be considered, and even at 1l. an acre, I think it would be better to buy outright. That is the result of the experience in Ceylon. The land there cultivated with coffee is land which has been bought from the Government in fee simple.

8252. Another system has not been tried there, that of giving long leases?—No; but as a general rule all over the world, I think you find that people, if they can buy land outright, very much prefer doing so, even though they do sink the capital in the price they pay for the land.

8253. Mr. J. B. Smith.] I think you stated that you have a great objection to the export duty on rice?—Yes.

8254. Would not the same objection apply in principle to all duties on the export of produce?—

Yes.

Yes. My objection to the export duty on rice is just this: that rice can be produced, and is produced to a large extent in other countries where the export is free. That is my objection to it. If there is any article of Indian produce which competes with that of other countries, and if it is heavily taxed, I think the same objection would apply to it. I do not think that if you look over the tariff there is any export duty on anything except rice that I conceive is objectionable.

8255. Is not the effect of the duty upon the export of rice to give a bounty to the producers of rice in other countries?—Yes.

8256. And therefore it must be objectionable, and an injustice to the producer or cultivator of rice in India?—Yes, I think so.

8257. What is about the average price of rice in India?—I suppose that it can be put on board at about 5*l.* or 6*l.* a ton.

8258. And what is the revenue that is produced?—The revenue I think is about a quarter of a million from all parts of India. The export duty, at 10*s.* a ton, I think will be found to be equal to that.

8259. And you have reason to think that already they are beginning to feel the effects of that duty in foreign competition?—Yes; and I can put in mercantile circulars from China, and from Saigon, which state that, in consequence of there being a great demand for rice in China, 25,000 tons of shipping had just gone down to Saigon and Bangkok. In my time there used to be a very large trade in rice between Calcutta and China, and I think that that has all been diverted; of course, Siam and Cochin China, being nearer to China, have the advantage already; and then the Bengal and Burmese rice is further weighted with this extra duty.

8260. There was formerly a duty on the export of saltpetre from India, was there not?—There was formerly a duty on the export of saltpetre which was doubled in the time of Mr. Laing, and injured the trade.

8261. The effect of that duty was to destroy the export, was it not?—It did not destroy it, because there is an export still; but it destroyed the duty, because it gave such a stimulus to the production of artificial saltpetre in France and Germany that the Government found that they were obliged to reduce the duty, and finally to give it up altogether.

8262. They have given up the duty after having ruined the trade?—I will not say that they have ruined the trade, but they have injured it.

8263. Is the export now equal to what it was?—No.

8264. Then, in fact, the Government have done something towards ruining the trade without benefitting the revenue?—Yes.

8265. And you fear that a similar result may occur with regard to rice?—Yes; because India having lost the whole of that trade to China, I am afraid the same thing is taking place with the trade to Mauritius and to Ceylon.

8266. Sir *T. Bazley*.] You have told us that, in your opinion, the opium and the tea may be almost infinitely extended?—I think tea may be, and opium may be considerably extended. Opium requires good soil, and could not be extended to the same extent as tea, I suppose; but still I apprehend that it could be considerably extended in India if necessary.

Q.59.

8267. And do you think that there are the same facilities for extending the cultivation of rice, flax, cotton, and sugar?—Of rice certainly. Flax can be produced. There is not much sugar produced in India now compared with what there used to be; not for export to Europe. The production could be extended, but there is not so much demand for Indian sugar for Europe as there used to be; Indian sugar is more used in India itself. I remember the time when we never used to send any sugar from Bengal to Bombay; now there is a large export of it from Bengal to Bombay.

8268. Are you acquainted with the means of extending the cultivation of cotton?—No, I am not practically acquainted with it; but I know that great pains have been bestowed by many people upon the cultivation of cotton, and I am glad to see that the Government have just established a Board of Agriculture.

8269. Can you tell me whether you think the agricultural or the manufacturing resources predominate in India?—I think the agricultural.

8270. Mr. *Lyttelton*.] Is it the case that no land revenue at all is raised from the tea plantation in the Lower Provinces?—No. I think that generally the tea plantations are held in fee simple, that the Government get nothing from them.

8271. What was the land before it was sold as waste?—Forest land, a great deal of it.

8272. And can you state roughly what the value per acre of a flourishing tea plantation is at present?—No, I cannot tell you that very well.

8273. It is of considerable value, is it not?—Yes, of considerable value; but then, of course, there has been a very heavy expense incurred in buildings and importing labour, and so on; that is the greatest part of the expense, and wages, of course.

8274. Compared with opium, is it anything like as valuable as opium land?—No, I should think not.

8275. But it is more valuable, is it not, even taking into consideration the outlay that has been bestowed upon it, than a great deal of land in India that does pay land revenue?—Yes; it is more valuable with the outlay that has been made upon it.

8276. Mr. *McCune*.] Do the tea plantations require manure?—There is the expense of clearing the land, if it is forest land, and the wages, and the pay of the European superintendence, which is, of course, very heavy; and they are beginning now to use manure; and then there is the cost of the boxes, and the expense of sending it down.

8277. Mr. *Lyttelton*.] What sort of land is regarded as suitable for tea cultivation?—I do not think that it requires any particularly rich land, but such land as you find in Assam. There has been a good deal of indigenous tea, which was found some time ago; there are jungles that were found, when cleared, to have some old tea plantations, which were supposed to have been abandoned many years ago.

8278. In the event of a great diminution in the opium cultivation in India, could tea cultivation take its place?—No; tea could only flourish in a rather hilly country, and opium is produced in the plains.

8279. Sir *T. Bazley*.] Do the Chinese come and labour in the Indian plantations?—No; we

1871.

tried

Mr. W.
Maitland.

1871.

tried once or twice getting the Chinese round, but did not succeed. They have been brought round, not mere ordinary labourers, but men who have been clever in drying the tea; but it has been found, now that the system of manufacturing tea is sufficiently well understood for us to dispense with Chinese labour. I brought them round myself at one time.

8280. Mr. Lyttelton.] Is China opium an opium approximating in strength to Indian opium?—This Report, to which I have referred, says that the samples sent round approximated in strength and in quality to Indian opium in a way that no sample which they had seen before had done. Up to that time it was generally said that it was very inferior both in quality and in strength, particularly in quality. It is a question whether

they are not now improving it so much as to make a really good quality.

8281. I suppose it is rarely found that when an opium smoker is once used to a strong kind of opium he takes to smoking a less strong kind?—He would not unless he were obliged by being too poor to buy the best.

8282. Mr. Cooper told us that the Chinese opium was not more than half as strong as the Indian opium; but your information is, perhaps, more recent than his?—The information which I have is dated about a year and a-half or two years ago; but that information is derived from what the Government of Calcutta have in their own hands. They have got the samples, and their own opium examiner's reports.

Tuesday, 27th June 1871.

Mr. McClure.
Sir Stafford Northcote.
Mr. J. B. Smith.
Sir Charles Wingfield.

THE RIGHT HONOURABLE ACTON SMEE AYRTON, IN THE CHAIR.

Major BATEMAN CHAMPAIN, R.E., called in; and Examined.

8283. *Chairman.*] WILL you be good enough to state what office you hold under the Government of India?—I am Director in Chief of the Government portion of the Indo-European Telegraph.

8284. You are aware that in the accounts of the revenue of India for 1869–70, there is an item for "Telegraph" of 202,932 L., "Ditto in England," 44,110 L., as the receipts for the revenue for that year from telegraphs?—Yes; I do not answer for the Indian portion of that; I only answer for the receipts of the Indo-European Telegraph, which are separate, the English and Indian receipts of the line connecting England with India; I have nothing to do with the telegraphs in India itself.

8285. What portion of that receipt, then, is made up of the telegraphs with which you are connected?—Taking the total sum shown in the receipts for that year, the receipts in India during that year were 73,041 L., and of the receipts in England 44,110 L.; but those are not the actual earnings of the line, because a great portion of that was due to former years.

8286. Those are receipts within the year?—Those are the receipts within that particular year.

8287. Can you tell us what were the actual earnings within that year?—The amount was 76,126 L.

8288. Will you be good enough to state from what telegraphic lines of communication this money is earned?—This money is earned by the Government portion of what is called the Indo-European Line, the original line of telegraph to India. The lines that are under my charge leave Kurrachee and extend through the Persian Gulf to the mouth of the Euphrates and Tigris, and another branch touches the Persian coast at Bushire, and runs up to Teheran; that line is fed from Europe by the Indo-European Companies' special line, *via* Prussia and Russia.

8289. Which joins it at Teheran?—Which joins it at Teheran. The other fork of the line is fed by the European system *via* Constantinople to Bagdad.

8290. By the Turkish Government?—It is supported by the Turkish Government; but at 0.59.

present the bulk of the traffic passes *via* Russia, which is by far the best route.

8291. Do these receipts include only the share of the Government of India for their portion of the line, or are they receipts for the messages through?—What I have stated as the earnings of the line, 76,000 L. odd, are the actual earnings of the line, its own share of the gross receipts for that particular year.

8292. And is there any charge included for transmission in India, or is your line separate for the purposes of this account from the telegraphy in India?—It is separated entirely.

8293. Can you state what has been the general character of the earnings of the line within the last few years?—For the first four or five years we averaged 96,000 L. earnings; then in 1869, from several causes, the receipts fell to 76,000 L.; and afterwards they fell a little again, and now they are rising.

8294. What was the cause of that fall in the receipts in 1869?—From the 1st of January 1869 we reduced the through tariff for a message from England to India from 5 L. 1 s. to 2 L. 17 s.; and although we increased the number of our messages, yet we did not do so sufficiently to make the total receipt equal to what it was before.

8295. What was your share of that reduction?—We reduced our charge from 2 L. 10 s. to 1 L. 8 s.

8296. Are the details of the line under your charge contained in the Paper which was laid before Parliament in 1870?—Yes.

8297. What is the lowest point to which your telegraphic receipts have fallen since the reduction of the rates?—That was the lowest year up to that date, when they fell to the sum of 76,000 L.

8298. Do you happen to know what they were in the last year that is just concluded?—In the last year that is just concluded we have had other causes at work that have reduced the amount; but the number of messages has gone on increasing. Our actual receipts have gone down to 53,000 L., I think it is; but then we also have to add to that a small sum for the earnings of the Persian line.

Major B.
Champaign,
R.E.
27 June
1871.

8299. What

Major B.
Champaign,
R.E.
—
27 June
1871.

8299. What has been the cause of the last reduction to which you have just referred?—The opening of the Red Sea line is the principal cause, which took away a great portion of our traffic for a considerable time.

8300. Has that rendered it necessary for you to alter the rate again?—We have been compelled, in communication with the Red Sea line, to raise our rate from 2*l.* 17*s.* eventually to 4*l.* 10*s.*; it was done gradually. In the year 1869–70 the Red Sea line was not opened. Our share of the rate is still very low; we only get 1*l.* 8*s.* out of the 4*l.* 10*s.*, and a small portion on the Persian line, from Teheran to Bushire, which it is rather difficult to give exactly. We pay a

use of that line; and this last year we got only a total sum of 2,850*l.* for that; so that our gross receipts for the last year, 1870–71, were 56,250*l.* altogether.

8301. How does it happen that you have kept on the lower rate, whilst the whole charge is much higher than it was when you reduced your rate?—We raised our rate. We got our share (a certain share), but not such a large proportion as the company got which feeds us. It was found that they were absolutely unable, owing to the opening of the Red Sea line, to work at the low rates; it was on their account that the rates were raised; and the British Indian Company found that they were compelled to raise their rates. Then we raised merely in self defence, because that raising of the rates reduced the number of messages.

8302. Is the result of opening the Red Sea line that the rates are now higher than they were before it was opened?—They are higher than they were, but there are two good lines to India now; that is an extra security, which has to be paid for by the public.

8303. The whole through rate has been raised, but has your rate been raised in the last arrangement?—Our rates have been slightly raised. We used to get 1*l.* 8*s.* for the whole length of the Persian Gulf, but from Bushire we only got 1*l.*, and the bulk of the messages went by Bushire. Now, since February, we have raised it to 1*l.* 8*s.*; and no matter whether a message comes from Turkey, or *via* Persia, it pays by the cable the same amount of 1*l.* 8*s.*

8304. Sir S. Northcote.] Are we to understand that though the rate has been raised, and the number of messages has increased, the receipts have fallen off?—The rates have not been raised for the year 1869–70, which I am talking of.

8305. But the number of messages, you say, has increased?—Yes, steadily.

8306. And yet the receipts have fallen off?—Yes.

8307. Chairman.] Since the Red Sea telegraph has been opened the number of messages has been reduced, has it not?—Yes; it went down last year from 46,000 to 41,000 messages, I think.

8308. Do you recollect what it was in 1865–66?—About 28,000, I think.

8309. And it went on steadily increasing till 1869–70, when it was 46,000?—Yes.

8310. And this last year it has fallen to 41,000?—Yes.

8311. Sir C. Wingfield.] The rates were raised about two months ago, were they not?—They were raised in February.

8312. Chairman.] But what will your share be of the revenue from the telegraphs under your charge now that two lines are opened?—Well, I am pretty well convinced that we can considerably more than pay our working expenses, which have been reduced very much during the last year, but that we cannot pay any large interest on the capital expended. We have a double and a very expensive line from end to end; it costs a great deal of money to keep up; it is working admirably, but at the same time the rates cannot be put so high as to make the thing pay a really good dividend.

8313. Starting from the 53,000*l.* which you earned in the year just closed, what do you think your probable future gross income?—I calculate that we shall have next year upwards of 70,000*l.*, and that we shall gradually increase our earning, but not very rapidly.

8314. Can you state to the Committee what has been the total sum expended in the construction of the lines under your charge?—The total sum expended is 1,111,000*l.*, but a portion of that is recoverable; I think about 95,000*l.* is recoverable.

8315. Recoverable from whom?—From the Persian and Turkish Governments.

8316. Sir J. Elphinstone.] That was the sum expended by the Indian Government?—Yes, by the Indian Government.

8317. Chairman.] And by the Home Government also, I suppose, in supplying materials?—Yes, that includes all charges.

8318. As well as the expenses of superintendence in laying down the line?—All that.

8319. And can you give us an account of the working expenses, taking the year 1869–70?—Yes, the working expenses for that particular year were 81,000*l.*

8320. And have you them for 1870–71?—For 1870–71, they are reduced considerably; I have not the figures with me.

8321. Perhaps you can give the Committee, in a tabular form, for the period since 1865–66, the receipts and the working expenses, and the surplus or deficiency?—Yes; this Return in my hand gives the total sum expended, up to the 31st March 1870–71, 1,111,973*l.*—(Vide Appendix.)

8322. Sir C. Wingfield.] Since then there may have been some outlay on plant?—There has been no outlay on plant to speak of.

8323. Chairman.] Referring now to the Parliamentary Paper, can you give the Committee the information which they desire?—Yes; here are the different years. The working expenses of the Indo-European telegraph for 1865–66, were 70,000*l.* in round numbers; the average earnings from 1865–66 to 1868–69 were 96,000*l.*

8324. Mr. Fawcett.] Will you put side by side in your tabular statement the receipts and the expenses?—Yes; the working expenses were 70,000*l.* in 1865–66; 77,000*l.* in 1866–67; 76,000*l.* in 1867–68; and rather under 70,000*l.* in 1868–69.

8325. Chairman.] Can you tell us what proportion the superintendence of officers bears to the other expenditure?—Would you include the signalling establishments.

8326. No; I meant the superior European officers?—No, I cannot tell you that; I can give you the exact pay of every individual from this table which I have just made up.

8327. What is the superintending establishment?—

ment?—In Persia the whole establishment, including all the signallers, the probationers, the inspectors of the line, the mechanicians, the traffic manager, the medical superintendents, the superintendents of the line, and the directors amounts altogether to 1,665 *l.* per month; that is for Persia itself. Then, in addition to that, there is the Persian Gulf establishment, which includes all the directors, the traffic branch, the medical branch, the electric branch, the workshops, and the whole staff for working the land-line and the cable-line, and the total cost of that is, at present, 2,200 *l.* a month, in round numbers.

8328. Have you the establishments in England and India?—The establishment in England is comparatively small. I have given you the Indian charges as they are paid by the month. In England there is my own salary and office (I am in England generally in the summer, and travelling in the winter; I have just returned about a fortnight ago), amounting to 1,763 *l.* 12 *s.* 6 *d.* The London office is 1,156 *l.* a year, and the Constantinople office is 473 *l.*; that is all that is paid out of India.

8329. At Kurrachee, is there any separate establishment?—That is included in what I have given already.

8330. Is the rest of the expenditure made up of materials and repairs?—The total expenditure is made up in this way: establishment; house rent in Persia for some of the subordinates, which is a small sum of only 330 *l.* a year; travelling expenses, which are rather considerable in Persia; repairs to the line; stores which are required, electric stores, and occasionally iron poles and insulators, and things of that kind; printing and postage; and the payment of the line guards, who are maintained to keep the line in order, and repair it the moment it breaks down.

8331. What is the cost of that last item?—The line guards on the Belooch coast cost us 1,140 *l.* a year, and on the Persian line they cost us 1,200 *l.* a year.

8332. Do you think the expenses are likely to be increased or diminished?—We can reduce them, and are now reducing them; we have nearly reduced to the amount, covering every single thing, of 62,400 *l.* a year, and, perhaps, we can come down to 60,000 *l.* in a very short time.

8333. Would that include all the average annual expenses of relaying and replacing the telegraph?—It includes everything in that way; but no extraordinary expenditure, such as might be necessary in case a cable were utterly broken, or in case the Persian line, for instance, were demolished.

8334. Do you maintain any vessel to look after the line?—We maintain a vessel at Kurrachee.

8335. Is the charge for that vessel included?—A part of the charge is included, all the engineering staff of the vessel is included, but for the last year or two the cost of the vessel has been debited to the Marine Department at Bombay.

8336. How long do you estimate the marine cable will last, or when will it become necessary to incur heavy expenditure to repair or replace it?—That is a question which I think nobody could answer; it has never been found out yet how long cables can be depended upon. Our present cable was laid in the early part of 1864, and it is as good now, and tests as well, as when
0.59.

it was laid; but we have had to repair it very often where it has been chafed by rocks, or cut by an anchor, or where a latent fault has developed itself.

8337. Do you mean that apart from these special causes, it gives no indication of decay in its general appearance and structure?—No, the cable itself does not; we have seen some signs not of general decay, but places have been cut out, and I have brought home pieces to show here; I have had no opinion given of them as yet, but they seem to me to show that a cable cannot be depended upon to last for ever.

8338. But have you been able to form any judgment upon the disintegration of the cable, so as to give us an idea how long it will last?—No; I have only just arrived in England, but the general opinion is that a cable should last 30 or 40 or 50 years.

8339. Sir C. Wingfield.] It depends upon what bottom it lies upon, whether it is mud or not?—Yes; it is impossible to give a general answer to the question.

8340. Chairman.] Does your estimate include repairs of accidents?—Yes; we put down a certain sum for that for a number of years, and we calculate that the cost of the line would be about that.

8341. Sir C. Wingfield.] Mr. Thornton, in his note at page 48 of the Parliamentary Paper of April 1870, says that the annual expenditure for management and maintenance has averaged 80,000 *l.* for four years?—I think Mr. Thornton has given it in round numbers, and I gave you more accurate numbers; but it went very nearly to 80,000 *l.* At page 20 in those Returns, moved for on the 31st of March 1870, you will see the sum total at the bottom for the different years. I see where my error has arisen; I gave you, taking them from these Tables, the working expenses incurred and paid in India, and I did not include those incurred and paid in England, which amount to 45,000 *l.*, to be divided over five years.

8342. Then Mr. Thornton is correct?—Yes.

8343. Then Mr. Thornton says that the working of the Persian lines has cost the Government 23,000 *l.* a year?—Yes.

8344. And he recommended that these Persian lines should be given up and made over to the Persian Government; has that been done?—No; I think that the recommendation was afterwards generally withdrawn. The idea now is that it would be better to keep the Persian lines, which will pay us something; and hitherto they have paid us nothing.

8345. What was the arrangement with the Persian Government for the working of those Persian lines?—The original arrangement was that the Persian Government were to pay for the wire and material from England, and supply us with poles and labour; the English Government were to grant the officers and the men to superintend and to work the line, and the whole of the receipts up to the sum of 12,000 *l.* a year were to be paid to Persia. In those days the traffic did not pass by Persia but kept by Turkey; the consequence was that the receipts never reached 12,000 *l.* a year; and although we were obliged to spend a great deal of money in keeping the line up we got nothing at all by it.

8346. It was as Mr. Thornton says, worked at a dead loss of 23,000 *l.* a year?—Yes.

8347. But since the Indo-European, Mr. Siemens', line through Russia, has been estab-

1871.

lished, does that same arrangement with the Persian Government go on?—No; since Siemens' line was opened we have come to the agreement that, instead of the Persian Government taking all the receipts up to 12,000 £ a year, we give them a lump sum of 4,800 £ a year; we give it them, no matter what the receipts of the line are; and we halve the remainder of the receipts with the company.

8348. What has been the financial result of that arrangement since the opening of Siemens' line; is it that you have been getting some revenue from it?—We have been getting some revenue from it, and we hope to get more.

8349. Can you give me some idea what the revenue was; was it a very insignificant sum?—The first year that that system was tried we received about 10,500 £; deducting the Persian royalty of 4,800 £, there remains 5,700 £; we got half of that, and the other half we take as part payment of the old debt that Persia owes us.

8350. Now it so happens that, in consequence of the British Indian Submarine and the Indo-European (that is Siemens') Line having agreed with the Government of India to raise their rates to 4 £ 10 s., and the Turkish rates not being raised, messages can now go through Asia Minor to Constantinople at a very much lower price than by the Indo-European or Suez Line; is not that the case?—Yes; the rate by Turkey is 2 £ 17 s., as our rate was formerly, and ours is 4 £ 10 s.

8351. So that there is an inducement to people to send their messages through Turkey?—A private individual sending a message about private affairs ought to take the Turkish Line, because the messages only take 36 hours between England and India, but merchants are compelled to take the short line; taking our average for a few days it was 2 hours and 55 minutes.

8352. When the Vienna Convention meets again, is it the intention of Turkey to raise her rates?—We hope to induce Turkey to raise her rates; if we could lower ours it would be a good thing; but there is no understanding come to as yet.

8353. Do you find that on the Indo-European Line, in consequence of raising the rate to 4 £ 10 s., the result has been that while the number of messages has diminished, the amount of receipts has increased?—Yes; they have increased since we raised the rates.

8354. But the messages have diminished in number?—Decidedly; but not nearly so much as to affect the increase of rate.

8355. Then Mr. Thornton says in his memorandum that there is a charge against the telegraphs of 20,000 £, which might more properly be charged against the political department; now I cannot very clearly, looking at the Return, make out what the nature of those political charges is; but first I will ask, has any portion of those charges here described as political, been transferred from the telegraph to the general Government?—Mr. Thornton says: "But besides this, Colonel Goldsmid and Mr. Kellner point out that of the expenses hitherto charged against the telegraph there are several, such as payments for the hire of occasional steamers, that ought never to be repeated, and others that have nothing to do with the maintenance or working of the telegraph, and which, if continued, ought to be charged against the political

department." The fact is that one of those charges, I presume, which is alluded to, is the payment of the political agent and his escort (which he is obliged to have) on the coast of Beloochistan. He was originally sent there to arrange for the construction of the land line along the coast with the petty chiefs of the place, and it was very necessary that he should be there; but, at the same time, he not only did work for the telegraph department, but there is no doubt that he did a great deal for the political department also.

8356. But if there had not been a telegraph there would have been no thought of sending a political agent there, I presume?—Possibly not. I cannot say as to that; but the fact is, that he was charged entirely to the Telegraph Department.

8357. Has that charge been struck out?—We are in future to pay half this; that is to say, we shall pay him altogether, and recover the amount from the Political Department afterwards; half his own pay, and the pay of his escort. Then there were gun boats sent up; once or twice there were little disturbances along the coast, and it was thought advisable to send gun boats. But it should be remembered that in the old days there was always an Indian navy kept in the Persian Gulf, and the necessity of that was recognised at the time. They did away entirely with the Indian navy, and sent up Her Majesty's ships now and then; and the extra cost of the gun boats going up ought not, we thought, to be charged entirely to the telegraphs. For instance, there are occasions when Colonel Pelly, the political agent there, employs gun boats; and I think their cost was charged to the Telegraph Department. Another instance is, that we keep up a station on the Persian Gulf, namely, Angaun, that we have no need for, telegraphically speaking; it is not really required for the telegraphs, but is required really for political purposes. It is a kind of naval station; a coaling station for any of Her Majesty's ships going there; so that we actually keep up a station there, which might be struck off without injury to the telegraph itself.

8358. But you know that the Indian Government pay the Imperial Government 70,000 £ a year for the naval service of the Persian Gulf; so that it is not the fact that, because the Indian navy has been abolished, the service is no longer rendered; it is rendered in another way, and paid for; therefore any charge for sending gunboats to the Persian Gulf, necessitated by the telegraphs, ought surely to be debited to the telegraphs?—It might be looked upon in that way, certainly; but the gunboats have been sent, I believe.

8359. To what degree has this charge of 20,000 £, under the head of "political," which stood against the telegraph, been reduced now; by transferring items such as you describe to the general imperial charges?—This refers to Colonel Goldsmid's letter on the subject. Colonel Goldsmid and Mr. Kellner pointed out that this sum of 20,000 £ might be reduced. I do not know exactly how they make up the 20,000 £. We have reduced everything now that can be fairly done.

8360. You cannot say how much that item has been reduced?—I cannot quite make out how the 20,000 £ is made up. Mr. Thornton makes up several items from Colonel Goldsmid's and from

from Mr. Kellner's letters. The fact is, that now, except the payment to the political agent, and the payment to the tribes, small subsidies to the tribes along the coast, and this payment of 4,800*l.* to the Persian Government, there is nothing in the form of a political charge except this single station of Angaam.

8361. But I suppose you could inquire and put in an exact statement of the amount by which it has been reduced?—Yes.

8362. You say that you have reduced your expenditure on maintenance and management by a considerable sum, and I expect this sum is very considerably made up by the reduction of political charges?—No; the reduction to which I alluded is made up almost entirely of reductions in the working staff.

8363. I forgot what it was you said, that in the last year the cost of management and maintenance had been reduced to—?—About 62,000*l.*

8364. I should like to know to what degree that 20,000*l.* has been reduced by transferring the charges which are still incurred to the political department, because then it becomes a question whether they ought to be so transferred, or whether they ought not to be entirely charged to the telegraph?—I think there are no charges now except this station of Angaam, which we keep up for political purposes.

8365. And you said that half the cost of the political agent on the Beloochistan coast was charged to the political department; he is kept up still, I suppose?—Yes.

8366. Will you put all that in in a Statement?—Yes—(*Vide* Appendix.)

8367. Then the cost of the maintenance ship was for some years charged to the marine department; and now a proportion of the cost you say is charged to the telegraphs?—Yes.

8368. But why should not the whole be charged to the telegraphs; a private company has to pay for its maintenance ship, has it not?—Yes, but this vessel (the “Amberwitch”) is not used entirely by us; she is at the disposal of the political authorities at Kurrachee, and she has also been used for instance, in laying the Ceylon cable with which we have nothing to do; she is not entirely at our disposal, but is kept at Kurrachee if not wanted elsewhere; and the vessel herself is one of the Bombay marine vessels.

8369. You have not attempted to set aside any reserve for depreciation as private companies do, or ought to do?—No, we have not.

8370. The sum of Mr. Thornton's conclusions is, that for those four years the line has paid not more than 1½ per cent., and that the state of things would appear hopelessly unsatisfactory unless, as he thought, you could get rid of the cost of the Persian lines, and the 20,000*l.* of political charges. But if the cost of the Persian lines is not to be got rid of, and if the whole of those political charges are not got rid of, the return in the shape of net receipts will still be very small, and yield a very small per-centage?—Well, I think that Mr. Thornton was wrong in thinking that the Persian line could be done away with; although we have to pay expensively for it, still without it we never could have worked our cable satisfactorily.

8371. I mean that the mode on which he relied of turning an unprofitable into a profitable concern, probably cannot be carried out?—It is, O:59.

I think, impracticable in the first place, because if the Persian line were an unpaying line it would not be likely that the company would volunteer to take it over. That would be merely shifting the loss from us to them.

8372. The expenses were greater than the receipts in 1869–70, were they not?—Yes, for that year they were greater; for two or three years they were greater.

8373. Then “the last state was worse than the first;” but you expect an improvement?—We have had an improvement during the past year, a very great improvement.

8374. In 1870–71, you mean?—Yes; we were working that line in 1869–70 in an exceptionally bad year. We suddenly came down from 5*l.* 1*s.* to 2*l.* 17*s.*, and we had an unfortunate break owing to an Arab revolt, which interrupted our line for three months at the end of the year, and that which did come through our cable came *via* Russia, and we accordingly received only the smaller rate of 1*l.* instead of 1*l.* 8*s.*; so that our receipts were immensely affected.

8375. In 1870–71, the receipts were 53,000*l.*, you stated?—£. 56,250 altogether, including the 2,850*l.* from the Persian Government.

8376. And what were the working expenses?—They were, I think, 63,000*l.* that year.

8377. In case the sender in India does not indicate the route by which he wishes his message to be sent, that is to say, whether Red Sea, Indo-European, or Turkey, what course do the telegraph offices then pursue?—I myself have nothing to do with that; but what is done is this, that if no label or direction is given by the sender (which he is at liberty to do for nothing), the message is then sent by the Government by whichever line has brought the latest date from England.

8378. Whichever line is working quickest, do you mean?—Whichever line is working best; I mean, supposing a message goes from Calcutta, the superintendent there looks at his file and sees that a message has come *via* Russia, say in one hour, and by the British Indian in half an hour; he would in that case send the message, unless directed otherwise, by the British Indian.

8379. He would also consider surely whether the line was occupied at the time?—But he could not tell whether the line was occupied; the line is never so occupied that a message is delayed in that way; if messages crowd in, they are sent 10 at a time; supposing that the Bombay Office was telegraphing to Aden, and both offices had a number of messages to send, they would send 10 from Bombay, and wait until they got 10 from Aden, and so on.

8380. You have lately increased the local telegraph rates in India, have you not?—I have nothing whatever to do with India; as far as our line goes, there is no chance of its being blocked, for we have a double line the whole way.

8381. Do you notice that, at page 48 of Mr. Thornton's Report, he is not very clear whether the cost up to 1869 was 852,000*l.* or 950,000*l.*; which have you assumed in estimating the entire cost up to 1870?—I assume 960,000*l.*

8382. Mr. Crawford.] Mr. Thornton suggests that “if the views set forth above” (in his Memorandum) “are correct, it is in the power of the Government of India at once, or almost immediately, to obtain a net profit on its Indo-European telegraph of nearly 6 per cent., instead of only 1½ per cent. as at present.” Do you agree with

Major B.
Champion,

1871.

with Mr. Thornton in that suggestion?—No, I do not; upon that I think Mr. Thornton himself would change his mind now, and would see that it could scarcely be done; that we could not give over the Persian line, and that it would not be for our interest to do it.

8383. The contract with the Persian Government expires on the 7th of August 1872, does it not?—At the beginning of August 1872.

8384. Have any negotiations taken place with the view of renewing the contract?—None that I am aware of.

8385. Then if none are entered into and concluded, I suppose the arrangement will cease, will it not?—The arrangement would cease so far as we are concerned if no arrangement were made by us to carry the thing on, and the line would then be handed over to the Indo-European Company, who would be compelled to take it even if they worked it at a loss.

8386. That is to say if we gave it up it would pass into the hands of those connected with the Indo-European Company?—Yea.

8387. And the public in this country would still have the benefit of an alternative line of communication with India through Persia?—They would; but I doubt whether the company would be able to work it as well as we have worked it for many reasons.

8388. Looking at the question from the point of view of a private individual, one of the British public, I suppose you think that there is a great advantage in having some alternative line to set against the monopoly that would otherwise exist in the hands of the British Indian Company?—I think that it is an incalculable advantage. In the past year there were occasions when the British Indian line was blocked up altogether, and had our line not been in existence you would have been cut off from India altogether, as far as the telegraph is concerned.

8389. But, as far as prices are concerned, you have put your heads together and raised them against the public?—We were obliged absolutely to raise them.

8390. By what circumstance were you obliged to do so?—By the fact of neither line paying; both lines were working well, but the traffic had not doubled, or anything like it, and consequently the same amount of traffic which was barely sufficient to feed one line before then had to feed two.

8391. Sir C. Wingfield.] When you speak of two lines do you mean, besides the British Indian, the Turkish line or Siemens's?—I am talking of the Indo-European. I could put it in other words. I could say that the traffic which before was sufficient to feed two, was not sufficient to feed three now; but the other gives a better idea because the bulk of the traffic goes *via* Russia, and Turkey could not afford to carry it on if it did not go by Government.

8392. Mr. Crawford.] Do you think that the working of the line in Persia is, for political reasons, of advantage to the British Government?—Yes, certainly, I am of that opinion. We have had very intelligent engineering officers and soldiers in the country, who, as a rule, have got on amicably with the people in the country. We have made the only good map that there is of the whole country between Teheran and Bushire, and about which there was a great deal of ignorance shown in the former war. Now we have certainly 50 or 60 Englishmen who know

the whole country well, not only along our line of telegraph; and, as a rule, our officers and men are very much liked by the Persians.

8393. Would you deprecate the giving up of the line on the ground that you would lose political influence by doing so?—I should very much deprecate it; and I think that now we shall scarcely lose on the Persian line, or only lose very little; we shall pay more than half our working expenses, and we also feed by that, our Persian Gulf cable, which, without it, would hardly get any traffic at all.

8394. Do you think that if the Persian system passed into the hands of a private company, there would be any danger of the efficient working character, so to say, of the English administration suffering?—I think so; and I am perfectly certain that my views are held also by the representative of the company at Teheran, that it would be a great loss to the undertaking if the English officers were to leave Persia. Their social position certainly gives them a better chance than any others have of getting what they want from the Persian officials.

8395. Has personal acquaintance with Persia enabled you to say that there is, in your opinion, a great political advantage to be derived from access to native opinion in Persia generally, that you have through the means of your establishment?—Well, what political opinion there is in Persia, we can get at thoroughly; our officers mix with the Persian gentlemen, go out shooting and hunting with them a good deal, and we see more of them than any other class of people could do. The members of the Legation, for instance, are confined to Teheran, or rarely go away from it. Now, our officers are travelling all over the country.

8396. Considering the contiguity of Persia to India, it is desirable, is it not, to cultivate as much as possible intimate relations of a friendly character?—I think so, decidedly.

8397. And you think that that is one means to that end?—Yes, I do.

8398. If the line were entirely abandoned (to take an extreme view), I do not mean the Persian line only, but the whole Persian Gulf system in connection with your line, you would have to sacrifice a very large amount of property?—A very large amount of property. The cable is there, for instance, and cannot be removed.

8399. You can maintain that establishment and system altogether now, without any additional charge for capital, out of the working expenses?—Yes.

8400. But it would be a dead loss if you gave it up?—Yes, it would be a dead loss.

8401. And we, the British public, should lose the advantage of the competition?—Yes.

8402. Mr. Fawcett.] When was the Red Sea Telegraph opened?—It opened on the 26th of March 1870, I believe.

8403. I understand you, that you have three lines of telegraph to India now?—Yes.

8404. One line, namely, the Indo-European, that you represent, may be regarded as a line carried out by the Government, and the other two as being the result of private enterprise, may they not?—No; one has been the result of private enterprise, the Red Sea line, called the British Indian.

8405. Then the other also has been the result of Government enterprise?—Of Government enterprise in a great measure. We had a line originally

originally made by the Government that carried the messages from India to England *via* Turkey. It was considered that one link of that line, between Bagdad and Bussorah, was exceedingly unsafe because of the Arabs, and to duplicate that link, an alternative line was made from Bagdad up to Teheran, joining our cable again at Bushire; in fact, making two sides of what you may look upon as an equilateral triangle, those two sides being alternative to the base.

8406. Do you know at all the financial position of the Red Sea line at the present moment?—No.

8407. Do you know whether there is any prospect of its returning a dividend?—I have not the least idea. I have been out of the country for the last year nearly.

8408. You would think, if you were the adviser of a private company, that it would be necessary, out of the gross receipts, to set aside, as is usually done in business, some sum for depreciation, would you not?—Yes, I should.

8409. Do you think that 10 per cent. would not be at all an extravagant amount?—I have not studied the subject at all in that point of view, but I should think that it ought to be done.

8410. Then, bearing that in mind, supposing that you look upon this Indo-European line in a mercantile point of view, and that you set aside about 10 per cent. of the gross receipts for depreciation, this line up to 1869 will only have returned on the capital expended about a quarter per cent., will it not?—Very little indeed.

8411. And it only returned that quarter per cent. on the outlay of a million when it had no competition from the Red Sea line?—Quite so.

8412. During the last three years, especially since this competition has taken place, considering that 10 per cent. ought to be set aside from the gross receipts for depreciation, the average loss has not been less than something like 35,000 *l.* a year?—Yes; if that sum were put aside for depreciation there is no doubt there has been a loss.

8413. You say that one of these years was an exceptionally unfavourable year; but even taking the last year, upon the supposition that I have made, the loss is not less than 17,000 *l.*?—You are talking of the last year since the Red Sea line was opened, I suppose?

8414. In 1870–71, the loss is about 12,000 *l.* to 14,000 *l.*, is it not?—We receive about 56,000 *l.*, and we pay about 63,000 *l.*

8415. Then, reckoning the 10 per cent. that should be set aside for depreciation, the loss would be about 12,000 *l.*, would it not?—Yes, it would.

8416. So that, viewing it simply in its direct bearing upon the finances of India, you may say that the Government of India spent a million pounds to realise a loss at the present moment of 12,000 *l.* a year?—I could put it in a better way, I think.

8417. You may allude afterwards to any indirect advantages; but simply viewing it as a financial result that is the case, is it not; or I will put it thus: they have spent a million pounds to realise a loss of 35,000 *l.* during the average of three years?—It is seven years now since the cable was laid.

8418. But then the fair way is, is it not, looking upon it as a financial question, to consider this; you have now a formidable competitor which you had not during the first four years; 0.59.

therefore, looking at the present position of the thing, you ought to consider what its financial position is, now that this competition has been brought against you?—Yes; we did make money our first four years; then we lowered the rate to a sum which prevented our paying our expenses; we went far below the point to which we ought to have gone, but the public insisted on it, and the consequence was that we began to lose money. We have now, during the last four or five months raised our rate again, and we are now beginning to make money, even putting aside the 10 per cent.

8419. When you say that the public insisted, we have always been informed, have we not, that India is not governed by representative institutions; but we have always been told by officials, with a certain amount of boasting, that India is governed by an intelligent despotism; therefore, how can you say that you were forced by the public to do that?—I did not say that we were forced to do it by the Indian public; I meant by the public of Europe. At the Vienna Convention we were represented by Colonel Goldsmid, and at that convention there were the directors general of all the telegraphs in Europe; but we were also pressed by the British public, who said that 5 *l.* 1 *s.* was far too high for messages to India. The Indian merchants may have had something to do with it, but every director in Europe had something to say to it at this convention, and we agreed to reduce our rate from this extraordinary high rate of 5 *l.* 1 *s.* to 2 *l.* 17 *s.*, hoping that we should get as many more messages, that the sum received would not decrease. We did get the number of messages up, but not enough to bring us up to our old receipts.

8420. But when you say the public of Europe, the Indian Government are trustees for the money which is supplied by the Indian people, and not by Europe; therefore their first consideration ought to have been, ought it not, to protect the people who supplied the money?—And they hoped that they would be better by lowering the rate.

8421. Then what it comes to is this: that you were not forced, but, looking upon it simply from a financial point of view, you made a mistake or blunder; your expectations were not realised?—I do not put it in that way, because had the Red Sea line not been laid (and there was no prospect of it then) we should have done nearly as well on the 2 *l.* 17 *s.* by this time as we did on the old charge of 5 *l.* 1 *s.* As I have shown in the paper to which I have referred, the number of messages has steadily increased, but slowly, and there is no doubt that the sudden lowering of the rate from 5 *l.* 1 *s.* to 2 *l.* 17 *s.* must, for a time, affect the receipts.

8422. But without attributing blame to any one, or saying that you could foresee events then, in a financial point of view you made a mistake?—Yes; we brought the rate down too low.

8423. You spent a million of money, and for four years, upon that million of money, you obtained a return of a quarter per cent. During the last three years, during which you have had to meet competition which you will not be able in future to get rid of, you have realised an average loss of 35,000 *l.*?—Yes, if you take the sum of money which we have lost; but you must remember that the million was not spent all at once; the million was spent by degrees. We have got now a double line; we began by a single

1871.

single line, which cost about 450,000*l.*, and on that we were making a certain profit.

8424. That may be true, but still you have spent over a million; how that has been spent it is not for me to inquire, but the fact is so?—A great part of it, on the recommendation of a Parliamentary Committee, who insisted on our doubling our lines to India.

8425. Very likely Parliament has been as much to blame as other people; still, whoever it is to blame (and it is not for me to apportion the blame, or to say whether there is any blame at all), that is clearly and distinctly the financial result; you have spent a million, and during four years upon that million you only obtained a return of a quarter per cent.; during the last three years, when you have had to meet a competition, which will continue, you have realised an average loss upon that expenditure of 35,000*l.* a year?—At that time, the first three or four years, our capital expenditure was not a million, or half a million; and we were realising 96,000*l.* with an expenditure of 70,000*l.* or thereabouts, and we were making a fair profit. Then it must be remembered that the whole thing was very expensive. It was done at a time when telegraphic communication was loudly called for between England and India, when the Red Sea line had been tried and had broken down, and the British taxpayers are now paying upwards of 30,000*l.* for a line which they never sent a message through. In those days nobody would have dreamt of the Red Sea line being started again, consequently the Indian Government set to work, and, after long consultation and examination of the question, made this line to India. There is no doubt about it that it did cost a great deal of money, and in certain ways there has been money spent that we might perhaps have avoided if we had known then as much as we know now; for instance, the line from Bagdad to Teheran need not have been made, because it was made to supplement what we thought would prove a weak link, but which did not prove a weak link; consequently that line never did what it was meant to do. Then our traffic was increased, and a second line was made, and consequently a very considerable sum was spent; but it appears to me that it was necessary, and that it has done an immense deal of good before the Red Sea line was dreamt of. And even supposing you say that it is a bad speculation, you cannot take the line up and sell it again; it has done its work fairly for some years, and very well for the last two years, and will do its work very well. It is cheaper to keep it than to give it up, because you more than pay your working expenses.

8426. I am not advocating giving it up; but am I not correct in saying that from a Paper laid before Parliament, for which Mr. Thornton, the head of the Public Works Department, is responsible, it appears that in the four years during which you had no competition, only 1½ per cent. was realised on the outlay, and that that 1½th was only realised by the untradesman-like, unbusiness-like proceeding of not setting aside any portion of the gross receipts for depreciation; those are official facts, are they not?—Those are the facts according to Mr. Thornton.

8427. And he is responsible, is he not, for making official statements with regard to the expenditure?—I have no doubt that Mr. Thornton is perfectly correct.

8428. I understood you to say that the British

public, the mercantile interest I suppose, had called out for a telegraph with India, and that a large sum had been absolutely thrown away?—No; I did not say thrown away.

8429. I thought you said that 30,000*l.* had been thrown away?—That was in reference to the old Red Sea line; that was paid for, half by the Treasury and half by the Indian Government; that was a line that no message, you may say, practically was ever sent through; at the time there was no idea of putting another line down in the Red Sea.

8430. Mr. Crawford.] That line was tried as much owing to the exigencies of the Mutiny as to the wishes of the mercantile world, I suppose?—No doubt.

8431. Mr. Fawcett.] Do not you think that there is a great tendency in laying out these telegraphic works amongst the mercantile public in England, to call on the Government of India to supply them with luxuries, and then to call on the Indian public to pay for them?—I cannot say anything about that; but I think that this line ought to have been paid for as much by England as by India. It was so in the old Red Sea cable, I think; and I think it is unfair to expect India to pay the whole of this.

8432. Both in regard to the Red Sea line, and in regard to this line, you think that certainly the whole loss, whatever it may be, cannot be with justice inflicted on India?—I think that is the way in which it ought to have been done originally; but the management of the whole thing has been in the hands of the Indian Government, and of course they are responsible for the working of the line, and the financial results.

8433. I think I understood you to say, that you looked forward to an improvement in the financial position of the Indo-European line, from the probability of the charges on the Turkish line being raised?—No, I did not say that. I said that I hoped they would raise their rates, because it gives us such immense difficulty in settling the accounts, and also in directing the traffic. It is very complicated altogether, to have one line charging cheaply and one expensively for the same message; but, as far as we are concerned, it does not matter; the Turkish messages come through our line, and so do the Persian, and we do not care as far as our receipts go.

8434. Then the general result of this telegraphic communication has been this; you have had to raise your charges and make them extremely high, and the direct financial result has been extremely unsatisfactory?—I say that the financial results when the charges were high were not so unsatisfactory as when they were suddenly brought down to this low figure.

8435. Still, on the whole, considering it simply as a pecuniary speculation, the financial results have been extremely unsatisfactory, have they not?—I think that they have not been satisfactory in every respect certainly, as far as the finance only is concerned.

8436. How is this million that has been spent on the telegraphs, or the 1,100,000*l.* been obtained?—I am not aware.

8437. You do not know whether it has been obtained by loan?—No, I am not aware.

8438. I have heard that one reason why the telegraphs financially considered are not more satisfactory is, that they were constructed at an unnecessarily

unnecessarily great cost; can you give any opinion on that point?—I do not think so at all; I think that the Persian line, the land line, and the Mekran land line were made very cheaply. There have been certain sums expended which would sound large in this country; for instance, sums expended on housing the clerks on the coast of the Persian Gulf. You could not possibly send men to live in a climate of that kind unless you gave them better houses than they would call for in Europe; therefore we have, no doubt, been put to expenses that would sound rather large to anyone that did not know the country, and had not been out there and seen what was really required; but I do not think that any money has been spent unnecessarily; the line itself is not made solid enough in Persia; we have been gradually substituting iron for wooden posts; and no doubt if a little more money were spent in that way, money would be saved in the long run.

8439. I am not alluding to that so much, but I have seen it alleged that one reason why these telegraphs did not pay was, that the stores had been bought at too dear a price in England; for instance, that the cables and other materials sent out had been bought at an unnecessarily dear price; have you ever looked into that question?—It is certainly not true, the whole thing is given out at tender; makers tender to manufacture the cable, and as a rule, *ceteris paribus*, the lowest tender is accepted; and our cable cost precisely the same as at that time the cable of every private company cost; of course it varies from year to year, but at the time we paid precisely what the company would have paid for the same work.

8440. Is the system pursued that of a perfectly open competition, or is the system pursued (which I know prevails at the Indian Office) of certain selected firms being allowed to compete?—I cannot say; I had nothing to do with the manufacture of the first cable; but this second cable which was sent out a year and a half ago, was made by the only man who makes cables of that description, his charges being cheaper; it cost about the same to get the gutta percha manufacture. We selected Hooper's core for our second cable; at that time I know five or six firms tendered for covering the core.

8441. But when you say that it was put up to competition, you are aware that it makes the greatest possible difference, whether it was put up to open competition or whether a few privileged and selected firms were allowed to send in contracts?—Yes, but there are not very many firms in England, who do manufacture those things; I think that all the firms that do manufacture them with the exception of perhaps one or two people, were called upon to tender.

8442. But you cannot state whether the competition was an open one?—No, it was done through the Indian Stores Department.

8443. And their system generally is to confine the competition to certain selected firms; they allow certain selected firms to compete, do they not?—I do not know that.

8444. When you said that you were perfectly certain that the telegraphic stores had not been bought at a higher rate in England, because they had been put out to contract, you are not certain, and you cannot state from your own knowledge, whether it was a perfectly open competition, or the contracts were limited to a few selected

firms?—No, I am not aware. I had nothing to do with that, but I know perfectly well that the rate was not at all a dear one. I know what ought to be paid perfectly well, and I know that it cannot be satisfactorily done for much less. In the purchase of iron wire very often, we have had perfectly open competition and the result has been no end of trouble and delay. We wanted some iron wire for Persia once, and wire to stand certain severe tests; I wanted it done by a particular firm who had always given satisfaction before, and not to be put to open competition. It was put to open competition and the consequence was that we had the most terrific trouble; none of the wire that we had, stood the test, and we lost six weeks, and then we had to go to the man to whom I wished to go in the first instance.

8445. Mr. Crawford.] The effect of open competition is often to raise the price, is it not?—You often get bad material by it; and if you have six or eight of the first manufacturers in England, you know perfectly well that there is not too much asked, and if you go to a cheaper man by a few shillings a ton, you lose time in the end.

8446. Mr. Fawcett.] But as a fact you do not know which system was adopted with regard to buying stores in England for the telegraphs?—No; I know that a certain number of firms tendered.

8447. Chairman.] When there is a select competition, upon what principle is the selection made?—That I cannot tell you; but Mr. Thornton can. I know that anyone in England will tell you that the cable was a cheap cable. We did not pay high prices; and I do not know a single instance, in all the large purchases that we have made, in which we have paid more highly than companies would have paid in the open market.

8448. Mr. Fawcett.] Do you express that opinion after examining carefully what has been paid by the private companies?—Yes.

8449. Mr. Birley.] Who are the manufacturers of the cable?—The cable is generally manufactured by one or two particular people; the first cable, the core was manufactured by the Gutta Percha Company, and covered by Henley, at North Woolwich; the second was manufactured, by Hooper, of indiarubber, and was covered also by Henley.

8450. Are they both working well?—Yes.

8451. Were they both about the same cost?—Very nearly the same cost.

8452. And do you suppose that the reason that Hooper made the second was because he was cheaper relatively than the others?—No, it was a new material that we tried; and he was the only man who knew how to make it in England. We had tested it in Abyssinia, and we had tested it for river crossings in India; and Colonel Goldsmid, then the head of the department, suggested that Hooper's core of indiarubber, which appeared to stand warm climates, should be adopted in the new cable. There was no other man to make it.

8453. You were asked about the depreciation, whether 10 per cent. would not be a reasonable depreciation; but you told us, I think, that you hoped or expected the cable to last 40 or 50 years?—I said that it is impossible to give any good answer on the subject. It is more a hope than an expectation. I think that nobody

1871.

in England can tell how long it will last; some say that a cable will last for ever.

8454. Then it is impossible, is it not, under those circumstances to decide what would be the fair amount for depreciation?—I do not think that the question of depreciation in this concern was ever considered.

8455. But you were asked about the depreciation; and undoubtedly depreciation should enter into the consideration?—Yes; but it is a very difficult question to form a judgment on. I confess that if I were a shareholder I should like to see 10 per cent. put by, because I do not believe that they are such lasting things as many people consider.

8456. Have you any contract with the companies to maintain the cables, or any guarantee as to their duration?—No, none.

8457. Do you maintain it entirely out of your own annual expenditure?—Out of the annual expenditure.

8458. Now, with regard to the first construction of this cable, I suppose it was quite clear that it would never have been laid down by private enterprise; at least, not laid down within any reasonable term of years?—I may remark that the preceding cable laid by the Red Sea had to be guaranteed by the Government, because private enterprise would not guarantee it; then that failed, and it is not likely that private enterprise would have come forward again without the guarantee.

8459. Was any attempt made by private persons to induce the Indian Government to lay the cable in the Persian Gulf?—I am not aware.

8460. I suppose that it was calculated at the time that it would be ultimately remunerative?—I believe it was looked upon as a necessity, and it was hoped that it would be remunerative also.

8461. But it would have been undertaken at the time, even if not likely to pay a commercial interest, would it not?—Yes; just after the Mutiny it was looked upon that the telegraph was necessary, and that it might save the empire, or at any rate save millions.

8462. You were asked some questions in regard to our political relations with Persia; has the cable had any beneficial effect as to our commercial relations with Persia; has it increased the trade, do you think, to any extent between India and Persia?—No; I cannot say that it has. There is very little trade between India and Persia, I think.

8463. I understand that the charge for a message now along the line is 4*l.* 10*s.* from England to Calcutta?—Yes.

8464. And of that the Indian Government receives 1*l.* 8*s.*?—£. 1. 8*s.* is the Indo-European portion, and I think 9*s.* 6*d.* for India.

8465. That is 1*l.* 17*s.* 6*d.*; is that a fair apportionment, do you think, of the 4*l.* 10*s.*?—Yes; I think that, considering the expense of supporting the different sections of the line, that is fair.

8466. Can you tell me what are the rates upon Siemens's line, the Russian line?—They have been changed very often.

8467. Are they very nearly equal to your previous rates?—Very nearly. We, in Persia and India, get about half the entire charge.

8468. Mr. Beach.] Where is your office situated in India?—At Kurrachee.

8469. What other stations are there?—Not any of the Indo-European. We end at India, and then the Indian department begins.

8470. Do you see your way to reducing the expenses?—I have just been over the line, from one end to the other, to examine into that.

8471. I think you state that ultimately you can make some reductions?—I can bring it down to about 62,000*l.* a year, stores from England included, and political charges and everything; and I do not think that the line can be well worked for much less than that, though we may gradually come rather lower, perhaps; we can do that at once.

8472. Therefore all you can look forward to is a very small surplus of receipts over expenditure?—For a time a very small surplus, that is to say, for the next year or two; but I think that as the Australian and China lines are completed, the traffic will develop itself there. We shall get a share of it, and I think that we may calculate on very much larger receipts after a few years. In the meantime we must certainly do much more than pay our working expenses, though we cannot give anything that you may call a reasonable dividend on the large capital sunk.

8473. Sir T. Bazley.] Can you inform the Committee on what you ground your hope that there will be an improved revenue next year?—On the fact of our having raised our tariff during the last two or three months, and on the experience of the last few months. I can see, that if it goes on as it is now, we shall have more this year than last.

8474. And do you anticipate a greater number of messages at the higher price?—I anticipate that we shall have nearly as many messages as we had last year at 1*l.*, this year at 1*l.* 8*s.*

8475. And is the rival company acting with you in advancing the rate?—It was done while I was abroad. The two companies, I believe, came to an understanding that it would be simply impossible to work at the existing rates. I cannot speak now from my own knowledge, but only from what I have heard casually, and believed to be the case; but, as I understand, they came to the conclusion that the rates were too low, and that it was absolutely necessary for their own existence to raise them; and the real truth is that the public had to pay for the security given by two lines.

8476. The pecuniary results appear to be unsatisfactory, but are there any compensating benefits to politics, to commerce, or to agriculture?—I think that it would be impossible now to do without a telegraph line to India, or at least very difficult; it would be very unwise to depend on a single string to your bow, either on the Indo-European without the British Indian, or on the British Indian without the Indo-European, if it can be avoided. I think that immense advantages are derived; all the mercantile business is now done through the telegraphs; I believe that a great part of the business of the Abyssinian War was carried on through our telegraph; and I think that the messages that pass between the Viceroy and the India Office must be of great importance to the Government of India; and in other ways it is incalculably useful.

8477. You do think, therefore, that there are public advantages that compensate for the loss?—Most decidedly. I say that the loss has been incurred

incurred and cannot be got over; that by giving up the line now you would gain nothing, but you would create an immense quantity of trouble and vexation and inconvenience to the Indian public and to the British public, and indeed to the European public; and that, as long as the line more than pays its working expenses (it is a pity that it does not pay more, and, if possible, it must be made to pay a dividend), it is wiser to keep it up than to abandon it when you cannot recover the capital sunk.

8478. *Mr. J. B. Smith.*] Do you happen to know the cost of the Red Sea line?—No, I have heard it.

8479. Do you know whether they make any profit out of it?—I am not sure; they were rather unfortunate in their first year; no doubt they have made something.

8480. Do you know whether they pay a dividend now?—No, I cannot say; I have only been in England a short time.

8481. *Mr. Grant Duff.*] In considering so very complicated a matter as telegraphic communication with India, to shut out from your view everything except questions of receipt and expenditure, is deliberately to prevent yourself obtaining a correct view of the matter, is it not?—I think so, decidedly.

8482. Then you would say, I suppose, that to call, like the honourable Member for Brighton, the proceedings of the Government of India, untradesmanlike, is not to pass upon it a very scathing condemnation?—No.

8483. You would say, I suppose, that tradesmen should be tradesmanlike, and statesmen should be statesmanlike?—Yes.

8484. *Mr. Birley.*] Are the Government messages charged to revenue?—The Government messages are treated precisely like any other messages. Government officials at either end pay like any private individual.

8485. *Mr. Crawford.*] Is there much Indian business done on the line between India and Persia; do the natives use it much?—If you mean the coast of the Persian Gulf, there is very little business and no trade of importance.

8486. Trade between Bushire and India, for instance?—A certain amount; not much is done through the telegraph; it is very insignificant.

8487. Do any of the merchants who ship wool from Beloochistan down to Bombay use the telegraph?—Yes.

8488. And in the interior of Persia is it used by the Persians for their own purposes?—They have a local wire on our posts set apart for their own private traffic with which we have nothing to do. We taught them to work it and handed it over to them, and they do a great deal of business on their own wire.

8489. In the English language, or in their own?—In the Persian. We invented an alphabet for them and set them to work, and some of them signal beautifully.

8490. *Mr. Haviland-Burke.*] Did I understand you rightly to say that you thought the expense of this cable should be borne partly by the Indian Government, and partly by the English?—That is what has always seemed to me the right thing. I have no right, perhaps, to form an opinion of that kind, but it seemed to me that the two countries that have the benefit of it should bear the expense between them.

8491. *Chairman.*] In making your estimate of expenditure in the future, do you make it on the 0.59.

same basis as you have described with reference to the vessel that is employed, that is to say, no charge being made for that vessel?—Yes, I have taken it without the vessel. That is the only thing that could be in any way charged to us; that is the only thing that might be added to our estimate.

8492. Are there no other charges that are charged to the other heads of account for services rendered in connection with this particular service?—No; there is the political charge, which is included in this.

8493. I mean, is there no other charge for services rendered to you which are not included in your estimate except the vessel?—No, nothing else. An honourable Member asked me just now how the 4*l.* 10*s.* is divided. It is divided thus: London to Teheran, 2*l.* 2*s.* 6*d.* goes to the company, out of which they pay the royalties to Prussia and Russia; 10*s.* goes to Persia for the transit from Teheran to Bushire, and 1*l.* 8*s.* for our cable, and 9*s.* 6*d.* for India; so that the company gets 2*l.* 2*s.* 6*d.* out of 4*l.* 10*s.*

8494. *Mr. Crawford.*] Do you know if the 9*s.* 6*d.* is charged at Bombay upon a message by the British Indian?—The British Indian charge it, but they retain it.

8495. Do the Government take 9*s.* 6*d.* for a message received at Bombay?—They do not at present.

8496. Do they intend to do so?—I think very likely they will. The company take it now; the sender here pays 9*s.* 6*d.*

8497. *Mr. Eastwick.*] Am I right in thinking that the local traffic is increasing on the Persian line?—Very considerably, I believe. I know that it began paying. They did not understand what the telegraph was when we went there, and now the wire is constantly occupied for messages, partly official to the various governors, and partly by the merchants of the different towns; but we have nothing to do with that traffic.

8498. Was any proposition made to you by the merchants of Shiraz?—To one of my officers in charge of the line in Persia. The merchants in Yezd, who have lately started the cultivation of the poppy, offered to pay all expenses that the telegraph would entail if the English officers would get the material out from England, put it up, and send in the bills to the merchants.

8499. And it is possible that there might be other towns in Persia to which the telegraph might be extended, subsequently?—No doubt about it. It would take some time before you could pay the expenses. The expenses of putting it up in a country so far from the sea, and so far from the manufactories of wire are so very great, that you would require infinitely more traffic than would pay in this country.

8500. There were very unusual expenses connected with the line in Persia, in respect of guarding the roads, and so on, were there not?—Yes; and then the roads are so fearfully bad, there are no carts, and everything has to be carried up passes. I think our line itself goes 10,000 feet above the sea, close to Bushire. There are six of these passes one after the other, and everything had to be carried on mules over these dreadful roads, which increased the cost of the whole thing enormously.

8501. But had the Persian line not been made, there might have been times when there would have been a complete suspension of telegraphic communication with India?—We should have been

1871.

been cut off, and were absolutely cut off this year, but for that; and last year, at the end of 1869, I mean, for three months, if this Persian line had not existed, there would have been no messages sent at all.

8502. That would have been not only a great private detriment, but a great political injury?—It might have caused irreparable injury.

8503. During the Abyssinian War, were messages sent by that line?—Those, I think, went chiefly by the Turkish line, because the Persian line has only been in its present good efficient state since March, when it began to be properly fed by Siemens's line.

8504. That cable was laid down by the Indo-European, was it not?—All the cables in the Persian Gulf were laid down by the Indian Government.

8505. You would consider telegraphic communication with India perfectly safe, even supposing your line should fail; there will always be two alternatives?—Yes; it is scarcely possible to imagine such a coincidence as all the lines failing at once.

8506. If the cable were to fail, you would still have the land line, would you not?—Yes.

8507. Are you at all aware whether the Shah has showed any gratification in the construction of the line; has he taken any interest in it?—He used to come and sit in the office, and has often spoke to me about it, and he constantly makes use of the line to converse with the governors in the different cities. The Persian officials use the line very much indeed, and the merchants too.

8508. Do you know anything at all about the vessels that were sent up in consequence of the telegraph from Bombay to the Persian Gulf;

were they English men-of-war?—The gunboats were Bombay marine vessels.

8509. But had the Indian Navy existed, there would have been no expense at all on that account?—No.

8510. That was simply owing to the doing away with the Indian Navy?—Yes.

8511. Have you happened to see those gunboats that have been sent up the Persian Gulf?—I think that I have seen them at different times.

8512. Are they suited for that very hot climate?—I do not know whether you are alluding to the gunboats lately sent out.

8513. Did you see the "Bulfinch" for instance?—I cannot say anything about that.

8514. The "Amberwitch" is, I suppose, thoroughly adapted for so hot a climate?—Yes; I have never heard any complaint of her; but it is not comfortable on board ship in so hot a climate at any time.

8515. Mr. Grant Duff.] Have you the tariff of the Indian telegraphs here?—No, I have nothing to do with the Indian telegraphs; but I can get it.

8516. Mr. Fawcett.] I suppose the Telegraph Department is liable any moment to be deprived of your services and your experience by your being called to your regimental duties?—It is quite possible, but unlikely, I think.

8517. In fact, if war was to break out, or anything like that, the Telegraph Department would have no power whatever of retaining you if your services were required in the army; the army has a prior claim to you, have they not?—I suppose so.

8518. Mr. Grant Duff.] That would be entirely a question for the Government?—Entirely.

Mr. WILLIAM THOMAS THORNTON, called in; and Examined.

Mr. W. T.
Thornton.

8519. Mr. Grant Duff.] You are Secretary in the Public Works Department of the India Office?—Yes.

8520. Have you heard the evidence that has been given by Major Champaign respecting the telegraphs?—I have.

8521. Would you like to give any explanation upon any points that seem to you to require further explanation?—There are two or three of the questions that he was asked, with respect to which I should like to supplement his answers. Sir Charles Wingfield asked him two or three questions which I think might, with more propriety, have been asked of me, because he asked what I meant by certain things I had said. I should mention that I did not come here prepared to answer any questions with regard to the Indo-European telegraph; I thought that I was to be examined about the Indian telegraphs only; but still, I think, that I can explain these matters likewise sufficiently. It is quite true that in that memorandum of mine, written some two or three years ago, I did recommend that we should withdraw altogether from our telegraphic connection with Persia, and at that time that seemed to me the proper course; and if the circumstances were the same now, I should say still that it was the proper course; but the circumstances are very considerably altered. At that time, taking the whole of our Indo-European telegraphic establishments together, that is to say, the Persian part proper, the Persian Gulf, and the Mekran Coast, three

distinct branches (I really forget now what their cost was; it is stated in the Papers that have been presented to Parliament), the net receipts were sufficient to pay upon their entire cost an interest of one and one-fifth per cent. Now, at that time, the only portions of the establishment which were at all productive were the Persian Gulf portion and the Mekran Coast portion; although it is quite true that there did actually exist the telegraph through Persia, yet still that line was so exceedingly little used that it might almost have been said not to have been used at all. I do not say that no messages went by it, but by far the greater part went by Turkey; so that while we were expending an immense deal upon this Persian line proper, it was really of no use to us, and what I said was, that if we could withdraw from our annual expenditure the part which belonged to Persia proper, then our gross receipts would be sufficient to raise the per-centage on our original outlay. I do not recollect how much, but so as to make it very much more than it had previously been. That was what I thought was the proper course to pursue then, but the circumstances then were rather peculiar. At that time I will not say that there was no prospect of a Red Sea cable, but at any rate, the prospect was of very doubtful realisation. One thing we did know, and that was that Siemens's Company was making a very efficient line through Persia, which was to join on to the Persian line, and that was all that we did know. Well; I said then that it was quite

quite impossible to say whether Siemens's line would turn out as efficient as he said it would, but still it was quite probable that it would; and in fact, in those days we thought that the prospects of Siemens's Company were really very much better than they have turned out to be; most people thought that it would turn out a very efficient concern indeed, and so I have no doubt it would, had it not been for the Red Sea competition. But then supposing that we had withdrawn from Persia, one of two things must have happened, either the Persian Government must have worked their own line of telegraph (which they simply could not do), or they must have gone to Siemens, and asked them to do it on whatever terms Siemens liked, and Siemens would of course have got it on such terms as would have rendered it to them a paying concern. In that way it would have appeared that we should have been perfectly certain of getting whatever good the Persian line could do us, without paying one farthing for it, and therefore it seemed to me that we might just as well withdraw from Persia, and get rid of the expense. But since then the Red Sea cable has been established, and as Major Champain has said, the traffic which in those days might have sufficed for one line (because in point of fact there was virtually only one line in existence in those days; the only line practically in use being the Turkish Indo-European line), and would have been sufficient to have paid a reasonable dividend upon that particular line would not be enough for three, and has proved not to be enough for three, because now the traffic has to be divided between the Turkish portion of the Indo-European line, and the Persian portion of it, and the Red Sea line; and as was proved at the beginning of this year, it does not pay anybody. The Indo-European Company's line was understood to be worked at a loss, the Red Sea Company's also was, I believe, being worked at a loss, or at an exceedingly small profit; and with regard to ourselves, the 1½ per cent. of profit which we were making a few years ago was turned into a loss, and we were making nothing at all. But for all that, if now the question were raised, whether we should withdraw from our telegraphic connection with Persia, there would be one or two reasons why we should not do it. One reason is that if we withdrew, there would be nobody to succeed us. Siemens's Company are barely holding their ground, and they could not afford, therefore, to work the Persian line at a loss; and at a loss, apparently, it always will have to be worked. It is quite true that within the last two or three years, since Siemens's line has been opened, whereas we formerly did not get one penny from it, we now get some 3,000*l.*, or 4,000*l.*, or 5,000*l.* a year; but still these thousands a year are not equal to our working expenses, and there really is no apparent prospect that the Persian line proper ever will pay its working expenses. Therefore it is not to be supposed that if we withdraw from our connection with Persia, Siemens's Company, which is now barely keeping its head above water, could undertake to work this line, thereby diminishing whatever profit it may make by so many thousands a year. It would not do it; but if it would do it, even then it could not work it nearly so efficiently as we, because we, as the Government, have a certain power and influence; I mean that our officers have a certain prestige in Persia,

which would not at all belong to the officers of any private company; if Siemens's Company were to work the Persian line, their officers would not have anything like the same respect that ours have; their orders would not be attended to in the way that ours are. They would certainly feel this, and (always on the supposition that they would undertake the working of the Persian line) finding that they could not get on as a commercial body, what they would do would be to throw themselves into the hands of Russia, which would be very willing to give them assistance; and Russian officers would then be doing what British officers are doing now. Therefore it is worth our while paying something, and losing something, for the purpose, if not of maintaining our own political influence in Persia, at least of preventing that influence being transferred to Russia. Though it is clear that we shall lose by maintaining the working of the Persian line, still many a person would think that it is worth incurring a moderate loss for the object. It would not be worth while to go on losing 23,000*l.* a year, as we were doing at one time; but now that has been reduced. It has been reduced by the reduction of expenditure which has been alluded to; it has been reduced also by there being a considerable amount of revenue to set off against it. That is what I wanted to say with regard to the recommendation which I did make some years ago, and which I certainly should not be disposed to make now.

8522. Is there any other point on which you would wish to give an explanation? Yes; the question was asked of Major Champain, why it was that the Indian Government made the communication between Bussorah and India. Now, I do not know that I can give very precise and accurate information upon the subject, but I can say generally, that we had entered into an engagement with the Turkish Government, that if they carried a telegraphic line down from Constantinople to Bagdad or to Bussorah, we would connect it with India; and this was the state of affairs when I first took charge of the Telegraphic Department in the India Office. We did not at all like having this obligation, but it was insisted that we had no choice in the matter; that it was absolutely incumbent on us to go to the expense of laying the cable from Bussorah to Kurrachee; I mean, that we were under a pledge that that cable should be laid. No private enterprise would touch the matter at all; it had had the experience of the Red Sea cable, and there was no company, and no individual who would have given 1*l.* towards laying down a cable in the Persian Gulf; and therefore, inasmuch as the Indian Government had in some way or another contracted this obligation, it had no choice but to fulfil that itself. This I say in excuse for the Indian Government having undertaken what even then might possibly be supposed to be certain to insure a loss. It was not so believed; on the contrary, it was believed by those persons who took most interest in the matter that that cable would prove exceedingly profitable; and I think in all probability it would have been profitable if the Indian Government had been content with laying down the cable, either the whole way from Bussorah to Kurrachee, or, cheaper still, from Bussorah to a certain point on the Persian coast, where it touches the Mekran coast, and then from there have continued the

Mr. W. T.
Thornton.
—
27 June
1871.

the communication by means of a land line along the Mekran coast to Kurrachee; that would very likely have not cost one-third of what the whole undertaking has cost; and then upon that outlay, I have no doubt the receipts which we were obtaining four or five years ago, would have afforded a considerable dividend. Then of course the question is asked, why we made the line through Persia, and why we made a double line along the Gulf. All I can say is, that we were not so wise then as we are now. If we could have foreseen what would have been the result, we should not have done all this. Nobody looking back on it as a commercial speculation can doubt that it has proved a failure. We really have not results of any kind whatsoever, that are a sufficient compensation for the expense incurred; but then it does not at all follow that, because it was a bad speculation and we ought not to have spent that money, therefore it would be wise to abandon what the money has created, and so render the expenditure utterly useless. We shall not incur any further expense by going on with it; there is no doubt that this telegraph will at least pay its working expenses, and if it does that, we had surely better avail ourselves of such advantages as it is capable of affording, instead of refusing to use them because they have cost so much.

8523. Mr. Carr.] Have the Turks any line from Bussorah, through the Euphrates Valley?—Bussorah is near the mouth of the Euphrates.

8524. Yes; but is there any line from Bussorah, through the Euphrates Valley to Constantinople?—Decidedly. From Constantinople (I cannot specify the precise route), it goes to Bagdad, and from Bagdad to Bussorah.

8525. Does it go from Trebizond?—Not from Trebizond, from Constantinople.

8526. You do not know what line it takes from Constantinople?—The map would show it. I know several of the places which it goes through. It goes through Moossul, for example.

8527. Is not that the shortest way to Europe from Scinde, from Kurrachee?—I should say, certainly, it was.

8528. Is that line always kept open?—Every now and then it is interrupted for a certain number of days.

8529. It passes through independent tribes, does it not?—Scarcely; after it leaves Bagdad it passes through a country inhabited by Arab tribes, who are very often in a state of insurrection, and who really did interrupt the working of the line for two or three months, not very long ago.

8530. Practically there is not much difficulty in protecting it, as I gather from you?—I believe that was the only occasion on which it was interrupted for a considerable time; but on that particular occasion it was interrupted, I believe, for four or five months.

8531. So that that would not be a safe line to which to trust messages, if you had no other?—It was only on that account that we made the line through Persia.

8532. Sir C. Wingfield.] The Persian Gulf is in triplicate now; it has three lines?—There are two lines of cable and the land line; there is the line along the coast. The cable is double, not for the whole of the distance, but for a considerable part of the distance.

8533. From Iashk to Fao, or Bussorah, it is double?—Yes, the line is double there.

8534. Mr. Crawford.] Is it through your department that representations pass, which are made to the Government here on the subject of telegraphic communication with India; for instance, if the British Indian Company have occasion to make a complaint, does it go through your department?—Yes.

8535. Have they made any complaints?—Very frequently.

8536. A very great many?—They are always making complaints.

8536*. Are those complaints invariably not founded upon some reason?—I should not say so. I should say that the complaints are generally exaggerated. I should say that sometimes they are founded in reason. I should say more frequently not.

8537. Have they not complained of difficulties thrown in their way by the Government of India as to the method of treating the company in India?—They have done so.

8538. Is there any correspondence that we could see on that subject?—I do not think that there is any correspondence that you might not see; it is imperfect, because we have not the replies from India; and it is in an incomplete state now. Not long ago we received a long communication from them, and the reply made to them was that the Secretary of State suspended his decision until he received explanations from the Government of India; it has been sent out to India, and we have not yet had the answers of the Government of India.

8539. Is that long letter in the nature of a *résumé* of all the complaints?—Yes; it is signed by Lord William Hay.

8540. The perusal of that will give the Committee a fair idea of what they have to complain of?—Yes, certainly.

8541. They complain, do they not, that they have not met with a warm reception in India?—They do complain of that certainly.

8542. That difficulties have been thrown in their way?—So they complain.

8543. You do not admit that they have met with any unreasonable difficulties?—On the contrary, I think that the Red Sea Company were particularly well treated.

8544. Do you think that facilities have been given to them?—I should say so, certainly.

8545. Have they any office of their own in Bombay?—They have not; they have accommodation in the Government office.

8546. They are not allowed to have an office of their own?—This accommodation in the Government office was offered them instead, and they accepted it with thanks.

8547. Had they previously made a request that they might have accommodation out of the Government office?—They had, but still they accepted this other accommodation with thanks.

8548. Because they could get nothing else?—It is not for me to say for what reason.

8549. Is not a charge made of 9 s. 6 d. for the delivery in Bombay itself at a house next door to the office of the company of a message received from England?—It is charged and it is received by the company.

8550. Nine shillings and sixpence, whatever the distance may be, which it travels in India?—The charge is the same in any case; but if the message is delivered outside of Bombay, the money belongs to the Government, whether it is at Bycullah or at Madras, or at Calcutta; but if it

it is delivered in Bombay, that 9 s. 6 d. is at this moment received by the company.

8551. Do you know the distance of Bycullah?—I have heard that Bycullah is two miles from Bombay. In order that a message should go from Bombay to Bycullah it must be carried by the wires which belong to the Government, and for that conveyance by wire, whether it is to Bycullah or to Madras the Indian Government charges 9 s. 6 d.

8552. If it is delivered at the next door, to whom does the 9 s. 6 d. go?—To the Submarine Company.

8553. Sir C. Wingfield.] It is not charged at all, in fact, in that case?—If you were to send a message from England to Bombay by the submarine line, you would have to pay the same rate as if you sent it to Calcutta or to Madras.

8554. That charge has been raised?—It has been raised 2 s.; it was 7 s. 6 d., it is now 9 s. 6 d.; it was raised at the time that we raised the rate of charge to 4 l. 10 s.

8555. That is what you call a terminal charge, is it not?—You may call it a terminal charge at Bombay; but inasmuch as you pay the same amount for conveyance to Madras it becomes part of the rate.

8556. If a message is delivered in the town of Bombay that charge is not taken by the Government; but if it goes to Bycullah, or goes any distance on the wires, it is?—Yes.

8557. When you say that the British India Company accepted the offer of Government accommodation at Bombay with thanks, it was not till they had asked twice to have a local office assigned them and were refused, they were obliged to take what they could get?—That is not my recollection. I know that they did ask to have an office, but I can positively say that when Government offered them accommodation in their own office they accepted it with thanks. I do not say that they did not repent afterwards.

8558. But if they asked for an office of their own, surely they were not pleased with what they got, but accepting with thanks was merely a matter of courtesy?—I should say that anybody who read the correspondence between the Government and the company would come to a different conclusion; he would say that the company, in accepting with thanks what they then understood, to be offered them, were perfectly in earnest, and not using a mere expression of courtesy.

8559. Mr. Crawford.] In whose hands is the administration of the office of the company in India?—In those of the telegraph department of the Indian Government. The telegraphs all over India, in whatever presidency, are directly under a department of the Government of India.

8560. A message sent from this country, on its arrival in this office in Bombay, is in the custody and in the hands of the Government, and not of the telegraph company?—Just so; although it is quite true, with regard to a message delivered at Bombay, that the terminal charge is received by the company and not by the Government, nevertheless that message being received in the Government office is delivered by the Government servants in Bombay, not by the company's servants. I want to make an explanation with regard to an answer that I have given. When I said that the company accepted the offer with thanks, I guarded myself by saying

0.59.

that I did not say that they did not repent afterwards.

8561. Sir C. Wingfield.] But their application twice repeated was for an office of their own, and it cannot be assumed that they were glad to be put in the Government office instead?—They used language which would make anyone suppose, or would make me suppose at least, that they were glad.

8562. Mr. Fawcett.] I understood, from the drift of your statement, that you said that two-thirds of the expenditure which had been incurred on this Indo-European line has been thrown away; that the telegraph might have been constructed for one-third of the outlay?—I did not use that language, nor did I mean to convey that idea. What I said was, that I thought that the cable from Bussorah to Kurrachee would have sufficed by itself; but it has been supplemented by two additions; first, by a land line along the Mekran coast, and then by a line through Persia, which enables messages to get to Bushire instead of going to Bussorah. I spoke of the expense of the two portions. I would not call it two-thirds of the expense, because I do not recollect what the cable cost, and what the Mekran line, and so on; but I meant that I thought that the expense bestowed on the cable would have sufficed by itself for adequate communication with India. I by no means said that I thought that the money expended on the other two portions of the line was thrown away. Most assuredly it is not now, because one portion of that expense was applied to making the line through Persia, which works better than probably any line in the world, far better than the Turkish line did.

8563. Still I understand you that adequate telegraphic communication might have been obtained without throwing any financial burden on the Indian people, which the present telegraphic communication certainly does?—Yes, I think I may say so still. I think, as I said just now, that if we had confined ourselves to connecting the Turkish telegraph by a cable from Bussorah to Kurrachee, although the Turkish part of that line worked infamously, and the public would have cried out dreadfully, nevertheless the traffic on that line would have paid a very fair dividend, perhaps three, or four, or five per cent. on the outlay required, simply for that partial communication.

8564. Do you remember how much money was sunk in the first Red Sea Telegraph?—No.

8565. That money was absolutely lost by the Indian Government, was it not?—Half by the Government, and half by the British Treasury; and it was lost because that company was guaranteed; that is the long and short of it.

8566. You think that if the guarantee had not been given, the line would have been constructed more carefully?—I do mean that.

8567. You, in principle, object to this plan of Government guarantees?—I do, generally; but I think that it need not have been inferred from what I said.

8568. You think that that was a very serious loss, a very large sum of money?—It was more than a million, I think.

8569. We are to understand that you think that really the primary motive cause of that loss was the fact that Government guaranteed a dividend?—I have no hesitation in saying so, and I will at once explain what I mean. For

3 E 3

certain

Mr. W. T. Thornton.

Mr. W. T.
Thornton.

27 June
1871.

certain portions of the line that cable was suspended from rock to rock; I mean to say, that supposing there was one rock here and another rock at some distance off, the cable, instead of being allowed to fall to the bottom and lie along the bottom of the sea, was suspended from rock to rock, and left to break by its weight; the object of the contractor being to use as little cable as he possibly could, knowing that if he could only form the line, however badly, the 5 per cent. would have to be paid for ever and a day by the two Governments. Now, about what I am saying I am quite positive. I was assured by the engineers that that was the fact, and it is inconceivable that any but a guaranteed company would have done that.

8570. Then, putting it in another point of view, I presume that you would agree with this opinion, that as money can be borrowed in England at less than 5 per cent., if you guarantee a company at 5 per cent. you destroy all security for economy and efficiency, and almost give them an inducement to spend as much money as possible?—To a very great extent I certainly do entertain that opinion; there is no one in the world more opposed to guaranteed companies than I am.

8571. What I point out would rather indicate the nature of your objections to the principle?—Just so.

8572. Did not the demand for the benefit of this Indo-European Telegraph partly come from the British public, and also does it not confer almost as much service on England as on India?—I should say that it confers quite as much benefit on England as on India; in one sense I should say the greater part of it is English, because I suppose that the messages pass chiefly between Englishmen in England and Englishmen in India.

8573. Therefore you would say that it really was of more importance to the English community almost than to the Indian community?—I think you must not leave out of sight the political advantages of the telegraph.

8574. Still we may assume that we derive political advantages from anything affecting beneficially the Indian people?—Decidedly.

8575. Therefore, as the telegraph has turned out hitherto a disastrous financial speculation, would it not have been fair that a portion of the risk and loss should have been borne by England?—I should have said so decidedly.

8576. Supposing that you have that opinion, what power have you of officially communicating an opinion when any expenditure is going to be incurred, that the whole of it should not be incurred by India?—I suppose that the representation would be made to the Lords of the Treasury; but we should know beforehand what would be the result. They would simply say that the Lords of the Treasury would not hear of it, and that they had nothing to say to it.

8577. At the present time there are a great many expenses incurred in India which are not simply for the benefit of India, but also benefit England equally as much, but there is no chance that England will contribute her fair share, as I understand you?—Not unless proper pressure is brought to bear upon the British Government.

8578. And speaking at the present time, there is little or no chance that such pressure will be brought to bear?—I should have thought that the asker of that question could give a better

opinion than I can on that point; judging from experience, I should say that there is not the smallest chance of any fair treatment of the interests of India where the interests of England come into opposition to them.

8579. That any communication addressed by the India Office to the Lords of the Treasury would have little chance of being taken any notice of, and that, considering the state of public opinion in England towards India, there is little chance of any pressure being brought to bear on the Government from outside?—That is my own individual opinion, but merely my own individual opinion.

8580. You can speak as to the expenses incurred in England for telegraphic stores?—I have no doubt I could ascertain them without any difficulty.

8581. Does that come under your official cognizance?—In this sort of way; any requisition for stores from India would come in the first instance to me.

8582. Then who is there to check and to test these requisitions; suppose that you received from India a requisition for a certain amount of stores, and you thought that the stores were more than were required, or that they asked for too expensive stores, is there any control exercised on those requisitions at the India Office?—It would be altogether out of my province; but what would be done in such a case would be this; I should send the requisition to the Director General of the Store Department for his report upon it, if he thought his opinion desirable on any point. Very often he replies that there is no occasion for all these stores; or he might suggest that this should be substituted for that, and then he returns this report to me, and I place his recommendations before the committee, who adopt or reject, as they think proper, what he has proposed.

8583. Does it frequently happen that requisitions come from India for stores, and that they are considered so unnecessary that the Secretary of State for India in Council, or the committee to which you refer, refuses to execute the order?—They very frequently indeed adopt the recommendation of the Director of Stores that a smaller quantity shall be sent.

8584. What plan is adopted for testing the quality of the stores that you buy, and for securing that you obtain them, considering their quality, at the lowest possible price?—With reference to the first question, that is of course out of my province altogether; that is a duty which belongs to the Director General of Stores, and he has his own responsible staff, or makes his own arrangements; and I do not know more than anybody else about them. But with regard to the second question, the security that there may be for stores being obtained on the lowest terms, there is this: you must understand that the director of the store department has no power of his own; he can only act by authority, namely, by the authority of the Secretary of State in Council; he makes his proposals to them, and they adopt or reject them as they think proper. As we are particularly talking now of the telegraphic stores, an indent or requisition comes from India, we will say, for a certain amount of telegraphic stores. I believe that with regard to stores in general, the rule is that open competition should be invited, that anybody whatsoever should be invited to tender.

8585. That

8585. That is not the case with regard to beer?—We have nothing to do with beer in the Public Works Department; and even on the general question I am not speaking very confidently, because it is not my business; but my impression is that the rule is, that the competition shall be open; but there are a great many exceptions, and more particularly with regard to telegraphic stores. Now, there are very few manufacturers of telegraphic stores; of telegraph cables, I believe there are not more than one or two; and although of insulators the manufacturers are more numerous, there are not, I fancy, more than four or five who can be safely depended upon. I do not think myself that there are more than two; but there are several who profess to make insulators; and on previous occasions there has either been complete open competition, or a good many have been invited to send in tenders. The consequence is (and this is the complaint of the telegraph department in India), that we give an order to a man to provide a certain number of insulators, because he has sent in a low tender, and we either do not get them at all, or not for long after they are wanted, because the man has not adequate means for performing his contract; and only recently we got a memorandum from the Government of India requesting that we would not do anything of the kind; but always divide these orders among a few selected firms. I laid this recommendation before the Public Works Committee, and the Public Works Committee rejected it; they said that the rule was open competition, and that they would judge every case by itself; they would see when the occasion required whether they should limit the competition to three or four firms; but they would not lay down the rule that only a certain number of firms should be allowed to compete.

8586. If you have had in the India Office frequently to check, or to complain of the orders which have been sent home from India for telegraphic stores, as being unnecessary in amount, have they not also made corresponding complaints, and said that many of their orders have been issued at an extravagant price?—As regards the first part of your question, I am not sure that that has ever happened with regard to telegraphic stores; I meant stores in general. I do not recollect a case of an indent for telegraph stores coming home in excess; I will not say that there never has been one, but I do not recollect one. With regard to the other matter, I do not recollect any complaint on the part of the Government of India, that we sent out unduly expensive stores; they very often complain of delay in their being sent out.

8587. But if any complaint had been made with regard to the price that you paid for them, would that come under your department?—If it related to public works, stores, or telegraph stores, it would come to me.

8588. Mr. Birley.] You complain of the guarantee given to the original Red Sea telegraph; was not that on the same principle as the guarantee to the Indian railways?—I was speaking with no personal knowledge on the subject.

8589. I mean generally, was it not so?—I believe it was the same thing.

8590. And do you believe that those railways in India would have been made without those guarantees?—It is an opinion that I am almost singular in, but I do entertain the opinion strongly, that they would have been if a pro-

per course had been pursued on the part of the India Government.

8591. What course would you recommend?—I cannot doubt that the same Government, by virtue of whose credit alone guaranteed companies are able to raise money, by its own credit could have raised money.

8592. How would you have recommended that the original telegraph to India should have been carried out, instead of the guarantee of 5 per cent.?—In a case of that kind I certainly would not have trusted a contractor, because I should have felt that it was the business of a contractor to do it as cheaply as he could, unless the contractor would have guaranteed the permanence of the cable after it was laid.

8593. Speaking of the delay in the execution of indents from India, you impose, do you not, heavy penalties on delay beyond the time that you yourselves specify?—I would rather not answer those questions, because I am not responsible for those matters.

8594. Mr. Candlish.] Speaking of the telegraphic communication between India and England commercially, have we not impoverished ourselves by multiplying it needlessly?—I should say that undoubtedly, if we could have foreseen what we now know, it would have been unwise to do what we have done; unwise, that is, to have spent the money in establishing a communication between England and India that we have spent; we could have established all that was requisite for a smaller sum.

8595. Would one telegraphic communication with India have been sufficient to do the work?—No, I do not think that it could be trusted. I think that it would be a great pity indeed if either the Indo-European line collapsed, or that of the Red Sea Company. The fact is that there is no year in which one or the other does not become interrupted, during which interruption the country would be without any communication with India if the other line did not exist.

8596. Could we have protected ourselves from the inconvenience of this interruption with fewer lines, taking the whole of our telegraphic communication between Europe and India?—I should say, undoubtedly, it would not be safe to trust to one line.

8597. The line through Turkey paid previous to the Red Sea being constructed, did it not?—It paid 1½ per cent.; I am speaking of our part of the Persian Gulf cable, which was connected with the Turkish line.

8598. How did we get pledged to the Turkish Government to carry on a second line to India?—I really do not know. When I took charge of the Telegraph Department, which was some ten years ago, I found that we had contracted that pledge; but I had not time to go into the antiquities of the subject. I know that it was universally admitted that we had committed ourselves to the Turkish Government.

8599. Who could inform the Committee on that subject?—I have no doubt that the office correspondence would give the information.

8600. That second line you would not have constructed except for that engagement?—You mean, as I understand you, the connection between the Turkish telegraph ending at Bussorah, and Bombay; I do not say that I would not; I would not have established the communication so expensively; what I mean to say is that we had

Mr. W. T. Thornton.

27 June 1871.

Mr. W. T.
Thornton.

27 June
1871.

no choice or were considered to have no choice in the matter.

8601. Because of some pledge which we might or might not have entered into?—Which we certainly need not have entered into.

8602. And you think that it was desirable to construct that line, notwithstanding that it will always be worked at a loss?—I do not think that I ever said that, or those words must have had something which came before them which rather qualified their meaning; I rather think I said that the Turkish line would have paid if there had been no line to compete with it.

8603. What is the ground of the 9 s. 6 d. charge in India, upon all messages delivered in India?—It is the through rate which we charge for the conveyance, through any part of India, of messages coming from abroad to India.

8604. Do you approve of the policy of that uniform charge?—I do not think I am competent to form an opinion on that.

8605. It is not charged if the message is delivered inside Bombay?—It is charged, but not received by the Government; I said that at this moment, although charged, it is not received by the Government, but is received by the company; but when I said that, I laid great stress on "this moment." The fact is, that the Government of India have given notice that, from the 1st of July, they mean to take that money themselves.

8606. Sir C. Wingfield.] In what way; will they deduct it?—They do not mean to let the company pocket it, but to pocket it themselves.

8607. Mr. Candlish.] At present the company get 9 s. 6 d. more for a message to Bombay than for one to any other part of India?—No, it is exactly the same; that is to say, a message brought to Bombay by the Red Sea Company's cable pays for delivery in India precisely the same sum whether it is delivered at Bombay, or at Cape Comorin.

8608. But delivered in Bombay; the company get the 9 s. 6 d.?—Up to this moment they do.

8609. They therefore get 9 s. 6 d. more for a message to Bombay than for one to any other portion of India?—They do; you are quite right in that.

8610. Do you know the ground of that?—Simply that the Government have allowed them hitherto to pocket the terminal charge.

8611. By an agreement?—No.

8612. The Government has power to terminate that arrangement?—Yes, they consider so certainly; I believe that it has been done by mere inadvertence on the part of the Government, but I cannot say.

8613. Did I rightly understand you to say to the honourable Member for Brighton, that you would absolve India from the consequences of these telegraphic financial failures?—I never meant to say anything of the kind. I think what the honourable Member for Brighton asked me was, whether I thought that England ought not to have shared the expense; to which I said, yes.

8614. Did you not say that the loss sustained should have been paid in larger proportion by England, in consequence of the messages being in a larger proportion to and from Englishmen?—I think that then the honourable Member for Brighton was asking me whether the telegraph

was more beneficial to England than to India, and I said that in one sense it was more beneficial to England.

8615. You do not think that there is anything now to complain of in the allocation of the charge between England and India?—I think that is past praying for.

8616. Why should it be that India should send home to England requisitions for stores more than England thinks it needs?—It is a mistake on the part of the indenting officer, I suppose.

8617. Will not the authorities in India be the best judges of the necessities of India?—I think that all men are liable to make mistakes, whether in England or in India. The mistake is generally discovered in England, in this way; the Director General of Stores, who receives this indent, says, "Why, you are sending home an annual indent, but we sent you over such a quantity such a time ago; you surely must have so much in store that you cannot require an additional supply."

8618. But is not the officer in India the man to know best what he has and what he requires?—It depends upon circumstances.

8619. What circumstances?—Whether he has properly examined into the matter.

8620. You have officers in India then who do not examine?—I believe there is no country in the world in which officers are not fallible.

8621. Mr. Eastwick.] You said that the line through Persia would never pay, and that it was quite impossible that it ever should pay; what do you base that statement upon?—There is no local traffic, I think. What really I based that statement on was the very great amount of the working expenses. I cannot conceive any increase of Persian traffic, proper which would ever cover the working expenses, and yield a surplus over and above them, because now, although we are receiving some thousands a year, that is merely in diminution of the working expenses which we have to pay.

8622. But perhaps you are aware that there is a local traffic growing up, and that the merchants of Shiraz have offered, in fact, to our Director General to pay the expenses of the line to Bunder-Abbas?—I did not know that; I thought myself that the local traffic was carried by local lines.

8623. But supposing that the system was to be developed, and to be carried out to Yezd, and to other places, do you think, then, that probably the local receipts would increase very much, and might help to balance the expenses?—I think you are a better judge than I am as to that. The only thing that I based my statement on was the excessive deficiency that there is now. The working expenses are so very much greater than the receipts now that I meant there was no prospect of their ever being covered by the profits.

8624. Be that as it may, it is quite clear that no private company could ever have undertaken the line through Persia; I suppose you would admit that?—Certainly.

8625. And I suppose you would consider that it would be impossible for a private company to carry it on?—They could not bear the expense, even if they got it for nothing.

8626. So that if there are any political advantages which compensate for the expenditure, the line must have been made by the Government?—It must be maintained by the Government. I think that is an excellent reason why we should not withdraw from our connection with Persia, although

although we maintain it at a large expense. Now that that has been reduced by something like one-half, it may well be worth while to lose something, 10,000*l.*, or less than that, for the sake of that political influence which we do exercise in Persia.

8627. *Mr. Haviland-Burke.*] When you say "we," you mean this Government equally with the Indian Government, I suppose?—I mean the Government of the British Empire.

8628. *Mr. Grant Duff.*] Will you give us, in the fewest possible words, some account of the telegraph receipts in India, and confine yourself as much as possible to explaining to the Committee how far the telegraph lines may be expected to be eventually self-supporting, and how far they cannot be expected to be self-supporting, avoiding all collateral points?—I have got the receipts on India lines proper for the year 1869–70; but all my other information is for the previous year, 1868–69; and the differences between the receipts for the year 1869–70 and those for the previous year are so small that it may be better, for the sake of comparison, to keep to the year 1868–69. Now in the year 1868–69, in round numbers, there were 14,000 miles of telegraph open in India. In round numbers, their total cost (not, of course, adding to it arrears of interest, but exclusive of arrears of interest) was 1,800,000*l.* The total charge for the year was 202,554*l.*; that is to say, the total expenses of maintenance and working the line, and charges of all kinds, except interest on capital; the total revenue was 120,887*l.*, leaving a net excess charge of about 81,667*l.* I think that I have now answered the question, except saying that the Director General of Telegraphs considers that the rates in India are exceptionally low, and that therefore they would bear enhancement.

8629. But can you express any opinion as to the probability of the receipts from the telegraph increasing?—I see that they do rise from year to year. I have got here the receipts from the year 1850 to the year 1869, and they have increased every year, not quite regularly, but they are higher now than they have ever been before, and higher this year than last year. For instance, I gave the receipts for the year 1868–69 at 120,000*l.*; for the last year that we have any record of, namely, 1869–70, they are 129,000*l.* They increase every year; but that does not mean much, because the fact is that the mileage increases too.

8630. Will you just give the rates?—I have not got the rates with me.

8631. *Sir C. Wingfield.*] Will you explain more clearly about that 9*s.* 6*d.* rate; you said, I think, that the British Indian Company had hitherto kept the 9*s.* 6*d.*, but that from the first of July it is the intention of the Government of India to take that money?—Yes.

8632. That intention of the Government of India is under the consideration of the Home Government, is it not?—Well, I think that the Home Government has decided, at least I fancy it will decide to-morrow, not to interfere with the action of the local government.

8633. Is it not the case that their taking this sum will fall more heavily on the British Indian Submarine Company than on Siemens's Company, because the latter stops at Teheran?—Of course it will not affect them in the least.

8634. Therefore the Submarine Company will

be weighted relatively to Siemens's in respect of this charge?—On the contrary, the Submarine Company have a great advantage over Siemens's in respect of any message, and this does not in the least affect the Indo-European Company; it affects us. This is what we have hitherto done; we have not charged any terminal rate at Kurrachee up to this time; it really did so happen up to this time that a message sent to Kurrachee was 9*s.* 6*d.* cheaper than a message two miles out of Kurrachee; we did not charge it there, but at Bombay the charge was made, but not by us. Now we are going to charge it both at Kurrachee and at Bombay, and to take it ourselves.

8635. *Mr. Crawford.*] Can you give us the distribution of the 90*s.* for each message?—Major Champain gave that.

8636. *Sir C. Wingfield.*] At Kurrachee who pays it; the Persian Gulf Cable will have to pay this 9*s.* 6*d.*, I suppose?—It will be paid by the sender of the message. Such messages as do go to Kurrachee and stop there (there are almost none of these), will no longer have the exemption that they previously had. Hitherto those persons at Kurrachee, who have either sent or received messages, have had that advantage over the rest of India.

8637. *Mr. Crawford.*] If I send a message to Bombay at the cost of 4*l.* 10*s.*, the receiver now has nothing to pay?—No.

8638. Will he have 9*s.* 6*d.* to pay in future?—No. You send a message to India by the Submarine Company, and you pay 4*l.* 10*s.* for it; that is all you have got to pay, and all that ever is paid; 4*l.* 10*s.* is received at Bombay, but whereas 9*s.* 6*d.* of this has hitherto been received by the company, it will hereafter be received by the Government.

8639. On what principle is that 9*s.* 6*d.* arrived at?—It is the through rate, the rate that we charge for the conveyance of any ex-Indian message, if I may say so, any message which comes to India from outside India; the charge of the Indian Government for the conveyance of it through India.

8640. Do you mean that they are going to charge 9*s.* 6*d.* for the delivery of a message at the next house?—I mean to say that. They charge the same rate to Cape Comorin or to Bombay.

8641. Do you justify that on any ground?—On the ground of uniformity. As the Committee have seen, the Indian telegraphs are maintained by the Government for the benefit of the country at a very great expense, and therefore the Government, I should say, are perfectly justified in putting on any rate which will enable them to cover the expense.

8642. *Mr. Curc.*] But if you happen to live close by you will get less for your money?—That is your misfortune; if you go to Calcutta you will get the advantage.

8643. *Sir C. Wingfield.*] Will the local rates remain the same to senders of messages in India?—The local rates, it seems to me, are too low, and the Government of India are seriously thinking of raising them.

8644. The other day, by agreement with the Government, the British Indian Company and Siemens's Line raised their rates to 4*l.* 10*s.*?—Yes; but I think that you are putting the cart before the horse; the way in which I should put it is this: that the Indian Government, following

Mr. W. T. Thornton.

27 June
1871.

Mr. W. T.
Thornton.

27 June
1871.

the example of those two companies, raised its rates; the fact is that they, without our concurrence, raised their rates to 4 l.

8645. And you made them raise them to 4 l. 10 s.?—They raised their rates, and we told them that they were doing an illegal thing, and we did not think that we could do it according to the terms of the Vienna Convention; but we were informed by the Berne Office (which represented the Vienna Convention), that if we pleased, we, being parties to that particular line; could by agreement with the other parties to that particular line raise the rates. Upon that we said, "Now we are quite content to raise the rate, on condition that we as well as you have a fair share of the increase."

8646. The fact was, that while they were satisfied with 4 l., the Government of India made them fix it at 4 l. 10 s.?—No doubt they were satisfied with 4 l.; but it was not to be supposed that we should be. There was a 2 l. 17 s. rate, of which we got a proportion, and they got a proportion. They added to their own shares, making the entire rate 4 l., and diminishing the number of messages. We would not agree to that. We said, "If it is raised at all, it must be raised so that we shall have a share as well as you."

8647. Mr. Crawford.] The first turn of the screw came from the British Indian Company, did it?—It came from both of them, so far as we were concerned; they told us that they intended to raise their rates, and asked us to authorise the levy of those rates in India. We simply refused. We said, "This is quite illegal, and we shall not do anything of the kind"; they did it in England in spite of us, but in India they could not do it without our concurrence, and we would not concur.

8648. Sir C. Wingfield.] So that at all events the Indo-European Company will get the whole of the advantage of this 4 l. 10 s.; it will not suffer that diminishment of 9 s. 6 d.?—The Sub-Marine Company gained amazingly by that rise, infinitely more than the Indo-European Company did. Observe what was done; the 2 l. 17 s. was raised to 4 l., and then by that, the Red Sea Company got 1 l. 3 s.; we insisted, as they call it, on its being raised to 4 l. 10 s. What effect had that on them? that, whereas they got 1 l. 3 s., they now get 1 l. 13 s. -

8649. And Siemens's line got a still larger proportion?—No, Siemens's line does not benefit by the increase from 4 l. to 4 l. 10 s.; he would be glad if we had remained at 4 l.; the additional 10 s. was taken by ourselves; they had raised their rates and got their share.

8650. You only raised the Persian Gulf rate by 8 s.?—But then we added 2 s. to the Indian rate. That through rate, of which you have been asking, was 7 s. 6 d. before this charge took place, and now it is 9 s. 6 d.

8651. Mr. Fawcett.] I understand from your figures, that looking at the telegraph in India, considering it simply as a financial question, and looking at the direct financial result, the Government has spent 1,800,000 l. to realise an annual loss of 142,000 l.?—If I made the annual loss so high it was by mistake. The real loss is about 81,000 l. annually.

8652. Does that include the interest on capital?—No, it does not; the interest on capital is exclusive; you must add 66,000 l. for that.

8653. Then that 1,800,000 l. has been chiefly

borrowed, has it not?—It is impossible to say what has been borrowed; the Government of India borrows every year; what part of its expenses it pays with borrowed money no one can say.

8654. The interest on 1,800,000 l. at 5 per cent. is 90,000 l., is it not?—I should have said so too; but I see that they have put it down themselves in those figures which I have copied at 5 per cent., 66,000 l.

8655. But that must evidently be a mistake?—No doubt it is.

8656. Therefore as they have been constantly borrowing it is fair to assume that the telegraphs have been partly carried out by borrowed money?—I think it perfectly fair to assume that, if you recollect this assumption in any subsequent assumption that you may make, and if you will deduct this and imagine that this has been borrowed, and that therefore so much less has been borrowed for other purposes.

8657. Then the real financial result would be, adding this interest (because whether borrowed or not, you are bound to allow interest on it), an annual loss of something like 230,000 l.?—Adding 90,000 l. to 81,000 l. the total will be 171,000 l.

8658. By whom are the telegraphs in India chiefly used?—I can give you some sort of idea, for I have got here an account of the description of messages. I have got the number of messages sent in that particular year that I gave you, the year 1868-69. The number of private messages was 333,856; the number of service or Government messages was 40,000; the total was 374,000.

8659. But we may argue from analogy (I suppose it is a fair supposition), that the telegraphs as in this country are a company to a great extent enjoyed by the rich rather than by the poor?—Yes, but not necessarily the English rich; it may be native rich.

8660. But I mean that they would be used generally by the English and native rich?—By the well-to-do people, undoubtedly.

8661. Then do not you think, that considering that this loss of 238,000 l. has to be supplied by the general taxation of the country, which taxation has to be supplied by the great mass of the people, as a matter of justice the charges ought to be so raised as, if possible, not to throw any annual loss upon the mass of the people?—With that qualification of "if possible," I should agree with you completely; but I am afraid that the effect of raising the charges with the intention of raising a revenue, such as would not only pay the expenses, but yield a dividend, would be to put a stop to traffic. Now, if that were done, and the telegraph could not be maintained, then we should lose another advantage which is well worth maintaining, even at an enormous expense; we should lose the political advantage; we should lose the power which the Government now has of obtaining information from, or sending information to, any distant part of the country; and I am not speaking merely of the importance of such facility in time of war, but even in time of peace; for instance, if there were a famine in Rajpootana, or in Orissa, it would be of incalculable importance to the Government that it should have the means of immediate communication with these places, and it would be a most deplorable thing, that for the sake of saving 80,000 l. a year they should not have it.

8662. This

8662. This is what I want to arrive at; whether you do not think that the financial position of these Indian companies would be improved by raising the charge for messages?—You mean the Government telegraphs; it is not for me to give an opinion on the subject, but I believe that the Telegraph Department in India thinks that the rates will bear raising. The fact is, that they lowered them recently experimentally, with the desire of seeing whether the traffic would increase in proportion, and I think they have been disappointed, and they are considering now whether they will not raise the rates in order to make the telegraph more remunerative than it is. I do not believe that the telegraphs will be remunerative for a very considerable time to come.

8663. You think it will always result in a very heavy loss?—I cannot tell.

8664. Are all the telegraphs in India constructed by the Government?—All, except those along the lines of railway.

8665. And do those pay?—Certainly not.

8666. Have they been conducted simply as a speculation, or in any case has a guarantee been given in India?—A guarantee has been given in no case.

8667. Do you think that any part of this disastrous financial result, which the figures show, is to be attributed to extravagant expenditure in the construction?—I am no very good judge, but I have just made this calculation: there are 14,000 miles of telegraph in India open now, and in round numbers they cost 1,800,000*l.* to construct; that, I think, is at the rate of 120*l.* a mile. I do not know what the expense of material is, but it does not strike me as being a large sum, considering that it is India and not England, and considering that the materials have to go from England.

8668. You are not aware of any official paper that refers to extravagant expenditure in the construction?—I have never seen such a statement as that; I have heard plenty of complaints of the inefficiency of the Indian Telegraph a few years ago, before it got under its present management, but I never heard any complaint of its having been constructed at an extravagant expense; now, I believe it is generally admitted that the working is exceedingly good.

8669. But in all these telegraph accounts, you do not get a fair financial result, because you get gentlemen employed, do you not, who derive a portion of their salary from some other source; and that is the case not only with reference to telegraphs, but with reference to all the public works in India, is it not?—If they happen to be military men; in that case I really am not quite sure, whether the military pay is charged to the Military Department or not; I do not think it is, but whether it is or not it is really not of much consequence, because the military pay of a man in the Public Works Department is only a small portion of it, because any officer in the Army is so miserably paid.

8670. Taking a staff officer of high rank, his pay is considerable, I presume, and he is drawing his pay from the Army, is he not?—In the Public Works Department (which is the only department for which I am competent to speak) if he got military pay, his Public Works pay would be reduced proportionately.

8671. But then that comes to the same thing?—No; what I mean to say is this, that a civilian who entered the Public Works Department would

receive larger pay from the Public Works Department than a military man who occupied the same post, and discharged the same duties, and received military pay.

8672. That is exactly what I want to bring out; for instance, Mr. A. is a civilian employed in the telegraph department, and Colonel B. is a military man employed in it; they are men of equal abilities and perform services of the same value; Mr. A., because he is a civilian, receives 3,000*l.* a year; Colonel B. also receives 3,000*l.*, but he gets 1,500*l.* a year of that from the Public Works Department, and 1,500*l.* from the army?—I should say you are very wrong about the proportions, but I cannot give them exactly. The one would get 3,000*l.* entirely from the Public Works Department, and the other would get perhaps 2,700*l.* from the Public Works Department; getting only his military pay from the Military Department. Observe that it is his mere military pay that he gets, not his military pay and allowances; his military pay would be some trifle in comparison to his salary.

8673. But whatever it is, it is a fact that there are a great many officers employed in the telegraph and other public works departments, and they receive a portion of their pay, whether larger or smaller, from the army, do they not?—Yes; but it is really not an item worth taking into account.

8674. Mr. Birley.] Is the telegraph system in India considered pretty complete, or are large extensions contemplated?—I think I can answer that question by this map, which shows at a glance how India is covered with telegraphs (*holding in a Map*); those red lines are all telegraphs; there are 14,000 miles opened.

8675. I conclude that there is great economy in moving troops and in carrying on the government of the country in consequence of the telegraph?—There certainly ought to be.

8676. Can you tell me whether there has been any special expense in India beyond other countries in laying down the line?—I am now speaking not at all with any accurate knowledge, but my impression is that in the first instance when the telegraphs were first established in India, they were laid down with marvellous cheapness; they were laid down by Sir William O'Shaughnessy, with marvellous cheapness.

8677. Why has that cheapness not been continued?—I think it was a makeshift system; it was very inefficient; it did very well then; the great thing was to establish a telegraph system all over India as quickly as possible, and comparing it with the nothing that existed before, it was done very well. Everything, however, has had to be renewed and done over again.

8678. The timber has to be brought from England?—Not the timber; the iron posts have.

8679. Mr. W. Foyler.] May I ask what is the rate from Bombay to Calcutta?—If it is a message which comes from outside India it is 9*s.* 6*d.*; if from Bombay to Calcutta, originating at Bombay, it is very much cheaper, namely, 1 rupee for 10 words.

8680. Mr. Crawford.] If the British Indian Company had had an office and a delivery of its own at Bombay, would the Government then have claimed to take the 9*s.* 6*d.*?—They would not have allowed them to deliver; that has always been a bone of contention between the company and the Government, and the company have

Mr. W. T. Thornton.

27 June 1871.

Mr. W. T.
Thornton.
27 June
1871.

always insisted on the right to deliver, and the Government have always refused it.

8681. Mr. *Grant Duff*.] Is it not the case that every telegraph company that lands a cable in any country is charged a certain sum under the title of terminal rent?—I am assured that, without any exception, it is the case.

8682. Sir *C. Wingfield*.] Except in England?—Yes; a post office charge is made for the messages of the Submarine Company; and my authority for that is a letter received yesterday from the Secretary to the Submarine Company.

8683. Mr. *B. Denison*.] Is the telegraph now throughout India in, what we may call, its permanent condition?—It is in process of improvement.

8684. Mr. *J. B. Smith*.] Would you not say that even if the electric telegraphs produced nothing to the Government, in the present condition of India, it is indispensable that they should have telegraphic communication?—Certainly; they are worth paying 80,000 *l.* a year for.

8685. In fact the Government could not do without them in the present state of things?—Certainly not.

8686. Is it not likely as the resources of the country develop, and trade extends in different parts of the country, as it is doing every year, your telegraphic communication will extend and bring in a larger revenue?—Eventually undoubtedly; it is improving every year.

8687. It is likely to be a slow improvement?—Yes.

8688. And probably you may find that by extending your lines in some other directions, you may get greater profits than at present?—Yes; but even as the lines are the receipts will increase.

8689. They are indispensable, and the only question is whether they are worked economically, and that is the business of the Government to attend to?—Yes.

8690. Mr. *Fawcett*.] You have said that the revenue from the telegraphs in India was gradually and steadily improving; do you mean simply the gross revenue, or do you mean the revenue when you deduct all the working expenses?—There is an excess of working expenses beyond revenue; there never has been any net revenue.

8691. But is it not the fact that up to the present time there has been really no improvement in the revenue; that the working expenses have increased even at a faster rate than the receipts?—Here I have got the charges of all kinds, exclusive of interest, per mile of line from the year 1850 to the year 1865; and I think it will be worth my while to read this, as it will show you all the expenses of maintenance as well

as of working. I will give you the charges per mile of line; I suppose I may leave out the decimals. In the year 1850 they were 6 *l.*, and the revenue 7 *l.*

8692. In that year there was a surplus therefore?—Yes, but at that time there were only 83 miles of line. In the next year the charges were 18 *l.*, the revenue, 22 *l.*; in the next year the charges, 30 *l.*; revenue, 25 *l.*; in the next year charges, 27 *l.*; revenue, 1 *l.*; the explanation of that is this; in the year 1853-54, when the charges were 60 *l.* a mile, and the whole of the revenue was 25 *l.* a mile, there were 91 miles open. Then the next year, there were 3,253 miles open, and then the charges fell to 2 *l.* a mile, and the revenue to 1 *l.* a mile, or rather to 1, decimal 99, nearly 2 *l.*; then in the next year, the charges were 8 *l.*, and the revenue 6 *l.*; in the next year the charges were 11 *l.*, and the revenue 7 *l.*; in the next year the charges were 9 *l.*, and the revenue, 6 *l.*; in the next, charges 10 *l.*, revenue, 5 *l.*; in the next, charges 10 *l.*, revenue, 4 *l.*; in the next, charges 12 *l.*, revenue, 5 *l.*; in the next, charges 12 *l.*, revenue, 6 *l.*; in the next, charges, 11 *l.*, revenue, 6 *l.*; in the next, charges, 11 *l.*, revenue, 7 *l.*; in the next, charges 11 *l.*, revenue, 6 *l.*; and in the next, charges 12 *l.*, revenue 8 *l.*

8693. From those figures you cannot bring out any general result; can you; they vary so that you cannot, as a matter of fact, deduce any result from them?—You would like, I presume, to have the balance of charges for each year, and see how it increases; the difference between receipts and expenditure; I will give it you in round numbers. In 1851-52, 60 *l.* is the balance of loss; in the next year there was a gain of 17 *l.*, and that was the only year in which there was a gain. In the next year there was a loss of 3,400 *l.*; in the next there was a loss of 6,600 *l.*; in the next there was a loss of 19,000 *l.*; in the next there was a loss of 27,000 *l.*; in the next there was a loss of 31,000 *l.*; in the next there was a loss of 58,000 *l.*; in the next there was a loss of 79,000 *l.*; in the next there was a loss of 107,000 *l.*; in the next there was again a loss of 107,000 *l.*; in the next there was a loss of 90,000 *l.*; in the next there was a loss of 86,000 *l.*; in the next there was a loss of 115,000 *l.*; and in the next there was a loss of 113,000 *l.*

8694. Then those results show that there has been a steady increase in the loss?—Certainly, they show, not a steady increase, but that there has been an increase.

8695. With an interruption, the increase in the loss has been steady and gradual, has it not?—I should say decidedly not. In 1860-61 it was 107,000 *l.*; and so it was in the next year; then in the next year it was 90,000 *l.*; and then 86,000 *l.* In the following year it gets to 115,000 *l.*; and in the last it falls to 113,000 *l.*

Friday, 30th June 1871.

MEMBERS PRESENT:

Mr. Ayrton.
Sir Thomas Bazley.
Mr. Beach.
Mr. Birley.
Mr. Bourke.
Mr. Candlerish.
Mr. Cave.
Mr. Cross.
Mr. Charles Dalrymple.
Mr. Bockett Denison.

Mr. Grant Duff.
Mr. Eastwick.
Mr. Fawcett.
Mr. Lyttelton.
Mr. McClure.
Sir Stafford Northcote.
Mr. J. B. Smith.
Sir D. Wedderburn.
Sir Charles Wingfield.

THE RIGHT HONOURABLE ACTON SMEE AYRTON, IN THE CHAIR.

KAZI SHABUDIN, called in; and Examined.

8696. *Chairman.*] Will you be good enough to state what part of India you have resided in, and what has been your occupation?—I have resided in the Bombay Presidency, and was employed principally in Guzerat, in the Revenue Department, first as a mamuldar or tehsildar, and subsequently as a deputy collector and magistrate.

8697. How long is it since you left India, and came to this country?—I left India in July 1869, and have been in this country ever since.

8698. *Mr. Eastwick.*] I think that you have received titles from the Government for your services?—While I was tehsildar I received the title of Khan Sahib, and when I was deputy collector I held the title of Khan Bahadur, which is an official title.

8699. You were employed also in the secretariat at Bombay, were you not?—Yes, I was nearly two years there as a superintendent in the Revenue Department.

8700. Could you state the dates at which your appointments took place?—From April 1862 to, I believe, April 1864, I was in the Secretariat as a superintendent in the Revenue Department; and from May 1864, for about two years, I was tehsildar in Ahmedabad, and after that I was appointed deputy collector, which appointment I resigned in December 1868.

8701. Were you deputy collector at Ahmedabad?—In Surat.

8702. Then you have had great opportunities of seeing the collection of the land revenue, I suppose?—Yes, the collection of the land revenue was my chief duty.

8703. What is your opinion as to the rates of assessment at present?—It is extremely difficult to say what the present rates of assessment are; they vary from a few annas per acre to, I believe, 14 rupees per acre in Guzerat, but I have got an average by dividing the land-tax collected in 1868-69, by the number of cultivated acres, and

that gives me 2 rupees 4 annas. I think that may be taken as the average on all sorts of land throughout Guzerat. In the Deccan, by the same process, I arrive at 15 annas 1 pie per acre. This is exclusive of the local fund, which is 1 anna per rupee of the collected revenue.

8704. Are you aware of the fact stated by a preceding witness, that in one of the Pergunnahs at Sopah 26 rupees per acre is paid?—I do not think that there is anywhere in Guzerat so high a rate as 26 rupees per acre. I was not employed in Sopah; but I do not think that that can be correct. Fourteen rupees per acre is the maximum limit, I think.

8705. Then, taking the average, you do not think that the present rates of assessment are too high?—I do not think that the present rates of assessment are too high; but I think that the produce per acre is very low.

8706. Will you explain why you think so?—Taking bajree, which is the staple food in Guzerat, and more largely cultivated than any other product, I find 26½ rupees to be the produce of one holding such as Government recognises (these holdings are subdivided among families, but Government recognises larger holdings than they often actually are), taking the average holding to be eight acres, and the yield at the rate of 1,000 lbs. per acre, and taking the price of bajree at 30 lbs. per rupee, which I find to have been the case in 1867-68, an average good year. From that we have to deduct the Government assessment and local fund, which amounts to 19 rupees 2 annas; the price of seed, deterioration of live-stock, implements, and other expenses of culture, exclusive of the labour of the cultivator and his family; all of which, at a safe estimate, amounts to 67 or 68 rupees; deducting this from the total produce of the holding, it leaves 197 rupees per holding; and if we take a family to consist of four adults, including children, we get about 49 rupees per man per annum.

Kazi
Shabudin.

1871.

annum. I have assumed an average good season, and a larger holding than these holdings actually are. But, as a rule, good seasons occur once in two years, and in some parts, once in three years; and the holdings, being subdivided, are generally small.

8707. Then you do not regard the condition of the agricultural classes as being prosperous at present?—Comparatively speaking, that is, compared with what it was previous to 1840, so far as I know from official records, I think it is prosperous.

8708. But you would say that the state of the people in Guzerat is rather superior to that of the rest of the Presidency's, would you not?—Yes.

8709. Then you do not think that there is much prospect of increasing the land revenue, I presume?—At present there is no prospect, because the revenue settlements are for 30 years; but when they come to be revised, it will depend upon prices, and the policy Government may pursue; *i.e.*, whether they mean to leave any accumulation of capital in the hands of cultivators, or leave them in their present state; that is, with just enough for them to live upon. As to prices, I think that there is no prospect of any considerable rise, because all those causes which have tended to raise prices in the Bombay Presidency have nearly disappeared. First of all, there were the railways; but all our principal lines in the Presidency have been constructed. Then there was the mutiny, and then the windfall of high prices for cotton during the war in America. Those causes tended to raise prices. But I do not think that we shall have anything like the same prices hereafter, at any rate, for a long time.

8710. But do you see any means by which the produce of the country could be raised?—Yes. We might expect an increase from the land revenue if the produce could be raised; and the principal means, I think, would be irrigation. There is a great want of irrigation in the Bombay Presidency. All the irrigation that we have there is from wells. The proportion of irrigated lands to unirrigated dry crop lands is almost trifling, not even worth mentioning. Taking 1868-69, I find that the total number of acres capable of cultivation in Guzerat was 7,164,941, and of beegahs, 1,566,904. Of these only 185,820 acres, and 12,122 beegahs were irrigated, and the rest were all dry crops, depending upon rains, which are very precarious; and bad seasons are not unfrequent.

8711. You think that there might be a great increase of irrigation by means of wells?—Yes; that is the only mode at present of irrigating land there; and if the people had capital, and received encouragement, I think they would irrigate their lands by means of wells. I would also urge the necessity for systematic canal irrigation.

8712. At present there is a rate upon wells, is there not?—Yes, all wells pay a separate assessment; all irrigated lands have a water assessment charged upon them, in addition to the land assessment.

8713. What is the rate?—The rate varies according to the situation; it is about four or five rupees per acre, and in some places more.

8714. And you think it desirable that that rate should be abolished?—I think so, as the people will then see that if they dug new wells they

would not have to pay any additional assessment; at present they do not know what the Government might do if they invested what capital they have in wells, and that prevents them from digging wells.

8715. Your belief is that it operates as a great deterrent?—Yes.

8716. Then what is the state of the country as regards roads and communications?—In the Deccan there are some roads, but in Guzerat there are hardly any roads worth speaking of; all the bridges that there are, are those constructed by the railway company; there are hardly any roads or bridges constructed by the Government.

8717. Do you think that if roads were constructed it would improve the state of the country and increase the produce?—Yes, certainly.

8718. Do you think that there is a great deal of produce which cannot be sold now, which, in fact, is lost?—Yes; owing to this want of communication, and, I believe, the high rates charged by the railway company, it cannot be taken to the best markets, and the cultivators do not realise those prices which they could otherwise obtain.

8719. But would not the making of roads be very expensive, because it is a black soil, and there are no means of getting kunkur?—Yes, it would be very expensive; there is no kunkur to be had in Guzerat, in many parts of it.

8720. Have you formed any idea with respect to the redemption of the land tax?—Yes; I think that if certain classes of cultivators were allowed to redeem the land tax under certain conditions it would be a very beneficial measure, not only as a means of increasing produce, but of raising those classes in the social scale.

8721. What classes do you allude to?—I would allow those koonbees, or hereditary cultivators, so deeply attached to the soil, who might have the means of redeeming the land tax, to redeem it.

8722. Then it would appear that a great many of these cultivators have really accumulated money under this system?—There are some in Guzerat who have the means of redeeming their land tax. What accumulations they have now are either buried under ground or invested in ornaments; all this would come out, I think, and be put in circulation if they were allowed to redeem the land tax.

8723. Your opinion is that a great deal of money is now buried in the ground?—I do not think that the country is wealthy, in the sense in which we understand the term; but there are many old koonbees and patidars who have money at their disposal, more or less.

8724-5. It might be very advantageous to the ryots to redeem the land tax, but would it be equally advantageous to Government; what substitute would there be?—I do not think that you would require any substitute. In the first instance, in allowing them to redeem the land tax I would proceed gradually; I do not advocate a sweeping measure, and if Government get a good price for their land, I do not think that they require any substitute for it. They can pay off their debt gradually, and thus lessen expenditure.

8726. Do you see any means of economising outlay in the collection of the land revenue?—I think there is some room for economy in the cost of collecting the land revenue, because where the revenue survey has been introduced, the whole

*Kam
Shubudin.*
30 June
1871.

whole management of the revenue department has become so simple that we do not want the present costly machinery. The present machinery I think too costly for the work required to be done in the collection of land revenue; I think it could be done by mamlutdars, with a European officer superintending them. You do not want assistant collectors on high salaries.

8727. You would do away with European agency in collecting it?—Yes. They have now to perform two duties: one that of revenue collector, and the other that of magistrate; their principal duty now consists of magisterial work, but this work is not enough to keep them employed the whole of their time, and the revenue work is so simple that it could be safely delegated to mamlutdars, arrangements being made in connection with the judicial department for the purely judicial duties, which would not require the present number of magistrates.

8728. What is the pay of the mamlutdars?—It is 200 rupees a month for the highest grade.

8729. Then you are for separating the magisterial from the revenue functions?—Yes; and I think also that such a measure would be beneficial in other ways; it would improve the administration of criminal justice in the Mofussil. I do not think that the revenue officers (district collectors included), are proper persons to exercise magisterial functions.

8730. Why?—They, as revenue officers, have to do with a large number of people, and are frequently biassed; sometimes they are both the accusers and judges themselves.

8731. However, that cuts both ways, does it not, because they have a greater knowledge of the circumstances?—But the judicial officers in the Mofussil, I think, have as much knowledge of the people of the country as they require; and if these two departments were separated I would have all young judicial officers undergo a period of probation in the Revenue Department for two or three years before they were appointed to judicial situations.

8732. Have you heard complaints of judicial proceedings and administration?—Yes, there are complaints; and I have seen cases of that sort myself.

8733. Do you think that it would be a good plan that every European officer should elect either for the judicial or for the Revenue Department?—Yes; it would be, I think, a better plan to require all candidates admitted to the Civil Service of India to elect either for the Judicial or for the Revenue Department, and their subsequent training should be directed especially to law or agriculture, as the case may be. At present our revenue officers know little or nothing of agriculture.

8734. The duties were separated before once, were they not, in the Bombay Presidency?—I was not in the department then.

8735. Have you had anything to do with the collection of the income tax?—Yes, as Teshildar, I was collector of the income tax in my talooka.

8736. Had you much difficulty in assessing it?—No, I had not much difficulty in assessing it; the process was simple enough; I hardly knew anybody in the Pergunnah, so that all I did was to send for the village accountants and patels, and give them the schedules, which they filled in and brought to me; I could not scrutinize them; the patels and the village accountants, no doubt, took advantage of this to favour their

friends and harass others; I was obliged just to send on these schedules to the collector.

8737. You had no means whatever of testing the accuracy of these schedules?—None.

8738. And no attempt was made to test their accuracy?—No, no attempt was made; in fact, the Mamlutdar had so much to do that even if he attempted it he could not make the inquiries.

8739. Did you hear many complaints about the income tax in the Mofussil?—Yes.

8740. Do you think it presses heavily upon the people there?—It was very unequal in its operation; those who could evade it did so; others, who had no friends, or who were not on good terms with those who were in power, had to pay an almost ruinous tax.

8741. Do you think that some other tax might be substituted for it; a house tax, or a horse tax, for instance?—I do not know whether any tax could be substituted under the present circumstances. In the Bombay Presidency, I think, about 80 per cent., if not more, of the population are cultivators, and people who live on land (that is a very safe estimate, I think); they pay, generally speaking, as much as the land can bear under the present circumstances, and I do not think they can bear any additional taxation. The rest of the population are generally traders; but all taxes on trade are paid by consumers.

8742. Did you see anything of the working of the salt tax?—I have not paid much attention to the salt tax, but, I think, in certain parts of the country, it is heavy, particularly on the lower classes. In the Concan, for instance, where I was born, I saw people go to the seashore and scrape together the sands with encrusted salt after the ebb-tide, and after washing and straining them, use the salt which they so obtained. These were, of course, the poorer classes, and, I think, the tax operates heavily on those people.

8743. There have been statements made that the salt tax might be increased in the Bombay Presidency; is that your opinion?—If you could put it on classes, the richer classes might bear an increase, but the masses who live from hand to mouth I do not think could bear any additional tax of that kind; it is not that the tax itself is heavy but that their income is small.

8744. On the whole, your opinion is that the people cannot bear much additional taxation?—Not much. As to the salt tax I have stated that it would be extremely undesirable to increase it, particularly on the poorer classes, who constitute the masses. There are, of course, rich people who could afford to pay an additional tax.

8745. Then what is your idea as to the way of providing the revenue of the country; do you think that we could economise?—I think that there is great room for economy; I am speaking merely from my own impressions derived from what I saw during my residence in different parts of the country. There is great room for economy in the Public Works Department, in the Commissariat Department, and in the construction and management of railways.

8746. Do you think that this new measure of the decentralisation of finance is likely to be beneficial to the country?—I have read the Governor General's Despatch on the subject, and so far as it goes, I do not think that it is a good measure in any way.

8747. What are your objections to it?—It merely compels the local Governments to put additional taxation on their respective provinces,

and

Kazi
Shabudin.

30 June
1871.

and affords no relief, practically speaking. Moreover, hitherto, when any additional taxation was imposed by the Governor General of India, there was a strong public opinion one way or the other; but now when the local Governments imposed taxation, public opinion would dwindle into nothing almost, and would not be heard. For instance, if the Government of Bombay imposed any such tax as the late income tax, you would hardly hear any complaints in this country; but if the Governor General did so, there would be complaints from Madras, Bombay, the North-West Provinces, and Calcutta, all of which would come swelling to this country, and some attention would be paid to them. That is one decided disadvantage of decentralisation, as matters are at present.

8748. You think there might be oppressive taxation without its becoming known?—Yes, unless the natives are more consulted than they have hitherto been.

8749. Is there much discontent about the education cess?—In the Bombay Presidency I do not think there is any discontent on that subject, but I think that the people consider the imposition of the cess is a breach of faith; I mean in those provinces where the revenue settlement has been introduced for 30 years. The cultivators clearly understood the assessment then fixed to be the maximum demand to be made by Government without any addition being made to it on any account whatever, and this one-anna cess is an addition not in accordance with their understanding of the revenue settlement.

8750. You think that the chief dissatisfaction in regard to that is on account of its being a breach of faith?—Yes; its having been imposed after the 30 years' settlement.

8751. You have had good opportunities of seeing the working of the Native Governments; have you not?—Yes, I have; I am at present in the service of a native prince, his Highness the Rao of Kutch.

8752. How came you to be transferred to that service?—My services were lent by the Government of Bombay to his Highness, and I afterwards resigned the Government service, and entered the prince's service.

8753. Are there any advantages in the revenue system of the Native States that you can point out as contrasted with ours, or any changes that you could recommend?—I do not think that there are any advantages in the revenue administration of the Native States. The only advantage that the subjects of a Native State enjoy is, that they are so seldom interfered with, whereas in the British districts there are such frequent changes, and so much legislation.

8754. Do you think that they are more lightly assessed in the Native States?—I do not think that they are more lightly assessed than our cultivators.

8755. Mr. B. Denison.] You said something about the absorption of precious metals, and the burying of them; have you any general idea as to what becomes of the enormous amount of silver and precious metals that is imported into India?—It is mostly put in circulation. All our revenue systems at present demand a greater circulation of coin than in former times; our revenue is paid in coin now. Then there are greater means of communication, and payments for railways, and for troops, all require a greater circulation of coin than formerly. Formerly the

people used to barter. Within my recollection, in the Southern Maratha country, they used to do so; now they pay money; and, considering the vast requirements of the whole of India, the Native States included, I think that what is held back forms a very little portion of the bullion imported.

8756. Your opinion is, that although there are a great number of rich people in India, the population is so large that the wealth is infinitely distributed, and it is wrong to say that India is a wealthy country?—I think so. There is a great portion of this bullion which is imported that is debt; and debt means so much additional taxation to pay interest upon it.

8757. But because it is a debt, it does not take the coin itself out of circulation?—No; it does not.

8758. You said just now, did you not, that 80 per cent. of the population of the Bombay Presidency was agricultural?—Yes.

8759. And the general tenor of your evidence is unfavourable to the imposition of any tax whatsoever, over and above the land tax upon the agricultural community?—Yes; but besides the land tax, you have other taxes in Bombay. For instance, customs duties; the salt tax; the municipal taxes, in many towns; and the local fund tax.

8760. The local fund is separate; but with regard to direct taxation, you are decidedly opposed in principle, and as a matter of faith, to the imposition of any new direct taxation on the agricultural population over and above the land tax?—I do not think that Government are precluded from imposing any new Imperial taxes of a general character on the agricultural community, but they are precluded from taxing the settled land itself for any purpose whatever.

8761. Then I think you are very strongly opposed in principle to the income tax; you are opposed to it as a tax, and also having regard to the manner in which it is assessed and levied?—I am opposed to the income tax in the Mofussil, because it is an additional burden which the people are not well able to bear, and, of course, its working is very unequal.

8762. Then, on the other hand, you are in favour of the gradual redemption of the land tax by the hereditary possessor of the soil?—Yes.

8763. And at the same time you say, that even if the land tax were redeemed, no substituted tax would be requisite, because the debt might thereby be reduced?—Yes.

8764. But do not you think that every Government of the day, whatever it might be, would form its own estimate of its own necessities, and that it would impose taxation without reference to what had gone before in the way of redemption of the land tax?—Yes; but this redemption of the land tax will lessen your expenditure; there will be a corresponding decrease in the expenditure in the shape of interest. But suppose you do not allow the people to redeem the land tax, and keep your expenses as they are at present, if we require fresh taxation you must impose it in some way or other, that does not affect the question of redeeming or not redeeming the land tax.

8765. You are evidently under the impression that the expenses of Government ought to be fixed and stereotyped, although the population is going on increasing, and the wants of an improved civilisation are increasing annually?—

No,

No, I do not see that; you merely decrease the debt so much by paying the price which you receive from the cultivators for their land. I would watch this measure of allowing the cultivator to redeem the land tax with great caution, and do it very gradually, I should say, almost as an experimental measure.

8766. But then the fear is, you see, that if this redemption of the land tax were to take place, it would lead to an impression, on the part of the people, that they were for ever free from all other taxation?—Care should be taken when this measure is introduced to remove any such impression; and then, too, the education which you are giving the natives must have some effect in making them understand things better.

8767. You were strongly recommending the separation of the revenue and judicial functions?—Yes.

8768. Does that apply to the whole of the Bombay Presidency or to the more civilised parts of it?—To the whole of the Bombay Presidency.

8769. You are aware, are you not, that the separation was tried for many years in the Presidency of Bengal?—No, I am not aware of that.

8770. But do not you think that in the wild parts of India, the less civilised parts, there is an advantage in the people of the country having only one officer to apply to, one person in whom authority is centralised, and whom they can understand rather than they should be harassed about from one set of authorities to another?—I do not know why for purely judicial business they should go to the revenue officer at all: but such wild parts as you speak of hardly exist in the Bombay Presidency; I do not think that the various parts of the Presidency differ from each other materially.

8771. A system which might be adapted for some particular parts of the Bombay Presidency might be very unsuited to India generally, might it not?—I am speaking of the Bombay Presidency, and I do not think that there are such wild parts in the Bombay Presidency, with the exception, perhaps, of Panch Mehals in Guzerat.

8772. You have, I think, expressed an opinion adverse to the decentralisation of finance, on the ground that whilst the decentralisation might suit the purpose of the Imperial Government, it would not be for the good of the people?—So far as it goes at present (it might be developed into a better system hereafter) I think it is not a good measure.

8773. Is the opinion which you have given, that on questions of local taxation there are no means of getting at local opinion borne out by the fact in Bombay?—Yes.

8774. Whether for municipal or for any other purposes?—The municipalities in the Bombay Presidency are managed differently from the Revenue Department. In the Revenue Department the English officers have so much to do; and they are so isolated from the general population that they can hardly get at the feelings and opinions of the people generally. The native officials under them would, as a rule, chime in with their superiors' views, rather than offend them.

8775. What, in your opinion, would be the best means of getting at that local opinion, as regards local taxation; have you formed any opinion on the subject?—It is a subject on which I should not like to hazard an opinion now.

0.59.

8776. You are deliberately of opinion that taxation for education is not justified, in the opinion of the people, as a tax upon the agricultural community?—No; it is not justified; they do not make any difference between local taxation and Imperial taxation; whatever is demanded by Government is to them Imperial.

8777. How, in your opinion, are improvements in civil government to be introduced to keep pace with the probable civilisation of the people; you would put a limit to taxation, and at the same time you would call for improvements in all branches of civil government, I suppose?—I think I have said that there is great room for economy in the first instance; and in the second instance, I would have no improvement in the administration if that improvement was to be purchased at the sacrifice of the comfort of the people, and at the price of their contentment. I think our present judicial administration, in some parts of the country, is too highly improved for the people. For instance, our Criminal Codes and our Stamp Duties Act, which, moreover, are so frequently changed that the people hardly get accustomed to one thing before it is changed for another.

8778. Can you give to the Committee any opinion on the Stamp Act?—No, I have not studied it; I am speaking of the Act itself, I have read it some ten times, and I should hardly be able to say with certainty under what clauses certain documents would come.

8779. In your opinion, has the administration of the Government of the country been stationary, or has it improved, or has it receded, since you have been familiar with the details of the administration?—On the whole, it has improved.

8780. Is more attention given to the wants and wishes of the people, or in what way has the improvement taken place?—I think that more attention is given to the wants and wishes of the people, or rather to what the rulers fancy to be the wants and wishes of the people.

8781. But do not you think that there is a more earnest desire each year *bonâ fide* to ascertain what the opinion of the people is on measures of Government?—So far as I know the desire of officials and those who are interested in the administration, they do wish to consult, as far as possible, the wishes and opinions of the people; but whether practically they actually do it or not is a question.

8782. [Chairman.] Do you mean by your remark just now, that in so far as the Government is able to ascertain the wants and wishes of the people, they pay attention to them; or do you mean that the Government fancy things to be the wants and wishes of the people which are not so?—Most of the new measures originate with Mofussil authorities; very few originate in the council with the Government themselves; these authorities think that this is required by the people and that that is not required, and accordingly submit their recommendations; that is what I mean.

8783. Do you mean to imply that in your view these recommendations are often inconsistent with the real wishes and wants of the people?—They are not always in accordance with the wishes and wants of the people.

8784. Mr. B. Denison.] When a new Act is proposed in the Legislative Council, either Imperial or local, it has long been the practice, has

Kazi
Shabudin.

30 June
1871.

Kazi
Shabudin.
30 June
1871.

has it not, to ask the opinions of the local district officers, and the local district officers would again ask the opinion of selected gentlemen like yourself, who have intimate knowledge of the people?—That may be the case now, but when I was in the department I do not think the natives were so systematically consulted.

8785. Have you any acquaintance with the native press in the Bombay Presidency?—Yes.

8786. Is the tone of the native press on the whole favourable or hostile to the Government?—It may appear hostile when it criticises the acts of Government; if you call that hostility, of course there is hostility; but I think that the best friends of Government must criticise their acts, and the native press does it with the best possible intentions. I know several writers in the native press, and you cannot have more loyal subjects than they are.

8787. Although the criticism is pretty sharp, and very often unfavourable, still it is not disloyal criticism?—Not in the least.

8788. Would you say that both of the Hindoo and of the Mahometan press?—We have hardly any Mahometan newspapers worth speaking of on the Bombay side. We have two or three Mahometan papers, but they are all insignificant, and generally do not write about Government.

8789. These native papers do criticise, pretty sharply, proposed legislation?—Yes.

8790. Do not you think that from those native papers the Government, if so minded, may get a very tolerable idea of what is the current opinion?—Yes; but the writers of these native papers are for the most part young men educated in our Presidency colleges, who have lived, generally speaking, in the Presidency town itself; there are very few who are well acquainted with the Mofussil and its administration.

8791. Is there any supervision of the native press in the Bombay Presidency?—So far as I knew the Government keep themselves acquainted with what is written in the vernacular papers.

8792. Is there any particular officer whose business it is to keep the Government informed of what is being written in the native press?—I believe there is an officer whose business it is to report to Government on the native press; that is to say, he places before Government English translations of vernacular articles of importance.

8793. Then is it your opinion that the managers or the writers of the native press are young men of inexperience, who have not the best means of forming mature opinions?—It is difficult to give a general answer to the question. I know two or three who are well acquainted with the Mofussil, who have lands in the Mofussil, and are familiar with Mofussil administration; but there are others not so qualified.

8794. Are there not some papers in the Bombay Presidency under the guidance of the English or American Missionaries?—Yes, one or two.

8795. And do not those papers pretty faithfully reflect what is passing in the native mind on subjects of administration, quite apart from religious subjects I mean? I have not been reading those papers lately, and I cannot say.

8796. Sir C. Wingfield.] You were asked some questions just now on the comparative advantages of the British and the native land revenue system. You said, I understand that they are not more lightly assessed in the native States, but that the people are less interfered with?—That is so.

8797. I imagine you mean that the management of their village affairs is left more with them?—Yes.

8798. The village servants are not so much under the orders of the Government as they are in the British territories?—They are not.

8799. They are more essentially village servants?—Yes, they are responsible to the village communities.

8800. And they are not bothered with particular forms and particular modes of keeping their accounts, and fines, for neglect of those forms?—No.

8801. You think that all that interference which exists in our territories is distasteful to the people?—Yes, it unsettles their minds; they do not know what may come next, or how often things may be changed.

8802. And has not this been said in favour of the native system of land revenue, that it is more elastic than the British system; that an allowance is made in unfavourable seasons, and that the deficiency is made up in good seasons?—In most of the native states the revenue is collected in kind, and a certain portion, which is called the king's share, is taken from the produce. Under this system, when a field produces nothing, of course nothing is taken.

8803. But the prevalence of payment in kind shows an inferior kind of agriculture and cultivation in the district, does it not?—Not necessarily.

8804. It has been found to be so in India by observation, has it not?—I do not think that that system of collecting revenue interferes with the mode of agriculture so much as with the due realization of the revenue itself. It is very difficult to work it, but I do not think it affects the mode of agriculture.

8805. But in Upper India is it not found to be so; a man has little inducement to grow a valuable crop if he must give up a large portion of that crop; whereas, if he pays a fixed money rent, the more valuable the crop he can raise on it the more money he will make himself?—I think that a fixed money rent is far better than collecting the revenue in kind.

8806. I think what you meant to say just now about the district officers or the British authorities not always recommending those things, that what the people would most wish for was this, that the British authorities take great pains to think for the people, but they are apt to forget to find out what the people think for themselves?—Yes; I believe that they conscientiously strive to do good, but the difficulty is to ascertain exactly what is to be done.

8807. You said that any increased production or increased revenue must come from extended irrigation?—Yes.

8808. And I think you said that irrigation must come from wells; but are not canals practicable in great parts of the Bombay Presidency?—I believe I did not state that it must come from wells alone, but that is the only present mode of irrigating land in the Bombay Presidency.

8809. But canals are practicable, are they not?—I can hardly give an opinion on such a subject, but there are magnificent rivers flowing through Guzerat which are not utilised for irrigation.

8810. What district or province were you referring to when you made that remark, or does it apply generally throughout the Bombay Presidency?—Generally to the whole Presidency, and especially to Guzerat.

8811. Does

Kazi
Shabudin.

30 June
1871.

8811. Does the water lie deep generally throughout that Presidency?—The depth differs in different Provinces; it is generally pretty deep; excepting near the coast, it is hardly above 35 feet anywhere.

8812. With regard to the redemption of the land revenue, you are probably aware that it was decreed by Lord Canning, but disallowed by Sir Charles Wood?—Yes, I have read the correspondence.

8813. Has not the administration of criminal justice been improved since the introduction of the codes of criminal procedure and the penal code?—Yes, I think so.

8814. That is to say it is more formal, more regular, and more precise?—Yes.

8815. Individual officers cannot now conduct judicial or criminal proceedings in the slovenly lax manner that was not uncommon before?—Yes; in fact it is too formal and too precise for some classes of the people.

8816. But it gives an increased security for careful hearing and inquiry?—Yes; on the whole I think it is a great improvement on the old lax system.

8817. With regard to the income tax, on which you were asked some questions, have you any idea what proportion of the population in your district were assessed for the income tax?—No.

8818. Very small, I suppose?—Very small.

8819. Probably not 5 per cent.?—I can hardly say.

8820. And did you surcharge a large portion of the returns; that is to say, did you charge them above their returns, on higher returns of income than they sent in?—Yes.

8821. So that the practice was general to understate the income?—Well, we took it to be so when we received the returns.

8822. That is to say, you assume, as a matter of course, that nobody would give a true return?—Then there was another reason for our taking it to be understated. Revenue officers were under the impression, to some extent a mistaken one, that the more they collected the smarter they would appear to be in the eyes of their superiors.

8823. You said, I think, that this new scheme of what is called decentralization of finance would have the effect of forcing the local Governments to impose additional taxation?—It has already had that effect.

8824. And, in fact, Sir Seymour Fitzgerald has distinctly stated that it has compelled him to impose novel taxation on the Bombay Presidency?—Yes; and, from his speech, I conclude that he resorted to that measure of additional taxation with great reluctance.

8825. He said, "I must either starve the public services or raise additional money"?—Just so.

8826. And that measure gives no control whatever to the different Governments over their receipts; it merely gives them additional control over a certain allotted portion of the expenditure?—Yes.

8827. You have heard, I suppose, the proposal that has often been made, that the Imperial Government should draw on the local Governments rateably for general charges, such as the army, debt, diplomacy, and home charges, and leave them to spend the rest of the revenue?—Yes; and in my opinion that would be a proper measure.

8828. And it would give the local Governments
0.59.

an inducement to economy?—Yes, it would make them more economical.

8829. It would prevent the revenues of one province being spent on another province?—Yes; but there are some provinces which do not pay their own expenses. In all such cases the other-provinces must help them.

8830. The wants of the backward provinces must be an item of Imperial charge?—Yes.

8831. About that education cess, I think you draw a distinction, do you not, between the education cess which was imposed at the time the settlement is being made, that is to say, at the time engagements are being taken by landholders for their land revenue, when they are asked to engage for an education cess in conjunction with the land cess, and imposing a cess after the settlement has been concluded; in fact, during the currency of the settlement; that is a very material distinction, is it not?—Undoubtedly.

8832. In Bombay, after the settlement had been concluded, they have imposed an additional cess, have they not?—Yes.

8833. And I think that Lord Lawrence and Sir Charles Wood both said with reference to the project, that to put on a cess for education after the settlement had been concluded and engagements taken to pay a certain sum for a certain term of years, would be regarded by the people as a breach of faith?—I am not aware of that opinion; but the ryots do regard it as a breach of faith, certainly.

8834. When the education cess is proposed before the engagements for a term of years is taken, the people generally have not been found to object to it, have they?—No.

8835. Practically, do you think that it is an absolute addition to the assessment, or that it is partially taken out of the assessment?—It is an addition to the assessment.

8836. Do you think that in the way in which it is imposed it is an absolute addition?—Yes, it is taken from the ryots; under the ryotwari system the cultivator pays so much more to Government.

8837. Do you know that in Upper India that is not quite the case; the assessments and cesses are taken in a lump sum, and then that lump sum is liable to be cut down afterwards if it is thought to be too large a demand; so that a sort of higgling of the market goes on as to the gross sum to be demanded, and in that way part of the cess may come upon the Government, and the people do not feel it so much?—No; but in the Bombay Presidency every cultivator pays his own local fund as regularly as his assessment.

8838. But the great objection which the people entertain is to being asked to pay additional cesses on land after engagements have been concluded with them, that for a certain term of years such a sum and no more shall be taken?—Yes; and not only do the people understand that to be the condition, but I find that Sir George Wingate himself, who principally introduced the revenue settlement into the Bombay Presidency, has stated in an official letter that nothing whatever beyond this assessment would be levied from cultivators during the 30 years. The letter is in a Parliamentary Blue Book.

8839. But you are not opposed, on principle, to an Imperial tax of a general nature that is laid on owners of land in common with all other classes

Kazi
Shahudin.

30 June
1871.

classes of the population?—Not if it is a general tax, such as the income tax.

8840. You may object to it as a bad mode of taxation, but, on principle, you do not object to it because it is levied on all classes of the population alike, and not on the land especially?—Yes, it would be objectionable if it were especially levied on the land.

8841. Mr. *Fawcett*.] I understand you to say, that you have held an official position both under the British Government in India and also in a native State?—Yes.

8842. Then you are so intimately acquainted with the revenue systems under British rule and Native rule that you can make a comparison between them?—I shall be happy to give such information as I possess.

8843. You have said, in reference to the revenue system in the native State to which you referred, that the land revenue is levied in a form well suited to the habits of the people, being levied in kind?—I do not think I stated that, but I stated a fact, namely, that the revenue in most native States is collected in kind.

8844. And do the people like this plan of levying it; is it more popular with the people than the other plan?—I think it depends upon what share is taken; it is not so much how it is taken, but what share is left to the cultivator, and what share is taken by the Government.

8845. Is the land assessment in the native States heavier on the average than it is in the British territories?—I believe generally it is.

8846. With regard to other taxes, are they as heavy in the native States?—I think they are.

8847. Is the salt tax, for instance?—I do not think there is any salt tax in any native State that I am acquainted with.

8848. Then do they use British salt, or have they salt of their own?—In some States they have salt of their own, and in some they use British salt.

8849. Considering that salt is enormously taxed in the British States, and that in many of the native States you say it is not taxed at all, what other taxes are imposed in the native States?—There are the customs' duties.

8850. Are those heavier in the native States?—I think they are heavier in the native States; and then there are shop taxes, and again transit duties; these latter are being gradually abolished now; and there are other small taxes on the land and property.

8851. So that taking the aggregate of taxation in the native States, would you say that it is higher or lower than in the British States?—I do not think that I can give any opinion on that point.

8852. *Chairman*.] You know what an octroi duty is in France; that is to say, a duty levied upon articles of consumption coming into towns?—Yes, we have that in Bombay.

8853. Do you know whether it is still the practice in the native States to levy such a duty on nearly all articles of consumption coming into towns, and especially walled towns?—It is.

8854. Mr. *Fawcett*.] Viewing the whole amount taken from the people, you would rather not give an opinion as to whether it is greater in the native States?—I would rather not; my impression is that in the native States it is heavier; but that is only an impression.

8855. I suppose you have seen the very contrary stated, and have heard it said that the tax-

ation is much higher in the British States than in the native States?—I have.

8856. But, on the whole, you are not prepared to give any very confident opinion on the point?—No; I am only acquainted with some of the native States in the Bombay Presidency, and I do not know the state of things in Rajpootana or other parts of India.

8857. You have, as I gather, heard a great deal of discontent expressed with the taxation that is imposed, and the revenue that is levied in the British states; I suppose that a great part of that discontent arises not so much from the amount of taxation as from the mode in which it is levied, and the constant changes?—I think the amount of taxation is one of the causes of discontent.

8858. And the mode in which it is levied, and the frequent changes to which you have referred, are another cause of discontent?—Yes; frequent changes always tending to increase taxation.

8859. So that the people are heavily taxed, and the taxation is imposed in a form not agreeable to them?—Yes.

8860. Are the people more consulted in the Native States as to the taxation that is imposed upon them than they are in the British States?—All Native States have almost all their officials drawn from the people; these officials are born there; live among the people, and know exactly what the people say, and what they feel, and that is the best source of information that the Durbars could have.

8861. Sir Donald McLeod, whose name is, of course, perfectly familiar to you, has expressed an opinion that there is little mutual understanding between the British Government and the natives, from the fact that they are not consulted; whereas he says in the Native States the people, to a great extent, govern themselves; in fact, that their village communities may be regarded as Republican institutions to a great extent; do you agree in that?—Yes, to a certain extent.

8862. I suppose you think that great good would result from taking the natives more into our confidence?—I think so; I do not think that there is any measure that would tend to satisfy the people, and facilitate legislation so much as consulting the people themselves on great measures.

8863. I think I understood you to say that you are not prepared with any plan for arriving at this increased consultation of the people?—I would rather not hazard any opinion on the subject at present.

8864. But you have no doubt as to its necessity and importance?—No doubt at all; on the contrary, I am perfectly convinced that a measure with that object would be the best that could be adopted.

8865. I understand from a previous witness (I do not know whether you share the same opinion) that the Legislative Council has no function with regard to the revenue?—They pass all enactments which are required by the Revenue Department for the collection of revenue, and the management of the revenue system.

8866. But we were informed by a previous witness, and I wanted you, if you could, to express an opinion on the point, and to corroborate his statement or otherwise, that, for instance, when Sir Charles Wood, in 1862, sent out an order which, under certain circumstances, would have introduced

Kaai
Shabudin.
30 June
1871.

introduced the permanent settlement, the Legislative Council in Calcutta had no power to cancel that order?—The Legislative Council certainly have no such power, so far as I know.

8867. And the only way in which there is any native representation at all is, that on the Legislative Council there may be two or three native gentlemen?—Yes, that is the only representation of the natives, and I do not think that it is at all a satisfactory representation of the people.

8868. So that any measure vitally affecting a question of revenue may be sent out from England, and even the Council on which the natives have a very inadequate representation has no power of cancelling it?—So far as I know they have no such power.

8869. You have referred to the people of India being annoyed and worried by constant changes, have you not?—These constant changes, I think do unsettle their minds and puzzle them.

8870. So that they would be better pleased, you think, even if they had not quite such perfect laws, if they were allowed to have more rest and repose?—I think so, as respects the masses.

8871. In fact, what your opinion would lead to is this, is it not, that the Government of India very often produces discontent amongst the masses, because it has so much the character of an inelastic centralisation?—I think so.

8872. You consider the mass of the people of India, as I gather from your answers, as being, when you have regard to their means, very heavily taxed?—Yes; when we consider their means, I think that they are heavily taxed.

8873. Suppose it was required, for instance, to raise 5,000,000 *l.* of additional revenue, could you suggest any means of doing that which would not produce a great deal of discontent among the people of India?—If it were absolutely necessary I would resort to indirect taxation.

8874. Then, do you think that you could raise any large sum like 5,000,000 *l.*, by any indirect taxation, without seriously impeding trade, or seriously affecting the comforts of the people?—It would have the effect, to a certain extent, of impeding trade, but that would be better than creating general discontent among the people.

8875. Are you aware that if the necessities of the Government go on increasing, or rather if their expenditure goes on increasing as it has within the last few years, in the course of a very few years, considerably more than 5,000,000 *l.* of additional revenue will be required?—All that will depend upon what policy Government pursue with regard to their finances.

8876. But if they pursue in the future the policy which they have pursued during the last 12 years, considerably more than 5,000,000 *l.* of additional revenue will be required will it not?—Yes, that is obvious.

8877. You referred to the very great discontent produced by the proposed education cess levied upon land, and you have expressed an opinion, have you not, that the people would consider it a direct breach of faith?—I do not think I said that there was any great discontent; but I certainly said that they do consider it as a breach of faith.

8878. Both in the case of the permanent settlement and in the case of the 30 years' settlement?—I am not speaking of the Bengal cess at all; I am speaking of the educational and local improvement cess which has been introduced in Bombay; and wherever this cess has been introduced after

the settlement of the land revenue for 30 years, the ryots consider it a breach of faith.

8879. But if they consider the levying of an education cess a breach of faith in the case of a settlement of 30 years, there is even greater reason why they should consider it a breach of faith if levied after a permanent settlement, is there not?—Yes, if the character of that permanent settlement admitted of any such tax being considered a breach of faith; it would depend upon the terms of the settlement.

8880. But I suppose if this education cess were levied upon lands which have been settled for 30 years, people would feel no security whatever, but that other cesses might be levied, and so, in the end, a very serious addition might be made to the land revenue which they would have to pay?—Yes, that would be the consequence.

8881. It destroys all feeling of confidence in the security of their tenure?—Yes.

8882. If the argument is put that education is essential to the people, and it is necessary to obtain money to provide for it, the tenor of your evidence would lead to this conclusion, would it not, that all the requisite money for education might be obtained by increased economy in the present expenditure?—Yes.

8883. You have expressed an opinion that it would be advisable to redeem the land tax, have you not?—Yes.

8884. You base that opinion chiefly, do you not, on the fact that the redemption of the land tax would save the annual cost of collecting it?—That is one argument in its favour (it must be understood that all my answers apply to the Bombay Presidency); but there would be other advantages, such as the obvious advantage of cultivators possessing these lands as their own, and making any improvements they like, and investing largely in the land, without apprehending that the next settlement would absorb the result of their investments; they would be more prudent, I think, more frugal, and more like thinking citizens, than tenants-at-will; I do not mean that they are at present entirely tenants-at-will, but they have no feeling of security.

8885. But redeeming the land tax is exactly the same thing, is it not, as permanently settling the land and capitalising the annual assessment?—Yes.

8886. But then, have we not seen from the past, with regard to the permanent settlement of Bengal, that the Government, by adopting a permanent settlement, sacrifices an enormous amount of revenue which might be used, if it had not been sacrificed, for the general good of the community?—But if proper precautions were taken, I do not see why they should sacrifice any probable increase from land revenue.

8887. But, for instance, with regard to the first permanent settlement, the settlement in 1793, if you had adopted a permanent settlement at all, by what possible precautions could you have secured the Government against a future loss of revenue?—Speaking of the redemption of the land tax in Bombay, I would in the first place take into consideration what possible increase could be expected at the next revision from all circumstances; I would take prices into consideration; and then I would also take into consideration the rate of interest which we are paying on our debt, what possibility there was of a reduction in that rate, and of course arrange the price of the land accordingly.

Kazi
Shabudin.

30 June
1871.

8888. But is it possible for any statesman, however prudent he may be, to foresee all the circumstances which may affect the value of land during the future?—But when there is any great good to be gained from any measure, we are only to take probabilities into consideration; we cannot foresee with certainty all contingencies.

8889. But, for instance, I have seen it stated, and I believe that it has been stated by the best authorities, that if Bengal could be at the present moment re-assessed, the Government could obtain between three and four times as much revenue as they now obtain under the permanent settlement. That being the case, do you think that it would have been possible for any statesman in 1793 to have foreseen the causes which have increased the value of the land by 300 per cent.?—I have not studied this permanent settlement question so closely as to be able to give an opinion.

8890. Mr. J. B. Smith.] You recommend the permanent settlement in Bombay, though you have not studied it, in fact?—It is not exactly the permanent settlement of Bengal that I recommend. I do not know whether these precautions which I suggest were adopted in the permanent settlement of Bengal; that is, a question which requires careful study; but what I mean is this, that if all these precautions were adopted in Bombay, I do not think any loss of revenue would result from the people being allowed to redeem the land-tax.

8891. Mr. Fawcett.] But I will put one case to you which will show that it is impossible to foresee causes affecting the value of land; you have referred to the great increase in prices which has taken place in India during the last 15 years; that increase in prices has been estimated as at least 50 per cent., has it not?—Yes.

8892. If you had a permanent settlement or redemption of the land-tax (which comes to the same thing), the amount for which it is redeemed would be reduced, in value virtually by 50 per cent., owing to this increase in prices, would it not?—Yes; but this increase was owing entirely to exceptional circumstances. The causes of the increase were not ordinary; I should only take ordinary causes of increase of prices into consideration.

8893. But when you say that it is owing to exceptional circumstances, the Government, when entering into a permanent arrangement like that, ought to consider whether these circumstances that you describe as exceptional may not possibly recur?—There may be also exceptional circumstances which may decrease prices instead of increasing them; there are probabilities on both sides.

8894. But arguing by analogy, prices have shown a constant and steady tendency to increase, have they not?—I have been looking into this question of prices. I have not the figures here, because I have not completed the reading of some of the Government selections, but I find that prices before 1820 in the Bombay Presidency were very high; but after 1820 they went down till 1838 and 1840, more than 50 per cent., in some instances 100 per cent., and they are now rising; thus, these fluctuations we cannot foresee; they may be favourable or unfavourable; we can only take ordinary probabilities into consideration, and not exceptional causes.

8895. But still during the last few years all

the circumstances have shown that prices are likely to increase, and have increased, have they not?—Yes.

8896. And if prices do increase, the permanent settlement or redemption of the land-tax must be exceedingly undesirable?—Yes; but there must be a limit to the increase.

8897. No; because, supposing you take silver as the standard of value in India, there is no physical reason, is there, why silver, supposing very rich mines were discovered, might not become as cheap as copper?—No.

8898. At any rate, any day, owing to the discovery of very rich deposits of silver, or owing to improvements in the mode of working silver mines, or the mode of extracting it from the ore, you might find the value of silver, suddenly almost, greatly reduced?—Yes; but taking all those circumstances into consideration, I do not think that Government would be precluded from imposing any general Imperial taxation on those who might have redeemed their land-tax; their wealth or accumulation could be reached in that way, whenever there was a necessity for additional taxation.

8899. But what your opinion rather seems to lead to is this: that if the people who have redeemed the land-tax made an extremely good bargain by its redemption, then the Government would have a moral claim to impose additional taxation upon these particular people who benefit by it?—As to good bargains, I think it is the Government who ought to make good bargains, and not the people. If they got 30 or 35 years' purchase for their land, I think that would be a very good bargain.

8900. But when you find the Government agreeing to accept for ever a certain annual charge for the land of Bengal, and when you find that if they had not entered into that permanent arrangement they would be able now to obtain three or four times as much, you cannot say that the Government has made a good bargain?—No, not in those circumstances; in fact, as to the permanent settlement in Bengal, I can hardly say anything.

8901. I will put another point: the only justification for our rule in India is, that we should do something for the progress of that country, is it not?—Yes.

8902. If we continue in India, we must feel some confidence that during the next years there will be general progress in the material condition of the country?—Yes.

8903. If there is general progress in the material condition of the country, does it not inevitably follow, almost as a law of nature, that the value of the land must increase?—Yes; but Government must take that into consideration before it parts with the land.

8904. But have you got any scheme by which you think it would be possible to take all those considerations into account?—I can generally say that those cultivators (I mean not merchants or speculators, but peasants who actually cultivate their lands) who are in good circumstances, and who, without borrowing, can afford to redeem their land-tax, ought to be allowed to redeem it for such a number of years' purchase as would cover all these possible increases, or a probable decrease in the rate of interest that we are paying now.

8905. But I understand that through the greater part of the Bombay Presidency the persons

sons who pay the land revenue are not the actual cultivators and labourers, are they?—Most of them are.

8906. Do they not very often rent under other people?—Very few, comparatively.

8907. There are not many agricultural labourers, then?—I mean all those who hold lands from Government do actually cultivate them.

8908. But then they employ labourers under them, do they not?—Yes.

8909. You say that 80 per cent. of the whole population of Bombay are engaged in the cultivation of land; out of that 80 per cent., how many are direct payers of land revenue to the Government?—I can hardly give you an estimate, but the great majority are.

8910. *Mr. Beach.* I understand that you think that the improvements in India have been conducted on rather too extensive a scale, because sometime ago you stated that you objected to improvements purchased at the expense of the comfort of the people, and you alluded to the general works in India?—I think the question was whether, if improvement in the civil government were required, I would not advocate additional taxation; and I think I said that if the people were not able to bear additional taxation, I would rather dispense with these improvements than impose additional taxation which would interfere with the comfort of the people, and cause general discontent.

8911. Some of these improvements have been actually necessary, have they not?—Yes.

8912. For instance, works of irrigation have been of the greatest public benefit, have they not?—Yes, in the few localities where they have been carried out.

8913. And railways, I suppose, contribute very much to the comfort of the people?—Yes; they are very costly according to my opinion.

8914. But still you would say that of the present day they are absolutely necessary; would you not?—Yes.

8915. Still you think that we have conducted these improvements in rather too expensive a manner?—That is my impression.

8915*. That we ought only to effect these improvements when we can afford them?—There are some improvements, such as irrigation, which the current revenue may not be able to afford, but which are necessary, and must be introduced with borrowed money that could be eventually paid off.

8916. There is always a tendency to incur a debt in a country, and it is very seldom that it is ever paid off, is it not?—Yes; but then you will be able to save interest from the additional revenue which you will derive from these improvements; and in addition to that you will be able to save many lives which are now lost from famines.

8917. But still these improvements do not more than pay their own expenses in their conduct, do they?—I can hardly enter into details, because I am not acquainted with the departmental working of those works.

8918. But admitting that these improvements confer a great public benefit on the country, from what source would the Government reap the benefit of the increased comfort and prosperity of the people?—Irrigation, if successful, will yield an increased land revenue; if Government provides water it can fairly charge for that water.

8919. The land revenue is nearly the only

source which would provide to the Government a source of increased revenue?—In the case of irrigation it is no more than what you pay here for water; you may call it land revenue because it is exclusively applied to the cultivation of land, but it is just similar to what you pay for anything else.

8920. Still the land revenue is the chief source to which the Government may look for increased revenue; it is the chief test of the improvement of the country, is it not?—Yes; this increase must be looked for simultaneously with the increase of produce per acre from the land.

8921. Of course if the redemption of the land tax were to take place there could be no increase from that source?—But this redemption would not be at the present rate of taxation on the land. In allowing the people to redeem the land tax we must cover all probable increase, not only from increase in prices, but also from other circumstances; perhaps we shall have to pay a lower rate of interest hereafter than we do now, and that ought to be taken into consideration too. I am speaking of the redemption of the land tax as almost an experimental measure to be introduced most cautiously and carefully, not as a general sweeping measure.

8922. Supposing that the project for the total redemption of the land tax were not entertained, would the next best project, in your opinion, be a 30 years' lease?—I think so.

8923. With regard to the income tax, does that generally fall on a section of the people who would not otherwise contribute largely to the revenue in the way of land tax, say?—It does not fall on the masses, the general cultivators, but falls on those who derive a profit from other sources than land. In the Bombay Presidency it was put even on the land produce when it was manufactured into something else: for instance, sugar-cane, so long as it remained sugar-cane, paid no additional tax; but the moment that it was converted into molasses it paid the income tax; and in this manner cultivators of sugar-cane and, I think, also of tobacco, were brought under that tax.

8924. I suppose it falls a great deal upon the inhabitants of towns?—Yes.

8925. *Sir S. Northcote.* You spoke rather strongly just now upon the costliness of the railways; did you mean to imply that the railways were unnecessarily costly; that more had been spent upon them than should have been spent?—Yes. I have travelled on these railways, and lived in their neighbourhood, and gathered my information from those actually engaged on the works; and I think that their construction has been more costly than it ought to have been, and that their management also is costly.

8926. With regard to their construction, do you mean that more has been spent in works than is necessary in general, or that the works have been badly done, and have had to be done again?—I meant that the works were badly done, and had to be done again.

8927. To what do you attribute that?—I cannot attribute it to any other cause than that which I have mentioned, laxity of management.

8928. Do you think that it is a good system that the Government should guarantee these railways, and that their construction should be left to private companies?—If private companies would

Kazi
Shabudin.

30 June
1871.

Kazi
Shabudin.
—
30 June
1871.

would not construct these railways without the guarantee, the Government have no other alternative but to guarantee them; but the effect of this guarantee is that nobody pays that degree of attention to the construction of railways, which otherwise the shareholders and the directors would pay.

8929. You say that the Government have no other alternative; of course there is another alternative, namely, that Government might construct them themselves?—Yes, that is what they are doing now.

8930. I wanted to get your opinion as to which is the better system?—I can hardly give an opinion on that point.

8931. I think I understand that you advocate the principle of a permanent settlement of the land revenue?—The phrase "permanent settlement," as I understand from what has taken place in Bengal, hardly describes what I mean. I advocate allowing those ryots or peasants who cultivate their own land, under certain conditions and with proper precautions, to redeem their land tax on terms favourable to Government, such as will cover any probable increase resulting from prices and other causes.

8932. You would confine that privilege to the ryots?—Exclusively to the ryots.

8933. Then for the purpose of a redemption of the land tax you must of course make the rate of the land tax constant and fixed?—It becomes fixed.

8934. That having once been done, I want to know from what other sources you think that money should be derived for the purpose of works and improvements that are necessary?—The money which would be obtained by the redemption of the land tax would be capitalised, and it would lessen the expenditure by the debt being paid off.

8935. No doubt it would lessen the expenditure, but at the same time a source of revenue would be cut off, and I presume that the interest of the money so obtained would go either to the extinction of the charge of debt or to the maintenance of the common service of the State?—But I think that the extinction of the debt ought to be kept in view; the effect will be that you will extinguish a source of income and a corresponding source of expenditure. If any additional taxation be now required, you will have to provide for it somehow; in the same way, after the extinction of this source of income you would have to adopt the same measure to do what might be advisable under the circumstances.

8936. But what I mean to put is this: supposing that the land tax has been redeemed, and supposing that an equilibrium has been established between revenue and expenditure, and supposing that further works of improvement are desired, I want to know in what way those works of improvement are to be paid for. You suggested just now the possibility of paying for them by borrowed money; I want to know how the interest on that borrowed money is to be raised?—I do not see any difference between what should be done now when there is no redemption of land tax allowed, and what might be done hereafter if a redemption of land tax was allowed; if you require any additional money now you resort to some measure or other in addition to the land tax which you have.

8937. But what I understood you to say just now in answer to a question put to you was, that

the improvement of land by irrigation, for instance, would produce an improvement in the land revenue, and that that would repay the expenditure; but if the land revenue has been redeemed, there would be then no improvement in the revenue from the irrigation?—I do not see why a water rate should not be charged by Government if water is provided by Government.

8938. You would have a water cess then?—Yes.

8939. Would you have in the case of other improvements the same principle applied, and have special cesses levied in order to meet the charge of those improvements?—That is too general a question for me to answer.

8940. Take the case of making roads, would you have a road cess to pay for the expense of making roads; I understand that if the land revenue system is continued, the making of the roads through any district might improve that district, and so improve the land revenue; but if the land revenue has been redeemed, that would not take place?—The redemption of the land tax would not preclude Government from imposing general taxation of an imperial nature; upon the land specially it would, but not from levying any general taxes, income tax, or customs duties, or any such taxation.

8941. Do you think that it would be desirable that such works of improvement as irrigation, or the making of roads, should be paid for by customs' duties?—I am mentioning the nature of the Imperial taxes that occurred to me; but I do not think that such improvements are a proper charge on customs' duties.

8942. An income tax might be levied, you think?—Yes.

8943. Are you an advocate for the income-tax?—I think it is a very equitable tax, but in India I think it operates very unequally.

8944. I mean, do you think that it is a tax to which we should look as the one which is to make up for the loss which we should sustain in land revenue by the redemption of the land revenue?—You are speaking of "loss," which I do not see; we do not sustain any loss by the redemption of land revenue.

8945. Suppose at the present time that a particular district is producing land revenue to the amount of 10,000 rupees a year, what is your idea as to the redemption of that land tax?—I would allow such of the cultivators as were able to redeem their land revenue to redeem it at 35 years, and by that means you will be able to pay off a portion of your debt, which now averages, I think, 20 years' purchase, and you will have 15 years' purchase money as the result of a good bargain.

8946. Then you have got a certain sum of money, and have given up a revenue of 10,000 rupees a year?—Yes.

8947. Now, then, suppose that works are undertaken in this district which improve the value of the land to, we will say, double that amount, works of irrigation, roads and so on, so that if the redemption had not taken place, you would, at the next revision of the settlement, have raised the revenue to 20,000 rupees, you have not the means of doing that?—Not after redemption, of course.

8948. These works have been executed at a certain expense; how is that expense to be met?—With regard to irrigation, I think that those who

who derive benefit from those irrigation works ought to pay for it.

8949. By a cess?—Yes.

8950. With regard to roads, how would they be paid for?—There may be local taxation.

8951. You would have a local cess for the purpose?—Yes.

8952. And you think that that would not be complained of?—If that were the understanding with those who might redeem their land tax, it need not be complained of.

8953. Then they would be subject to any local cess that might be thought proper by the Government?—Yes.

8954. Would you apply that to the case of education; supposing it were desirable to build schools in this district, would you think it equitable, after the redemption of the land tax, to levy an education cess?—Yes.

8955. And for an increase of the police?—Yes.

8956. Therefore the land would be subject to such taxes for such purposes as appear to be of a local character as the Government might think fit?—Yes; but all those who do not hold land would also come under those taxes.

8957. Would you prefer to leave these questions to the Presidency Government, or in the hands of the Government of India?—I would certainly leave them to the Presidency Government, with the consent of the people, as far as practicable.

8958. You would have some representation?—Some means of knowing the wishes of the people.

8959. The people of the Presidency generally, or of the districts assessed?—The people in the different provinces; I would consult the Guzerat people for Guzerat, and the Deccan people for the Deccan.

8960. Mr. J. B. Smith.] You have expressed very strong opinions in favour of redeeming the land-tax, giving the owners of land the opportunity, if they think proper, of redeeming it?—Yes.

8961. Have you any specific plan for carrying that scheme into effect?—I may state, generally, that in those districts which have been lately settled, and under the most favourable circumstances, so far as prices are concerned, and which have established means of communication with the best markets in the Presidency, such people as are in good circumstances, who cultivate their own lands, and who are by birth cultivators, ought to be allowed to redeem their land-tax.

8962. And what is the specific plan that you have for carrying that into effect; on what principle is it to be done, according to your notions?—It will depend on the locality; you would give them the option of redeeming the land-tax in some districts at 25 years' purchase, and in some at 30 or 35, even.

8963. We will suppose that the people in the whole Presidency of Bombay avail themselves of the power of redeeming their land-tax; what would you do with the money?—I would not give that power to the whole agricultural population. In the first place, they have not their own capital to redeem their land-tax with; and if that general permission were given, they would take to borrowing, which would be injurious. I would only allow a few at a time, under certain circumstances, to redeem their land-tax.

8964. What portion of the people would you

allow to redeem their land-tax?—I can hardly say.

8965. Is there any particular class that you would allow to do it?—Yes; the actual cultivators, called Koonbees, who are the hereditary cultivators, and are much attached to the soil.

8966. You would allow them to redeem their land-tax, but not other persons?—There are not many owners of land in Bombay. The Inamdars do not pay any land revenue to Government; they pay an Inam quit rent, but they hold their land on fee simple.

8967. There would be a large sum of money raised by the redemption of this tax; what would you do with the money?—I do not think that any very considerable sum would be raised; but such as might be raised I would apply to paying off the debt.

8968. It would all be raised ultimately?—Very gradually; Government could stop it at any time.

8969. And you would pay off the debt with it?—Yes.

8970. Then you have been asked some questions as to what you would do, supposing it was necessary to impose taxes for education or for making roads, or for the increased expenses of the Government; you are aware that, as civilisation advances, Government becomes more expensive everywhere?—Yes.

8971. How would you meet those expenses?—I advocate this redemption of the land-tax as a means of increasing the production of the land. Increasing the production of the land means the ability of the people to pay more taxes; I do not advocate it on any other principle.

8972. But in what way are they to raise the revenue for these purposes; the Government having parted with the land, derive after that only a fixed benefit from it; they will derive no benefit from any improvement in the value of the land; how are they to meet the necessary expenses?—But the expenses will not remain so high as at present; they will decrease in proportion to the diminution of the land-tax; and in allowing the cultivators to redeem their land-tax you will take all these possible causes of increase in the land revenue into consideration.

8973. In what way will the expenses be diminished?—You will not have to pay so much interest on the debt.

8974. Then the Government would be in this position, that instead of receiving rent from the land they would receive the interest from the money which was paid for the redemption of the tax?—Yes, that would be saved.

8975. Supposing that were insufficient to meet the expenses of Government, what would you do then?—If the sources of revenue were insufficient, under the system which I advocate, to meet the requirements of Government, the same measures should be adopted as would be adopted now if they were found insufficient.

8976. What measure do you allude to?—A general increase of taxation.

8977. Did you not state that you were opposed to any increase of taxation, and, in fact, you said that you would not even educate the people or improve them if it necessitated taxation?—The question put to me was, if any taxation for the improvement of the civil government of the country was necessary, what I would suggest; and

Kasi
Shabudin.

30 June
1871.

Kazi
Shahudin.
30 June
1871.

and I said that if the people were unable to bear any additional taxation, I would rather not have those improvements in the civil government of the country than purchase them at the cost of the comfort of the people and at the risk of discontent among them; but as to any particular improvement, such as education, I am far from being opposed to it. Education is one of the best means of improving the wealth of the country, I think.

8978. I think you stated that the taxes were burthensome; what taxes are they that you consider burthensome?—I believe I said that, considering the income of the people, the taxes are heavy enough.

8979. What are the particular taxes that you referred to?—All the taxes put together; the land-tax, the salt-tax, the Customs duties; all the principal taxes, and all the local ones in the provinces.

8980. Do you think the land-tax a burthen?—It is not a burthen in itself; but all these put together are as much as the people can at present pay.

8981. But do you mix up the land-tax with taxes which are raised in other ways?—The land-tax is a portion of what the people pay.

8982. But do you consider it a burthen upon the people?—I mean to say that what they have to pay, all put together, is heavy enough for them at present. The land-tax in the Bombay Presidency is not very high in itself; but considering the produce per acre it is high enough, and any addition to it would be a burthen.

8983. When we are speaking of other taxes, what are the other taxes you consider as burthens?—All these taxes put together.

8984. Will you point them out?—The word "burthensome" is not what I would adopt; they are heavy enough, I would say.

8985. What do you think of the salt-tax?—I think that to a man who lives on 2 or 3 rupees a month the salt-tax is burthen enough.

8986. When you talk of 2 rupees a month, do you mean to say that that is the average wages of the people in Bombay?—In the Bombay Presidency the average income of the people is higher; you may take it to be 80 s. or 90 s. a year per head, but this is very unequally distributed; one man lives in great magnificence and another in poverty.

8987. Is not that the case everywhere?—It is; but there the masses live on a scanty subsistence.

8988. You cannot point out any particular taxes which are a great grievance?—No; I do not think any taxes taken singly are particularly heavy.

8989. Now is it not the fact, that in all ages the land has always been the resource of the Government for revenue in India?—Yes.

8990. Is it not the fact that the land ought to belong to the people of India, and not to any individuals; that the Government are merely the trustees for the people, and are the owners of the land as trustees for the people, for the purpose of paying the expenses of the governed, and that therefore it is for the benefit of the people that they hold it?—Yes.

8991. Under those circumstances, do not you think that if they have proper regard for the people, it is their duty to make the most they can of that land?—That will depend upon their requirements; they should regulate their taxes on land and on industries according to their require-

ments; they should distribute them equally, and not tax land to the utmost possible extent, and let others off without taxing them.

8992. Is anything like that done; land being taxed to the utmost extent and others let off?—I am giving a general answer to a general question.

8993. But if you have opinions of this kind, that great injustice is done in one case and not in another, you should point out the instances?—But the question was whether the Government ought not to take the utmost they can from the land; I do not think that they should do so.

8994. You are aware that the native Government used to do that?—Yes, in many cases; I have often heard here the British Government compared with native Governments, but I think it is very wrong to do so. Supposing that native Governments were oppressive, that is no justification for the British Government to be so.

8995. But if you make a charge against the present Government, it is only fair to compare the Government with those of the native states?—Well, it would be fair to do so, there is no doubt, if anybody said that we were better off under native Governments than we are under the British Government.

8996. We have the land assessed in Bombay at a 30 years' assessment?—Yes.

8997. Do you consider that a high assessment?—I have stated that the rates of assessment are not high.

8998. Then having let the land at a 30 years' assessment, if prices rise in the next 30 years, the Government have the advantage of an increased rental?—Yes, after the expiration of that term.

8999. And that increased rental is also for the benefit of the people, because it enables the Government to meet such increased expenditure as the necessities of the times call for, does it not?—Yes.

9000. Now, in the re-assessment of the land after the 30 years' settlement, is it assessed for improvements that are made on the land; supposing that you erect any buildings, for instance?—No; it is not to be assessed for any improvements made by the cultivator out of his own capital, or by his own industry.

9001. Then, in fact, if, when the land is re-assessed, no charge is made for improvements, is it not just as valuable to the owner of the land as if he had it himself, and it was his own?—Yes; but I must say that the cultivators generally have no confidence as to what may take place.

9002. That is not the fault of the Government, is it?—I do not think it is greatly the fault of the cultivators either, because Government have been making changes frequently, and introducing measures calculated to create distrust.

9003. What changes have they introduced about the land-tax?—There have been several changes; first of all there has been this one anna additional cess for education after the 30 years' settlement; this has upset their minds, and it is regarded as a breach of faith; because at the time of the last settlement on the part of the cultivators, so far as I know their feelings, it was understood that nothing further on any account whatever would be charged than the rates then imposed. Then the Nurwa villages are managed differently from what they were, and improvements made by the holders of Nurwa have been assessed. These and other changes of the country administration, such as those relating to Inam lands, or lands held in fee simple, have shaken

shaken their confidence; they do not know what they may expect at the next revision.

9004. Then you lay it down as a principle, that after the Government have made the assessment, they have no right to levy any further taxes?—Unless it was clearly made a condition when the assessment was being fixed.

9005. Now, supposing that the Government carry a railroad through a district, does not that improve the value of the land?—Certainly.

9006. Do you think that the people who derive that benefit ought not to be charged something for it?—Yes; they must pay for all benefits that they have.

9007. Do you think that Government are justified in borrowing money, and entering into engagements for making roads, and opening out rivers and irrigation, all of which would involve large expenditure and large responsibility, without having a claim upon the owners of land which will be benefited by these improvements; do you think that they would be justified in doing that without having the power to tax them for it if necessary?—Nothing that I have said shows that I wish to take that power from the Government at all; they have the power of taxing the people generally for all the requirements of the Administration. If by the system I have advocated, should there be any accumulation of capital, that would be as much liable to taxation as the land at present is.

9008. You have been complaining that the Government exercises its power of taxing people for the necessary wants of the Government, and for the improvements which you say they are not justified in making?—Certainly Government cannot tax improvements after fixed settlements, involving a promise that such improvements would not be taxed. If they taxed them, I should regard it as a violation of faith. But as the general power of taxation belongs to Government, and always will belong to Government, what I have said implies only a difference in the mode of taxation. Now, you derive a certain tax from land; you let the cultivator of that land redeem that tax, and improve his land without any fear of his improvement being taxed, and you can reach him by some other way.

9009. When a man is assessed on a 30 years' assessment; till that term has expired, he has no fear that he will have his rent raised?—This one anna education cess has been introduced during the currency of this 30 years' settlement.

9010. You object to that?—I do not object to it; I think the people are well able to pay it; it is a small addition to what they had settled to pay; but it has been introduced against the understanding, so far as the people are concerned, that no such addition would be made to the assessment.

9011. Are you of opinion that the people ought not to be educated?—I am not of that opinion; I am decidedly of the contrary opinion.

9012. Then, if the people ought to be educated, how can you oppose the Government raising the means of doing it?—I am not saying that Government ought not to raise money for educating the people; it is the mode of raising it that I object to.

9013. What mode do you suggest, then?—This education cess, as I have stated, has been introduced after the 30 years' settlement had been made with the people; consequently, it is

0.59.

regarded by those who are affected by it as a breach of faith; that is all that I say about it.

9014. Do you consider that it is a breach of faith?—I do certainly consider it a breach of faith.

9015. Then, if the Government cannot educate the people without raising this anna, you would allow the people to remain in ignorance?—I would rather that the Government should get out of the difficulty by some other means than by committing a breach of faith.

9016. What other means would you suggest?—I am not prepared to suggest other means than reduction of expenditure, besides the means I have already alluded to of increasing the produce of the country, such as irrigation, roads, &c.

9017. Your remedy, then, is a reduction of the present Government expenses; but assuming that the Government are unable to reduce their expenditure, what course would you recommend?—Certainly I would not recommend a breach of faith. Under the circumstances, even an income tax would be better than for Government to break their word; of the two evils, the income tax would be the lesser.

9018. But is it your opinion that an income tax could be raised without causing great dissatisfaction among the people?—Not at present.

9019. What class of people is it that the income tax most affects?—Immediately, it affects those who are not cultivators, although it affects some of the cultivators, too; but, in the Bombay Presidency, those who are not cultivators are mostly traders; and taxes paid by these fall indirectly on their customers.

9020. But if a person is assessed to the income tax he must be able to pay; because if he has had the income he can pay the tax?—Yes.

9021. In what respect, then, do you consider it unjust?—Only that its working is so unequal in the present condition of the people, particularly the ignorant masses.

9022. But the masses do not pay the income tax, do they?—In the Mofussil the traders may be considered ignorant; they are not educated.

9023. But is not the tax principally paid in the towns?—Yes; but there is only one Presidency town in the whole of Bombay; the rest are Mofussil towns, such as Poona and Ahmedabad.

9024. But those are large towns?—Yes; but there are few educated persons in them.

9025. You are aware that in this country there are people who do not like the income tax?—That may be so.

9026. Is there any other tax that you could suggest that would be less burdensome, or would be more approved by the people?—I think that, generally speaking, an indirect mode of taxation is better adapted to them now than any direct taxation.

9027. What do you mean by indirect taxation?—For which the tax-gatherer does not go to the taxpayer directly.

9028. What indirect tax do you mean to suggest?—I am hardly prepared to suggest any just now.

9029. [Sir T. Dazley.] You have admitted that there has been a great influx of bullion into India, and perhaps you are aware that as much as 200,000,000 £ sterling have been imported during the last 10 years?—Yes, I think that is the amount.

9030. And you stated also that still some taxes

Kazi
Shabudin.

30 June
1871.

'Kazi
Shabudin.

30 June
1871.

taxes are paid in kind?—Not in the British Provinces; only in Native States.

9031. Has that increase of bullion manifestly increased the circulating medium of the country?—Certainly.

9032. Then, how is that visible wealth manifested; how is it seen; where can it be discovered?—Among the masses it is visible in the improved mode of their living; all the cultivators of the land who, before the influx of bullion, and the increase of prices, lived almost in a state of poverty, are now better clad, and live better than they used to live formerly; in the place of earthen utensils some have now metal utensils, and so on.

9033. And in some cases silver utensils?—Only such silver utensils as drinking cups, and one or two plates; I am speaking generally of the cultivators.

9034. Have you heard of the circumstance of the cartwheels of cultivators being made of silver in Malwa?—No. I think in general prosperity the province of Gujerat excels, the other provinces; but I have never heard any thing like that in Gujerat.

9035. Have you heard of any increase of armlets and anklets of silver?—Yes.

9036. And are you aware that in some instances the women wearing them have been murdered for the purpose of obtaining the wealth?—I have not heard of women, but I have heard of children having been murdered. But such murders have of late become of rare occurrence.

9037. With such a visible increase in the wealth of India, is it not fair and just that there should be some tax paid by the possessors of that great increase of wealth?—That increase of wealth resulted, during a certain number of years, from an exceptional cause or causes; I do not think that there is any such progressive general increase of wealth as that.

9038. But you have yourself said that, during the last 50 years in tracing back the influence of price, you have seen that the price has been gradually augmenting, till at last even as much as 100 per cent. additional has been obtained?—I said that the prices were lowered during that period of great depression, which was from 1821 (or thereabouts) to about 1840 in the Bombay Presidency; the prices sank, I think, nearly 100 per cent. in some places.

9039. You are aware that a great difference exists between Europe and India with respect to national and domestic affairs affecting the welfare of the people?—Yes.

9040. Do you prefer the Indian to the European system and European conditions of life, and agencies for comfort, such as railways, common roads, canals, and so on?—No.

9041. You are not so enamoured of your village system as to wish to be deprived of European comforts and auxiliaries?—No; on the contrary, any improvement that I could suggest would tend to the increase of wealth and of these comforts.

9042. And you are an advocate of increased irrigation?—Yes, certainly.

9043. May I ask if you economise your manure in the city of Bombay?—In the city of Bombay it is not to my knowledge economised; it is not utilised for any purpose.

9044. Is manure applied to the soil in the district of Bombay?—Yes; it is chiefly cow dung.

9045. And where applied, do you see a great increase in the product of the soil?—Yes, it does increase the product of the soil.

9046. And therefore to economise the application of manure would be a national benefit in India?—Yes; I do not think there would be many cultivators who would use the night soil or the refuse drainage of Bombay.

9047. In China you know the night soil and every other kind of manure is made use of with great profit?—In the Presidency of Bombay there are people who would not object to using it, but it would not be used very largely.

9048. You have alluded to the increased price of cotton in your evidence?—Of cotton and of other produce too.

9049. And you are aware that even at the reduced price at this day the ryot is getting more than double the price that he obtained 12 years ago?—Yes, but the prices of cotton of late have been kept up by a spirit of speculation in Bombay, and there have been heavy re-drafts from England, and I believe many have been ruined by it.

9050. Are you not aware that the quality is better than it formerly was?—Yes.

9051. And that the price obtained is consequently higher?—Yes.

9052. And that the ryots are better acquainted with the prices ruling in England than they formerly were?—Yes.

9053. All of which would tend to cause an increased price and to give a permanency to that price?—The price of cotton will depend on other circumstances than its production in India itself. It will depend on the supply and the quality in America, for instance.

9054. I am glad to see that for the last few years there has been a rapid approximation between the value of the Indian cotton and the American cotton; you are aware that there has been?—There has been, but the difference is still great.

9055. There is no reason why it should not continue and become a benefit to the ryot, is there?—No, I see no reason.

9056. As you adopt European customs and manners, will you not of necessity increase your general expenditure very much?—Yes; I mean those who could afford to adopt them.

9057. You have no established poor laws in India?—We have no poor laws in India.

9058. You are aware that we have poor laws in this country which add very greatly to the local taxation of the country?—Yes.

9059. Then must you not look forward to a permanent increase of expenditure rather than a diminution of expenditure; if you are to enjoy these accumulations of wealth will you not need increased police, increased courts of justice, and all the elements of protection of life and property; and therefore will not your expenditure be in proportion greatly increased?—It would, under the assumed conditions.

9060. Then I fear what you call your economical system is not likely to be brought into practical adoption?—I am speaking of the present expenditure, not of what it may be prospectively.

9061. But if you are to improve your country, and enjoy the comforts that we have in Europe, you must increase the expenditure, must you not?—Yes; but you can hardly have any improvement

Kazi
Shabudin
30 June
1871.

provement without increasing the production of the country at the same time.

9062. By the establishment of railways and the facilities for works of irrigation, it is very clear that the value of the land has, according to your own admission, considerably increased?—Yes, where they have been introduced.

9063. Under a permanent settlement or a redemption of the land tax, it is very clear that the advantage of all those public improvements would be obtained by the possessors of such property?—Yes.

9064. Would it be perfectly equitable to permit the advantage of public improvements, which a possessor of land has not contributed to, to be enjoyed by him without some contribution to the State?—Certainly he ought to contribute.

9065. Mr. *Candlish*.] I suppose that Indians, like Englishmen, do not like taxation at all?—They pay their taxes as you pay taxes here. Whether they like taxes or not, is not material. But the question is, what are they able to pay?

9066. Is not the income tax one of the most odious of the taxes imposed in India?—I think so.

9067. Then, if you had to increase taxation, in order to effect education, would you put the taxation on in the shape of the most odious tax?—I said that that would be a better alternative than breaking faith.

9068. But you have some better ways of doing it still, than that, I presume?—There may be, I admit.

9069. Are you prepared to suggest what they are?—No, I am not.

9070. Do you consider that the income tax is honestly paid in India; I mean, do the natives give a truthful return of what their income is?—I do not think all of them do. It frequently happens that a trader returns a larger income than he actually derives.

9071. Why does he do that?—He thinks that the information will go out of the office of the assessor, and will damage his credit, if he gives his real income, and by giving a larger income he increases his credit, as he thinks.

9072. He makes himself thereby a larger man?—Yes; it is a fact that they do that sometimes.

9073. In many cases?—I cannot say in many cases.

9074. But many more the other way, I suppose; that is to say, returning a sum below the actual fact?—I think that those who return a sum below the actual fact are more than those who return a sum in excess.

9075. Mr. *Grant Duff*.] You have had some acquaintance with the administration of at least one of the native states?—Yes.

9076. Were you yourself employed in the administration?—Yes.

9077. Have you gathered there any hints that might be of use to us in our financial administration?—I think that the administration of the native states, differs from British administration in two essentials; the first difference is, that the administration in native states is in the hands of those who are born in those states, live among the people, and are amenable to public opinion, particularly of their own caste fellows; and, therefore, they do not give cause, if they can possibly help it, for any dissatisfaction against themselves; the other essential difference is, that in native states the people are seldom interfered with; that is to say, there are not such frequent

changes in laws, and in the modes of collecting revenue, and so on; then comes the question, whether these are advantages; certainly the first is a great advantage, viz., to know what the people think, and what they want; but the second I do not think would be practicable to the same extent in our British Provinces in which changes become necessary as civilization advances.

9078. But is there any practical hint that you could give us derived from your knowledge of the administration in the native states?—I am not at present prepared to do so.

9079. What native state administers its finances best, in your opinion?—I only know, personally, one native state, the one in which I am employed.

9080. But have you made any study of the British system of financial administration, as compared with the financial administration of any of the native states, either now or in past times?—I do not think that these native states have any fixed system of financial administration; anything like a system of finance, as we understand the expression, is not known there. Money is received generally according to a fixed mode of taxation, and is spent as it is required, particularly at the will of the ruler.

9081. In short, you think that we could manage our matters better; you think we could reduce our expenditure; but you cannot give us any other advice whatever?—Not any derived from the native states, that I am acquainted with.

9082. *Chairman*.] Did you find that the land revenue, in the native state of Kutch that you were connected with, was punctually paid either in money or in kind?—It is collected in kind; and, therefore, it must be punctually paid: because, as soon as the crop is gathered in the responsible official goes and takes the Government's share from it. Until the Government takes its share, no part of the produce is allowed to be removed from the village barn-yard.

9083. Mr. *Grant Duff*.] Do you prefer that arrangement to ours?—No; I prefer a cash system to payments in kind.

9084. *Chairman*.] According to the native system, the person pays revenue exactly in proportion to the skill and industry that he exercises in cultivating his land?—Yes.

9085. Whereas, according to the English system of paying a fixed sum in money, anything that he acquires from his own skill and industry, goes into his own pocket?—Yes; but at the same time he pays in seasons of scarcity too; whereas, in Native states they do not pay anything when there is no produce.

9086. That applies to the natural produce in the natural seasons; but I am speaking of the results of superior industry and good cultivation, and the use of money in cultivating his land. According to the Native system, they take a share of all that; whereas, according to the English system, they do not take any portion of that, but the revenue remains fixed for the 30 years?—Yes; and even after the 30 years, if the Government strictly adhere to the terms of the present arrangement, they will not impose any additional assessment for the results of industry and skill.

9087. You understand that the English system in Bombay is one of assessment on what are called the natural elements of the soil, and other circumstances of that kind?—Yes.

9088. But notwithstanding that the revenue

Kazi
Shabudin.
—
30 June
1871.

is collected in kind, have you never heard that in the Native states they have difficulty in getting it, and are peculiar in finding means for compelling the cultivator to pay?—No.

9089. But have you never heard of very coercive means being employed in the Native states, in Kutch?—No; I have neither seen nor heard it.

9090. Did you never hear of any singular steps being taken to make the natives in the Native states pay the revenue?—No, I have not heard it; nor are any such steps necessary under their system.

9091. But apart from that system, did you never hear of the Native states in and near Kutch taking very oppressive measures to exact their revenue?—No, I do not think the Native States I am acquainted with experience any difficulty in collecting their revenues. Coercion might be occasionally resorted to for the realisation of fines, penalties, or other demands, but it is not employed as respects the ordinary revenue.

9092. Mr. Fawcett.] I understood that you advocate the redemption of the land tax only with regard to the ryot or cultivator, and the advantage you would gain in that way would be to convert them into peasant proprietors?—Yes.

9093. But do you contemplate any means that would secure to them the possession of the land. What is there to prevent a land speculator coming and buying up the proprietary rights of a lot of these men?—The revenue officers would take the necessary precautions to prevent that.

9094. But could any precautions be taken, which would prevent it, if the land tax were once redeemed, the holding passing out of their hands?—The only guarantee against that is the great attachment of these cultivators to their lands.

9095. But, supposing that times of scarcity came on, or anything like that, and they wanted to raise money upon the land, and it got mortgaged, you could by no law prevent these lands from being sold, could you?—No; nor would I. At present the right of holding land is so disposed of on mortgage whenever necessity arises.

9096. But then that right is frequently disposed of, is it not?—No, not frequently; a cultivator of land will do anything but part with his land, if he can help it.

9097. But then supposing that this land became, for instance, owing to increased value extremely valuable; how would a father apportion it amongst his children; would he go on constantly subdividing it?—Yes, just as he does now.

9098. When you say that you would prefer an indirect tax to the imposition of an education cess, or an income tax, I suppose you would prefer even an increase of import duties, or an increase of export duties, such, for instance, as the export duty on cotton, rather than that we should, as you say, break our word with the people?—I have not studied the subject of import and export duties.

9099. Chairman.] Will you explain what class of persons you spoke of when you stated that the rate of wages was 2 rupees a month in Bombay?—The poor classes in the interior of the Deccan and Concan.

9100. Do we understand you that the rate of wages in any part of the Bombay Presidency is now 2 rupees a month?—Yes; sometimes it is 4 annas a day, but in the interior of the Deccan and Concan, there are, I believe, labourers who work on 2 rupees a month; particularly in fields.

9101. Do you mean that that is their whole income, or that that is in addition to land which they possess and cultivate themselves?—In the Concan the land is subdivided to a great extent, and such persons possess only very small patches, which do not yield them much.

9102. What is now the rate of wages in the town of Bombay for any particular class?—A common labourer, I think, earns 6 annas a day.

9103. And do you think that the rate of wages still remains in any part of the Concan at 2 rupees a month for a month's labour?—Yes; those who work in the fields in their own villages, and do not go to Bombay (the Bombay labour market is supplied generally from the Concan), earn very small wages.

9104. I want to know whether that is the whole of their income, or whether it is only wages paid for certain services during a part of the month and part of the day?—They are engaged generally by the day, or if they are agricultural labourers they are engaged for the season. But the land in the Concan, which these classes generally cultivate in patches, is so unproductive that they do not make much more.

9105. What wages are paid now, in any part of the Concan which you know, to what you may call the ordinary labourer?—I do not think that it is more than an anna and a half a day. In towns it is more.

9106. Sir C. Wingfield.] But is it not the practice very often to give food as well; wages are often paid in India partly in money and partly in food?—Yes; when they are engaged for the season they generally stipulate for food (which is of the coarsest kind), and for a cunlee or two.

9107. Mr. Fawcett.] How much salt will such a man consume, an ordinary man and his family?—I think one man would consume about 28 lbs. a year.

9108. Suppose it was a family of a man and his wife and two young children, they would consume 100 lbs. of salt in a year?—The children would not consume so much as adults.

9109. How much would you say the family would consume?—Take a family consisting of five persons, adults and children, I think they would consume about a maund of salt in a year.

9110. What duty would there be upon that?—The duty up to 1869 was 1 rupee 13 annas. I do not know to what they have increased it lately.

9111. He pays at least 2 rupees in salt duty?—I believe so.

9112. How much should you say that such a man would earn; 2 rupees a month?—Yes, about that.

9113. Then it would represent a tax of 8 per cent. on his income?—You are taking the earnings of one man, and the salt consumed by a whole family; but then the wife sometimes works, and the grown-up children work too; they earn a little; women earn less than men, but they do earn something.

9114. Could you give an idea of the average earnings of such a family?—I am not just now prepared to do so.

9115. Mr. Cave.] How many hours make a day's labour?—They work from 8 till 12, and then they have one or two hours to themselves; after which they work till the evening.

9116. Have they time to work on their own land?—When they are engaged on their own land they do not go and labour for others.

9117. Then

9117. Then are there no instances of people working for wages and also working on their own land?—Some few, when they have nothing to do in their own fields, go and work in others' fields, the crops being different.

9118. Not on the same day?—No.

9119. Is there much land mortgaged round Bombay?—Among the ryots who cultivate what we call the Government land it is not much mortgaged, but among owners of land it is done to a great extent.

9120. But those owners let their land to somebody else, I suppose?—Yes, they generally do not cultivate their own lands.

9121. And what is the rate of interest paid for those mortgages on land generally?—It depends upon the quality of the land, and its situation.

9122. The amount of the mortgage depends upon the quality, I suppose, but not the rate of interest, does it; the rate of interest would be the same, would it not, on all land?—The rate of interest for mortgages on land varies; but it is lower than on other property. On land it varies from 4 to 6 per cent., or even a little higher. In some places it is even lower than 4 per cent. A man would readily advance money on land at a lower rate of interest.

9123. Will they advance money on Government security at as low a rate of interest as on land?—Those who advance on land are small capitalists in the interior, and not of the class who take up Government securities.

9124. But would they advance money on Government securities at as low a rate of interest?—No, not on Government securities at as low a rate of interest as on land.

9125. The ryots, you say, do not mortgage their land?—Not generally.

9126. If they do, they have great difficulty in living and paying the interest?—Yes; land being their only source of income.

9127. But if the land is mortgaged for a sum beyond what the ryot can pay, does he transfer his lease of the land to somebody else?—Such cases occur.

9128. Sir C. Wingfield.] Do you consider that

the natives are happier in a well-governed native State than in the British territories?—I have not been in those native States which are considered model States, and therefore I would rather not give an opinion.

9129. Mr. Birley.] You say that the rate of interest on land mortgaged is from 4 to 6 per cent.?—In some parts of Gujerat, where the cultivators are better off than in other parts, it is even lower than that.

9130. And what would they lend money for on Government securities?—I have hardly an idea.

9131. Mr. Candlish.] Did I understand you correctly to say that the cure for many of the ailments of India would be economy on the part of the Government?—Yes.

9132. If we get a high Government official here to say that the expenses of Government cannot be reduced, could you tell him how to reduce them?—I could, if required, go over the expenditure, and consider every item.

9133. Have you any doubt that the Government expenses could be reduced without diminishing Government efficiency?—So far as my knowledge goes, I think that there is great room for reduction in certain departments.

9134. If asked, would you be prepared to state here where you would effect the reductions?—I have stated the principal departments already.

9135. Would you regard such evidence as you have to offer on that head as important evidence, more important than other evidence such as you have given here to-day?—I am not at present prepared with facts.

9136. When you say that economy would be of advantage to India, are you not in possession of facts to justify you in making that statement?—I was in the Government service for 13 years, and I have observed the working of those departments; I have mixed with people in, and connected with those departments, and my knowledge and impressions are derived from that source.

9137. Would you wish to give evidence on that head?—I am not sufficiently prepared, at present, to do so.

Kazi
Shabudin.

Mr. Fawcett.
Mr. Robert Fowler.
Mr. Haviland-Burke.
Sir Wilfrid Lawson.
Mr. Lyttelton.
Mr. McClure.
Sir Stafford Northcote.
Mr. J. B. Smith.
Sir David Wedderburn.
Sir Charles Wingfield.

THE RIGHT HONOURABLE ACTON SMEE AYRTON, IN THE CHAIR.

Mr. THOMAS LAWRENCE SECOMBE, C.B., recalled; and further Examined.

Mr.
Secombe,
C.B.
—
4 July 1871.

9138. *Chairman.* | Will you be good enough to give the Committee information respecting the receipts of the Home Treasury on account of the Indian revenue for the financial year 1869-70, under the head of "Miscellaneous"? — The first item under the general head of "Miscellaneous" is "interest realised from the investment of cash balance, &c." 25,056 £.; that interest is obtained for certain sums lent from the balance of the Secretary of State in Council, at a rate generally of about 1½ per cent. below the bank rate of discount. The sums are lent for periods of from one month to six weeks, so as to be available whenever they may be required for the purposes of the Home Treasury.

9139. Will you explain the next item? The next item is a receipt from the Imperial Treasury, 10,091 £., being a portion of the rent of the telegraph cable between Malta and Alexandria. That cable was constructed originally for the Imperial Government as a line from Falmouth to Gibraltar; but being too heavy, it was agreed between the Lords of the Treasury and the Secretary of State for India, in the year 1860, that it should be laid at the joint cost of the two Governments between Rangoon and Singapore. It was shipped with that object, but the consignment on one ship became heated, and the cable had to be landed; the season was then lost, and it was laid in 1861 at the joint expense of the two Governments, between Malta and Alexandria, the Imperial Government bearing three-fifths and the Indian Government two-fifths. It was then leased in 1861 to Messrs. Glass & Elliot at a rate dependent on the profits obtained by working the cable. It was subsequently, in 1868, leased to the Anglo-Mediterranean Telegraph Company, and a rent was received of 2,000 £., of which the Imperial Government paid us two-fifths. The telegraph company gave notice on the 17th October 1870 of the termination of the lease,

and the telegraph has been sold by the Treasury to the company for 25,200 £.; the company has also to pay 1,000 £. rent due, and a penalty of 5,000 £. for not repairing the cable, altogether 31,200 £., of which India will receive two-fifths. The total amount paid by India on account of the cable has been 176,947 £., and we shall have received altogether, including the sum of 10,091 £. shown in this account, 61,001 £., so that India sustains a total loss of 115,946 £.

9140. Mr. *Crawford.* | What was the date of the arrangement under which the cable was first made? — In 1859 it was constructed for the Imperial Government, not for India.

9141. That was immediately after the Indian Mutiny; was it not greatly in consequence of the necessities shown by the state of things at the time, that the making of that cable was entered into? — I believe it was.

9142. Sir C. *Wingfield.* | Does that outlay which you have mentioned include the total cost of sending the cable out to Rangoon, and coming back again? — The total cost to the Indian Government.

9143. *Chairman.* | Will you pass to the next item of account, 11,658 £.? — That consists of fees and subscriptions to widows' funds of the home establishments. The fees received for certificates of death of officers and others in India, granted by the India Office, and on other accounts included in that sum, amount to 663 £. The dividends on stock, the property of the widows' funds, invested in the names of the trustees, were 8,297 £.; and the subscriptions paid by members of the widows' funds amount to 2,698 £., making up the total of 11,658 £.

9144. For what class of widows is this fund kept? — There were two funds instituted by the Court of Directors of the East India Company, to include different classes of their servants; the one for officers and clerks, the other for an inferior class of clerks and messengers. When the

the change of Government took place, it was deemed expedient to discontinue those funds, especially as there were then greater facilities than formerly for insuring lives; and the Secretary of State guaranteed to the subscribers the pensions which were provided by the rules, and closed the funds, so that no further entries to the India Office of clerks would bring them within the scope of the funds.

9145. Do you mean that the clerks would have no superannuation?—These are only funds for widows and orphans, not for superannuation.

9146. *Mr. Cave.*] Does that include the Clive Fund?—No, that is quite distinct; these are civil not military. I should mention that the trustees of these funds hold a considerable property, amounting to 282,734*l.*, which is invested in stock, and will eventually become the property of the Secretary of State in Council, but at present the funds involve a considerable annual charge.

9147. *Mr. Dickinson.*] This is not a part of the fund made over by Act of Parliament?—No.

9148. *Chairman.*] And then the officers in the India Office will be on the same footing as other public servants; they will get superannuation, but their widows and children will not be provided for?—Quite so.

9149. Does the item of 1,194*l.* for the "sale proceeds of unserviceable stores" refer to stores used in England, or to what does it relate?—It consists of a variety of items. It is the practice of the Government of India to send home for assay gold and silver coins; when they have been assayed the remaining gold and silver is sold, and the proceeds form a small portion of this sum. Part of the receipts is for telegrams to India, which had been included in the office bills, but have been paid by individuals; part consists of sums received from the librarian for surplus books of the Indian Office Library; which had been sold, amounting to 295*l.*; the refund of an over-payment on account of the services of an individual in the Paris Exhibition, which had been checked on audit, is another portion; and there are a number of very small items.

9150. Will you be good enough to explain the meaning of the item of 78,000*l.* "subscriptions to the Indian Military Funds"?—Under the rules of the several military and medical funds, which have now been made over to the Government, officers in this country have to pay the subscriptions due from them so far as regards the medical funds, with a view to their own annuities, and so far as regards the military funds for widows and children; and this sum of 78,771*l.* is the aggregate of those subscriptions during the year.

9151. Will you explain in what manner the receipts of 22,000*l.* on account of the army arise?—The first item of 4,864*l.* is a receipt from the War Office, on account of clothing for a period from 1st April 1859 to 31st March 1862. Under the arrangement for clothing the troops at that time, the Government of India paid a rate to the Imperial Government, and this was an amount which had been unduly charged then, and which has been subsequently admitted by the War Office here, and paid over.

9152. *Mr. Dickinson.*] Without interest, I suppose?—Without interest.

0.59.

9153. *Chairman.*] Are these items under the same head, all refunds on adjustment of account?—Yes; when a regiment returns from India the clothing in possession of the regiment, being the property of the Secretary of State for India in Council, is valued by a committee, and the amount is paid over to the India Office. One item which is included in the sum of 17,254*l.* is 8,696*l.* on that account, and the proceeds of sales in England of unserviceable stores brought from India, old ordnance, &c., and some other minor items, make up the total amount.

9154. What is the explanation of the sum of 10,244*l.*, "In repayment of excess of working expenses over traffic receipts of the Jubbulpore line"?—The Jubbulpore branch of the East India Railway did not pay its working expenses in the half year which ended on the 30th June, 1869, and that sum of 10,244*l.* was paid over to the Government of India on that account.

9155. *Mr. Crawford.*] The East India Railway Company's system is worked under two separate contracts by the Government of India; is it not?—Yes.

9156. And this item of 10,244*l.* 7*s.* is the sum, ascertained upon the form of accounts prescribed by the Government of India, of loss upon the working of the Jubbulpore branch?—It is.

9157. And it was repaid as loss to the Government out of the earnings of the main line of the East India Railway Company?—Yes.

9158. The loss means that the sum so repaid was in excess of the receipts of the company, after having received from the Government 5 per cent. upon the capital included in that part of the system which belonged to the Jubbulpore branch?—Yes.

9159. Were the Government and the company at one as to the principle on which that account was made up?—I am hardly able to give the Committee information upon that point; it in no way comes within the financial department; it would be a question for Mr. Danvers.

9160. You merely speak as to the fact of the item here?—I am only dealing with the financial result.

9161. *Mr. Carr.*] Does that 10,091*l.* of rent for the telegraph cable go in reduction of the 115,000*l.* that you mentioned just now?—That 10,091*l.* is included in a receipt of 48,520*l.* which had been obtained by the Government of India, and two-fifths of the 31,200*l.* still remain, making a total receipt of 61,001*l.* against their expenditure of 176,947*l.*

9162. And that leaves a loss of 115,000*l.*, but what I want to know is whether this rent will continue; is it an annual rent to be paid?—That is the close of the whole transaction. The cable is sold, and there is nothing more to be received.

9163. Does this 78,000*l.*, under "Subscriptions to the Indian Military Fund," include the subscriptions to the Clive Fund among others?—There are no subscriptions to the Clive Fund. It includes subscriptions to the Bengal Military Fund, the Bengal Military Orphan Society, and the Bengal Medical Fund, the Madras Military Fund, the Bombay Military and Medical Funds, and the Indian Navy Fund.

9164. Has the Clive Fund been assumed by the Indian Government?—Yes; though nominally Lord Clive's Fund, the expenditure has for many years been greatly in excess of the amount produced by the gift of Lord Clive, and that continues still as a charge without any receipt

Mr.
Seccombe,
C.B.

4 July 1871.

Mr.
Secombe,
C.B.
—
4 July 1871.

receipt on the other side except unclaimed prize money.

9165. There are no subscriptions, to that, but only certain receipts?—Only unclaimed prize money.

9166. But the Indian Government always makes a subscription in aid of the funds produced by the capital, I suppose?—The plan formerly was this, that Government brought to account the interest of the grant by Lord Clive, and paid pensions on a certain scale without regard to whether they were covered by receipts or not, and they greatly exceeded the receipts.

9167. *Chairman.*] Do those receipts, amounting altogether to 201,720*l.*, compose the whole of the receipts on account of the revenues of India obtained in England?—They do.

9168. But the Home Government or the Secretary of State for India in Council in addition receives large sums of money for the purpose of meeting other expenditure?—At page 2 of the Home Accounts those transactions are shown, the transactions by which the Secretary of State is placed in funds to meet the total disbursements in England.

9169. *Mr. Fawcett.*] I understand that this telegraph cable that you refer to laid down between Malta and Alexandria, was originally the cable of an English telegraph company, belonging to the English Government, and that the Indian Government ultimately obtained a share of a very bad speculation. Who advised them to do so?—It was done in correspondence with the Treasury.

9170. And was it thought at the time to be a good bargain for India?—It was thought to be desirable for Indian interests.

9171. But it proved exactly the reverse, did it not?—Certainly.

9172. Did they consult any authorities before entering into a large speculation like that; were there any opinions taken of persons practically acquainted with the subject?—I am not able to state whether the opinions of practical persons were taken on the subject, because it was not done through the department with which I am connected; but there can be no doubt generally that the Treasury are exceedingly jealous in regard to incurring expenditure, unless it is likely to prove advantageous.

9173. But supposing that the Treasury in Downing-street is anxious to get rid of a bad speculation, and make India pay part of the money, who protects the interests of India?—The Secretary of State for India in Council.

9174. But the Secretary of State not being personally the least judge of the value of a telegraph company, does he, before entering into a heavy commercial speculation like this, take the opinion of practical men?—He has in his Council able men whose attention has been directed to telegraphs.

9175. But is there any man on the Council who has a practical knowledge of the engineering work of the telegraph?—Yes, it is considered that in the Council there are one or two able men on those matters.

9176. Then I should like to obtain some evidence from them as to who recommended this purchase; who would probably be able to give that evidence?—If the Committee desired to go into that question, I think that the head of the telegraph department should be here, and

the members of the committee whom he represents.

9177. Who is the head of that department?—Mr. Thornton.

9178. But then Mr. Thornton, as far as I understand, has no practical knowledge whatever of telegraphy, but he is simply a gentleman who has been brought up since early life in the India Office, is he not?—He is.

9179. Then he is not a person whom you would consider to possess any practical knowledge as to telegraphy, would you?—On all questions on which it is considered that information of a technical character is required, it is always obtained by the Secretary of State in Council.

9180. I want to know upon whom you fasten the responsibility of making this excessively bad speculation; of course, if the Secretary of State of the day took trouble to consult some man whose practical knowledge would be considered valuable, the responsibility would be his; could you furnish any memorandum which would justify the Secretary of State at the time in making this unfortunate purchase?—Yes, I could easily furnish a memorandum on the subject; but there can be no doubt that the responsibility rests with the Secretary of State in Council and the Lords of the Treasury.

9181. Yes, but what I want to come at is this: the Lords of the Treasury and the Secretary of State have two directly antagonistic interests; supposing that the Lords of the Treasury discover that they have got themselves involved in a very bad pecuniary speculation, and they want to put two-fifths of that, as seems to have been done in this case, on the people of India, what man is there with practical knowledge to protect the interests of the people of India?—In all large questions the Secretary of State in Council carefully considers them before he sanctions expenditure, and obtains such information as satisfies him that it would be properly incurred.

9182. I want to know what steps they take to do that; no one would pretend to say that the Secretary of State, a man usually brought up in public life, could from his own knowledge say whether 1,000,000*l.* or 2,000,000*l.* ought to be paid for a particular telegraphic line; whom does he usually consult to ascertain whether the line ought to be bought at all, and if so, what price ought to be paid for it?—I think that the only course for me to pursue in this case would be to submit a memorandum to the Committee explanatory of the process by which the Secretary of State arrived at the conclusion that it was proper to assent to the arrangement in question.

9183. *Chairman.*] You are speculating as to what might be done; the honourable Member is asking what was done in this particular case; do you recollect what was done in this particular case?—I do not.

9184. *Mr. Grant Duff.*] It would be no part of your official business?—No.

9185. *Chairman.*] It would be the duty of Mr. Thornton to know what was done in this case by the Secretary of State?—Yes.

9186. *Sir S. Northcote.*] The Council of India is divided into committees, is it not?—It is.

9187. And upon those committees there are gentlemen who are supposed to be peculiarly cognisant of the subject-matters referred to them

them as among the members of the Council?—Yes.

9188. The department of the office which would have had cognisance of any such transaction as that of which we are now speaking, is the department which Mr. Thornton represents in the office, and which is represented in the Council by a committee which superintends questions of railways and telegraphs, is it not?—It is.

9189. Therefore, as regards information as to the steps taken to obtain further light upon this question, I understand you to say that it would be better that the Committee should consult Mr. Thornton, or the members of the committee who were responsible for that department?—I so put it to the Committee.

9190. Mr. Fawcett.] Then there is another point in connection with this, on which I should like to examine you. I understand that now the thing has been finally disposed of?—It has.

9191. What is the amount which India has received?—The amount of the two-fifths of the purchase money, rent and penalty, to be received by India is 12,480 £.

9192. You put that 12,480 £ down to income?—Yes, it will be credited to income; the 10,091 £ is included in a sum of 48,520 £, which was received before the final sale of the telegraph.

9193. But then considering that this represents property which probably was bought partly by borrowed money, do not you think that if the accounts were kept correctly it ought to be put down to capital account, and not to income?—A Government has no capital account; the disbursements on this account have, in former years, been entered as charges; and it is the principle on which the accounts are kept that all gross receipts and charges during the year shall be brought to account as receipts and charges of the year.

9194. That is the most important point that I wish to get at. I understand you distinctly, that, although the Indian Government is constantly borrowing, they have no capital account?—They have a debt account.

9195. But no capital account?—No capital account.

9196. I will put this case: suppose (which is a perfectly possible case) that the Government of India borrows 500,000 £ to purchase a telegraph or a railway company; turns out a bad speculation in two years time, or a good speculation it may be, and they think it necessary to sell it, and they sell it for 400,000 £. According to your statement that 400,000 £, representing what has been obtained as borrowed money, is put down to income in the gross receipts?—Yes, if the expenditure had been included among the charges the receipts would be included among the receipts.

9197. Can you justify such a method of keeping accounts?—It is, I think, the accepted form of keeping accounts in the present day.

9198. By any merchants?—No, but I believe by the Imperial Government as well as by the Government of India.

9199. I should say that it was unjustifiable for any Government to do it. But do not you see a fundamental distinction to be drawn between a Government which usually has a surplus, and a Government whose normal condition is one of borrowing and deficiency, which represents the financial condition of India?—The generally admitted principle, recognised by the Government

of India in regard to borrowing, is, that it shall be only for public works extraordinary, of which an account is kept, and that, except in regard to that expenditure, the charges of the year, for ordinary purposes, shall be kept within the income of the year.

9200. But when was this rule laid down that they should only borrow for public works extraordinary?—It was first distinctly laid down about the time when the Secretary of State agreed to separate public works extraordinary from the general expenditure of the Government.

9201. When was that done?—When Lord Cranborne was Secretary of State for India.

9202. But, for instance, this telegraph was bought in the year 1859-60, and in that year this distinction, that public works extraordinary only should be constructed by borrowed money, had not been laid down?—It did not exist then.

9203. Considering that in the year 1859-60 there was a very heavy deficiency, as I understand, and a considerable amount added to the Indian debt, can you state whether this telegraph was not bought with borrowed money?—There is no doubt that telegraph, like all other expenditure, being included among the charges of the year, if there be a deficit on the transactions of that year, either the Government must borrow money or it must reduce its cash balance.

9204. Then I am correct in saying if there was a heavy deficiency in that year, that this telegraph was bought partly with borrowed money?—In the year in which that expenditure was incurred the Indian Government had to borrow largely.

9205. They had to borrow 10,000,000 £, had they not?—The deficit, I think, was 10,700,000 £ in that year.

9206. Then what the statement really comes to is this; you borrow money to buy a certain thing; you sell that thing at an enormous loss, and then, having added to your debt, you, in consequence of buying it, instead of appropriating the proceeds to reducing the debt, you put them down to income as if they were an ordinary receipt?—Expenditure on any work having once been included among charges, if, by means of a sale of a portion of it, or by the rent of it, a sum be obtained, it has certainly been carried to the receipts.

9207. Yes, but after all that is a totally different thing; you sell the thing, therefore the thing can never recur, and then you put that down (that is a different thing from the regular income derived from it) as an ordinary receipt of income?—We do.

9208. Is there any security, for instance, that any year a million may not be borrowed and added to the debt, and that in order to obtain a surplus you may not sell what you have bought at a million for 700,000 £, and in that way make out your accounts as extremely satisfactory?—There may be some objection to the present system of account on the grounds that you urge; there can be no doubt that every year we find in our receipts as well as in our expenditure certain exceptional items which are not proper to the year, and tend to give an erroneous view, if it be assumed that the statement is of annual receipts and charges of a normal character.

9209. But you are probably aware that these exceptional receipts put down as income have,

Mr.
Secombe,
C.B.
4 July 1871.

Mr.
Seccombe,
C.B.

4 July 1871.

in some years, been so large as to vitiate the whole accounts, so that owing to that fact you can place no confidence whatever in the financial statements as to the financial position of India? —I should hardly agree to your view that you can place no confidence in the accounts, because it has been deemed to be the best mode of bringing to account, in the simplest form, all receipt and expenditure; I admit that it is not safe to take up an account of any one year, and, without considering what are the exceptional items, to assume that that is the normal state of Indian finance.

9210. I wish to put this before you in order to illustrate the serious nature of the thing; you are probably aware, having looked into the account of what was stated the other day by the Comptroller General, that last year if the accounts of India had been properly set out there ought to have been stated a deficiency of 660,000*l.* instead of what was stated, a surplus of 118,000*l.*?—I saw the statement of Mr. Harrison's, to which you refer, and he admitted rather more than I should be disposed to admit; because in that very year there was an expenditure on account of barracks of upwards of a million, which was not an ordinary charge of the year.

9211. Does it come under your department at all in any receipt that you may receive from the Imperial Government (and you define the Imperial Government, I understand, to mean the English Government) to see that it is a proper receipt, that it is enough, in fact: who is there to look after that; does it come under your department?—Yes, as a general rule.

9212. You referred to a disputed receipt which has been at length paid to you by the Imperial Government of 4,000*l.*?—On account of clothing.

9213. That amount has been due to you for the last 10 years, has it not?—Yes.

9214. Then India has been deprived for that time of the interest, has she not?—Unfortunately our accounts with the Imperial Government are of a somewhat complicated character, and a balance of a much larger amount than 4,000*l.* is occasionally standing on either side. That 4,000*l.* entered into a general series of transactions which, after undergoing careful audit, have at last resulted in the Imperial Government admitting that they are liable for the amount.

9215. Have you any plan for settling a claim so as to bring it to a conclusion in less than 10 years; do you adopt any plan of having referees, for instance?—It has never been found necessary.

9216. But supposing that in this case this thing has been disputed for 10 years, and there has been a great deal of correspondence about it, could not the thing have been settled at once by the plan I suggest?—There has been but little dispute about it. There have been several changes in regard to the mode of paying for clothing, and the charge had been lost sight of in India, and when reported home it formed the subject of correspondence.

9217. But who in the last instance decides the dispute, supposing you do not agree?—If there is no agreement it becomes then a question to be laid before the Secretary of State in Council as to what further steps shall be adopted in regard to it.

9218. There is no one who can act as an ultimate referee; supposing the Lords of the

Treasury say that the amount is not due, and the Secretary of State says that it is, there is no power then to compel payment of the money, is there?—No; but it hardly ever reaches a stage of that kind.

9219. But a high official connected with India has publicly made the statement that the financial interests of India are constantly being sacrificed, owing to the fact that the English Government make India pay for things that they ought not to pay for, and do not pay them for things which they ought to pay them for; who is to protect India from that?—I should not be disposed to take that view myself.

9220. I will quote the exact words; Mr. Laing not long since stated, in a letter which he wrote to the "Times," that Indian finance was constantly being sacrificed to the exigencies of English estimates and the wishes of the Horse Guards?—That, of course, is but an opinion of Mr. Laing's, from which I would venture respectfully to differ.

9221. You think that there is no ground for it?—I think it is very necessary that Indian interests should, in those intricate matters of army expenditure, as in all others, be carefully protected by the Secretary of State in Council, and I think they are as a rule.

9222. Mr. Grant Duff.] In case of a difference of opinion between the Secretary of State for India and the Treasury, with regard to which they cannot come to an agreement, I suppose the matter would be referred to the whole Cabinet, would it not, and the Cabinet would arbitrate?—I presume so.

9223. Mr. Fawcett.] But you are probably aware that the gentleman to whom you have referred, Mr. Thornton, expressed an opinion with regard to the telegraph expenditure, that the Indian Government paid a great deal too much, and the English Government a great deal too little?—Yes, I am aware that Mr. Thornton expressed that opinion.

9224. Does the amount which the English Government, or the Indian Government, ought to pay come under your department at all?—Yes, questions of that nature do as a general rule; but I am only an officer of the Secretary of State, my duty consisting in obtaining proper materials, placing them together for his information, and submitting them with any suggestions that I may have to offer.

9225. But in the cases to which Mr. Thornton refers, did you represent to the Secretary of State that you thought India was paying too much?—No. The cases to which Mr. Thornton referred did not come under my department at all; they were dealt with in Mr. Thornton's own department.

9226. And he was the responsible person to point out those things to the Secretary of State?—Certainly.

9227. There is a Blue Book annually laid before Parliament, and which I hold in my hand, which contains a statement, and almost an authoritative statement, I suppose, of the financial position of India; it gives the gross receipts, the gross expenditure, and the deficit. I suppose you are responsible for the preparation of that Blue Book?—No, I am not responsible for that document, or any part of it. I am aware that while it has been compiled with considerable industry, there are certain errors in it which it would be desirable to correct.

9228. But

9228. But you being aware of those errors, it was laid before Parliament for Parliament to form an accurate opinion of the financial position of India; I hold in my hand certain other Blue Books which, no doubt, you are perfectly familiar with, which contain a statement of the actual financial position of India, as compiled at Calcutta on the same principle?—I had not seen the Blue Book, which was prepared in the India Office previous to its being laid before Parliament, and was consequently not aware that it was inaccurate. I have seen the Blue Books which were compiled at Calcutta.

9229. You are probably aware that almost every year there is the greatest possible discrepancy in the accounts contained in the book which is issued at the India Office and the book compiled at Calcutta?—Yes, I am aware that in certain early years there are great discrepancies in them.

9230. In some years it amounts to as much as 2,000,000 £., does it not?—It may be so.

9231. When you say that it is in the early years, that discrepancy has continued up to the present time, has it not?—I think not up to the most recent years.

9232. In some of the latest year of which we have any complete account, I refer to 1868–69, there is a discrepancy, is there not, of a million?—I have not so closely investigated it, as it clearly does not come within my department, but when I looked at it some little time ago, and saw that there were many errors, my impression was that 1867–68 and 1868–69 were correctly given.

9233. I want particularly to examine some one on that; if you are not responsible for it I will not press you, but who is responsible for these discrepancies?—The gentleman whose name is attached to that book is responsible; it is Mr. Hornidge, the Statistical Reporter, who knows that there are serious errors, and regrets very much that they should exist.

9234. Not only Mr. Hornidge must have been aware of them, but every one connected with the finances at the India Office must have been aware of them, I presume; should they not have been pointed out, under those circumstances?—You may probably think that I should be one of the first to discover these errors, but I can assure the Committee that the labour of my own department is such that I cannot take up every document sent out from the office, and see that it entirely agrees with those statistics which I myself should put forward.

9235. I do not wish to fasten the responsibility at all upon you individually, but as a matter of fact, does it not seem extraordinary that a Blue Book giving a most detailed statement of the accounts should be published in Calcutta, and another Blue Book published by the India Office in London, and that these grave discrepancies should take place every year, and that no one should have noticed them, or directed attention to them?—I have already said that the gentleman whose name is attached to it very deeply regrets that the errors should have occurred.

9236. Perhaps you are aware that owing to these discrepancies in the account, when the right honourable gentleman, the Member for North Devon, was Secretary of State for India, they were obliged to alter a resolution which was about to be passed in the House of Commons, and owing to the incorrectness of the accounts they were obliged to make the resolution

run in this way: "It appears from the accounts which have been laid before Parliament of the financial position of India," that so-and-so?—Yes, I am aware that the resolution was so modified.

9237. In consequence of the incorrectness of the accounts?—It is not my impression that it was in consequence of the incorrectness of the accounts, but that it was asking the House to affirm that which only appeared from the accounts.

9238. If you refer to the debate which took place in 1865–66, you will see that the resolution had to be altered in consequence of a certain incorrectness in the accounts, and although that took place five years since, the incorrectness and these serious discrepancies still continue?—But on the occasion to which you refer, that little book now in your hand, was not at all in question. The error, I think, if any, was with regard to stores in that year.

9239. As you have mentioned stores, I will come to that point particularly; although a very serious error was admitted with great candour by the Secretary of State for India, so much so that he altered a resolution, and that arose from the way in which the store accounts was made out, is it not the fact that at the present time a great part of the errors and discrepancies between the statement of the India Office and the statement of the Calcutta Government still arises from the same cause, namely, the way in which the store accounts are kept?—No, I am not aware of that.

9240. Are not the store accounts entered in different ways in the two books?—I think not.

9241. I have come to a very positive conclusion upon the point; can you say that you have looked into the matter, and investigated that point specially?—No, I have not.

9242. Perhaps as we may have an opportunity of examining you again, and I should like to ask you some questions on that point, you will kindly compare the two books?—I will; I may perhaps mention that a change has of late years been made in regard to the mode of charging stores, so as to avoid any possibility of difference in that respect, and the plan is now pursued, not as formerly, of the Government of India bringing to account as a charge of the year the stores which they receive, but we now charge, as the Committee will see in these Finance and Revenue Accounts, the amount which we pay in England during the year against its proper department.

9243. You will compare the way in which the store accounts are made up in the books furnished by the India Office, and in those furnished by the Calcutta Government?—I will.

9244. I suppose the Financial Department of the India Office exercises not simply a control over the finances of what you may call the Home Department, but over the general finances of India?—The Finance Department of the India Office has no power of control whatever; it is a department constituted in order to obtain information and to make suggestions to the Secretary of State in Council, and when he has passed his decision upon them, to carry the decision into effect.

9245. But the Secretary of State in Council has considerable, in fact primary, control over the finances of India, has he not?—He has.

9246. Then when the general accounts came back from Calcutta, if you detected anything

Mr.
Secombe,
C.B.

4 July 1871.

Mr.
Succombe,
C.B.
4 July 1871.

that you thought wrong, you would of course point it out to the Secretary of State for India?—Certainly.

9247. In 1868-69 did not it appear in the accounts furnished at Calcutta that there was a miscellaneous land receipt of a million?—There was a miscellaneous land receipt of a considerable amount, but not I think of a million.

9248. Could you refer to any of these books before me and tell me what the exact amount was?—I should be sorry to take as a matter of course a statement in either of those books and adopt it; I could furnish a statement.

9249. I believe I am correct in saying that there was a miscellaneous land receipt put down of a million, and I want to ask you whether that would not strike you as being so large a receipt that it demanded an investigation?—The land revenue in 1867-68 was 19,986,000*l.*; in 1868-69 it was 19,926,000 *l.*, very nearly the same amount as in the previous year; in the next year it was 21,088,000 *l.*, and I apprehend that is the year to which you refer. In that year the accounts included 124,536 *l.* sale proceeds of waste lands, 14,471 *l.* interest on Government securities purchased with proceeds of waste lands, and 282,066 *l.* value of Government securities purchased with proceeds of waste lands, amounting together to 427,073 *l.*

9250. That is the item to which I refer; did you point out to the Secretary of State that there was an enormous sale of waste lands; and that selling waste lands to this extent was really using up the property of the Government and spending it on income?—Yes. The Government of India in the letter which sent home the regular estimate for 1869-70, stated that the accumulated proceeds of waste lands had been credited to land revenue, and gave the reason for it; and in the Secretary of State's reply he adverted to the fact, but did not disapprove it, as he considered that the reason given by the Government of India was a sufficient reason.

9251. I am not going to enter into the policy of selling waste lands, because I consider our Committee is more a finance committee; but what I wish particularly to ask you about is, whether you think that it is a proper thing to sell a large amount of Government property like that, and to sell it for ever, and then put it down as income?—It is a question certainly upon which some doubt may reasonably be entertained, and I think that had it been apprehended that these sales of land would extend so as to alienate a very large portion of the Government property, it might be doubtful whether it would not be injudicious to include the proceeds as receipts of the year in which the sales were made; but taking the plan upon which the accounts are framed, of showing the gross receipts and gross expenditure, I certainly am of opinion that the Government of India gave a sufficient reason when they said that they thought that borrowing as we were, at 4 per cent. upon the faith of the remunerative character of the works on which we were going to expend the money, it was a cumbrous system that we should be retaining such an amount as half a million to be held in Government securities.

9252. But if you had appropriated this 500,000 *l.* to capital instead of income, what it really would have come to would have been this, that you would only have had to borrow less, and a Government should always try to borrow as

little as possible, I presume?—Pardon me, the view that you take is not a correct one; had it not been brought to account as revenue, we should have had to raise a larger sum, because our income would have been deficient to that extent.

9253. That is one way of looking at it, but another way is this; a Government habitually spends all the money that they can get at, and if they have less to spend there is a greater inducement for them to exercise economy; and it does not at all follow that if this 500,000 *l.* had been devoted to capital instead of to income, the Government would have spent as much as they did spend?—I cannot accept your view that the Government of India is actuated by so reckless a spirit. My own experience is that there is great care, and great pressure for economy exercised by the Home Government.

9254. That which I suggest is one way of looking at it, whether right or wrong?—It is undoubtedly.

9255. I will put to you another question that seems to me to involve most vital principles in Indian finance. Supposing that a man during the last 10 years has been spending more than his income; he is the owner of a landed estate, his estate brings him in 10,000 *l.* a year, he has been spending 12,000 *l.* a year, and, owing to his spending more than his income, he accumulates a debt of 20,000 *l.* in 10 years; suddenly he agrees to cut down an enormous quantity of timber, from which he realises a couple of thousand pounds. Would he not, if he were a prudent man, devote that money arising from the sale of his timber to the reduction of the mortgage on his estates rather than go and spend it?—Unquestionably.

9256. Does not that fairly represent the financial position of India?—No, I think not. This account is prepared upon the recognised principle which I have referred to of showing gross receipt and gross expenditure. I think when this balance sheet is before the Secretary of State, or before any individual, the first point it becomes important for him to ascertain is, are there any exceptional features in this year's account, and if there are he should take note of them, and in considering the future year's income or expenditure, he should be guided accordingly. That has always been done; these exceptional items have always been noted, and I have heard, even in Parliament, that we ought not to include the expenditure on barracks as a charge of the year; but we have done it upon the principle which we have adopted in regard to those receipts.

9257. I suppose, you will agree with me that it is not so much a matter of keeping accounts as it is a matter involving a very important financial principle, namely, the appropriation of money?—Certainly.

9258. And I am to understand you that any exceptional receipt, from whatever source, is always devoted to income, and never to reduction of debt?—If it be devoted to reduction of debt it should appear as a receipt of the year.

9259. *Chairman.*] I understand you to express this view, that all the receipts are put on one side of the account, and all the expenditure on the other; if there is a balance against the Government, and there is nothing to pay it, they will incur a debt; and if there is a surplus they will apply it in paying off debt, so that the incurring

incurring of debt on the one side, and the paying it off on the other is the result of the whole of the receipt and expenditure?—I would not go so far as to say that upon the transactions of the year they would either incur or pay off debt, but their balance would be diminished or otherwise.

9260. Having regard to the balance in the Treasury they would either borrow money or pay off debt, as the result of the whole of the transaction?—Yes.

9261. Therefore every transaction would be contributory, either to increase the debt, or to paying off the debt, according to the nature of the transaction; the Government does not incur or pay off debt on each particular item, but on the balance on the whole of the year?—Yes.

9262. Mr. *Fawcett*.] Putting it in another way, it comes to this, that extraordinary expenditure is paid for by borrowed money, and extraordinary receipts go towards income?—No, I have mentioned the expenditure on barracks, for instance, which comes out of ordinary income.

9263. All deficiencies have to be supplied by borrowed money, and all extraordinary receipts are put to income, are they not?—The principle laid down by the Secretary of State for India is, that extraordinary public works, which are likely to be remunerative, shall be constructed out of borrowed money, and that in regard to all other expenditure, it shall be so conducted that the charge shall be something within the income of the year.

9264. But taking the telegraphs of India, on which, I think, we annually lose 200,000*l.*, is that an extraordinary public work which is put down in that way?—At the time when that expenditure was incurred, there was no exception in regard to extraordinary public works.

9265. I mean the telegraph lately constructed; at the present moment that is involving a serious loss?—That is included in the ordinary expenditure.

9266. Take railways; for instance, when a railway was bought for 400,000*l.*, which does not pay its working expenses, I should presume that that is put down as extraordinary outlay?—No, I think it was not included in the extraordinary public works.

9267. Can you state positively how the fact is?—I cannot.

9268. Will you bring information on that point next time?—Yes.

9269. When you say that out of a great many of the extraordinary public works some may be remunerative, a great many have turned out certainly unremunerative, have they not?—No doubt.

9270. I suppose that the amount paid for Orissa irrigation works was a sum considered likely to be remunerative?—It was provided for by borrowed money, as being among extraordinary public works. I apprehend it will always be the case, that certain works will not pay directly.

9271. Therefore I am correct in saying, that what has actually happened is this, that you do borrow money to carry out public works, some of which are remunerative, and some of which are unremunerative?—No doubt of it.

9272. Referring to your railway receipt, I believe I am correct in saying that a certain

receipt is put down in these accounts arising from the Jubbulpore branch of the East India Railway, which did not pay its working expenses; how much capital was spent on that railway?—I have not before me any paper to show that.

9273. *Chairman*.] Who is the responsible executive officer in the Home Government for conducting their business in relation to railways in India?—There is a Government Director of Railways, Mr. Danvers, who submits a report annually to the Secretary of State; there is also a Railway Department.

9274. Who is the head of the Railway Department in the India Office?—Mr. Thornton.

9275. Mr. *Fawcett*.] Who is primarily responsible, not for simply conducting the railway business, but for recommending the Government either to purchase a particular railway, or to guarantee 5 per cent. upon the outlay?—I think there is no individual upon whom you could fix that responsibility.

9276. You say that there is no individual responsible; is there a committee responsible?—The Secretary of State in Council, I apprehend, is alone responsible.

9277. But in such a question who would be his advisers?—The officers whom I have named; that is, the Government Director of Railways, the Secretary in the Railway Department, and the Railway Committee.

9278. Who is the Secretary of the Railway Department?—Mr. Thornton.

9279. And the Committee is a Committee of the Indian Council, of course?—Yes.

9280. Mr. *B. Denison*.] A changeable and fluctuating committee?—Changing yearly.

9281. Mr. *Fawcett*.] How many does the committee consist of?—Five members.

9282. I am at a loss to understand how this railway receipt has arisen; will you explain it?—The Government having paid 5 per cent. upon the capital, according to their guarantee of the Jubbulpore line, that being a branch of the East Indian line, and there having been an excess of working expenses over the traffic receipts in that particular half year, the Government had to receive from the railway company that amount.

9283. But then the Government does not work the line, does it?—No.

9284. *Chairman*.] The Government receives all the receipts, and pays all the expenses through its Treasury?—Under the contract the receipts are paid into the Government Treasury.

9285. Under the contract they are entitled to any excess of working expenses over traffic receipts?—Clearly, otherwise their guarantee would not be limited to 5 per cent.

9286. Mr. *B. Denison*.] That payment has reference to the actual cash payment, not a matter of account?—Quite so. I find that that payment for the Calcutta and South Eastern Railway was carried to public works extraordinary.

9287. Mr. *Fawcett*.] What I understand this receipt really to be is this, it represents the excess of the working expenses of the railway over the receipts?—Over the traffic receipts in that half year.

9288. Was this a receipt or repayment during the present year?—It was received in the year 1869-70, and brought to account in that year.

Mr.
Saccombe,
C.B.

4 July 1871.

• Mr.
Sercombe,
C.B.
4 July 1871.

9289. Then the mere existence of this sum conclusively proves that the line does not pay its working expenses, does it not?—It did not in that half year.

9290. Mr. Dickinson.] Did you explain the first item of 44,000*l.* for Indo-European telegraph?—No, because Major Champaign attended at one of the last meetings of the committee to explain it.

9291. I see on both sides of the account an entry with respect to lunatics, about 8,000*l.* paid and 400*l.* received; what class of lunatics are those?—They are military officers and soldiers of Government who have become insane, and who are provided for by the Government.

9292. Is the Government liable to pay the expenses of those persons?—Yes.

9293. With respect to the item of repayment for clothing, is all the clothing of the troops in India provided by the Home Government?—All the clothing of the European troops is.

9294. And when a regiment goes there is the regiment charged with the value of the clothes it wears when it gets there?—From the moment that a regiment is placed on the India establishment, we pay the value of the clothing on their backs.

9295. And you receive the value of the clothing on the backs when they leave?—Quite so.

9296. Then the India authorities have nothing to do with the nature of the clothing, the materials, and so on?—It is obtained by us from the Imperial Clothing Department at Pinllico.

9297. If sometimes it has occurred that a regiment has arrived there in clothing too hot for the climate, and does not find its Indian clothing, whose fault is that?—I am unable to say who could be held responsible for any instances that may have occurred. If hereafter serge clothing is not ready on the arrival of a regiment in India, the responsibility will rest with the Government of India.

9298. Does the regiment leave this country with the clothes prepared in depot before it leaves?—Yes.

9299. And arrives in India with clothing unfitted for the climate?—I do not say unfitted for the climate; it arrives in India with that clothing with which it starts.

9300. With clothing fitted for this climate?—Yes.

9301. Sir D. Wedderburn.] Can you tell me how the expenses in connection with the observations of the solar eclipse in 1868 were apportioned between the Home and the Indian Treasury?—In equal portions, I think.

9302. The whole expenditure?—The whole expenditure.

9303. It says here: "Moiety of the expense incurred in England in connection with the observations?"—I am not quite sure; but I think I am right in saying that a moiety of the expense in India also was borne by the Imperial Government.

9304. A moiety of the whole expense incurred, both in England and in India?—Yes.

9305. Mr. Dickinson.] Did I rightly understand you that the cable first laid down for the British Government to Malta was taken round to Rangoon?—It was constructed originally for a line from Falmouth to Gibraltar, but being too

heavy, it was agreed that it should be laid down at the joint expense of the Imperial and Indian Governments, between Rangoon and Singapore; it was shipped, but a portion of it in one ship became heated, and the cable had to be landed, and never reached Rangoon.

9306. Is there a cable now between Rangoon and Singapore?—I believe not, but am unable to answer confidently. It does not relate to my department.

9307. For all the expense connected with that the Indian Government have got nothing to show?—Certainly not for this cable.

9308. And eventually it was laid between Malta and Alexandria, at the expense of two-fifths to the Indian Government and three-fifths to the English Government?—Yes.

9309. Sir S. Northcote.] Do you think upon the whole that the system on which the accounts of receipts and disbursements are kept is a correct system; that is to say, carrying all receipts to one side, without attempting to distinguish between what is a receipt from capital, and what is a receipt in the nature of revenue?—Yes, I think it is the best way of keeping the accounts; but I think it is desirable that the accounts should be supplemented by information as to exceptional items, so that they may not mislead anyone not familiar with those accounts.

9310. If you attempted to keep distinct accounts upon the principle of separating what was capital from what was revenue, would there not frequently be confusion and opportunities for, to a certain extent, doctoring the accounts, so as to make them appear a little more favourable or a little less favourable?—I think that is almost inevitable.

9311. And therefore it is more convenient, and tends more to accuracy of information, that there should be one account at all events which shows the whole of the receipts on one side, leaving it afterwards to be distinguished by those who have the duty; which of them should be treated on the one principle, and which on the other?—I think so.

9312. Perhaps, as so much has been said about responsibility, it may be as well to try and clear that up. The ultimate responsibility for expenditure incurred by the India Office rests upon the Secretary of State in Council, does it not?—Certainly.

9313. The Secretary of State in Council has, however, recourse to advice, partly from a committee of the Council, and partly from executive officers?—Yes.

9314. Is it not sometimes the case that in special works involving engineering work or other peculiar kinds of work, he takes advice from persons outside the office?—It is so.

9315. When he does so that fact of course would be known to the executive officers, and to the committee of Council?—Quite so.

9316. And he would make use of the information so obtained in bringing the matter before them?—Yes.

9317. But that does not relieve him of the ultimate responsibility of the decision?—Certainly not.

9318. Mr. J. B. Smith.] You were asked about the Orissa works which were put in your accounts as a reproductive work, and have as yet produced nothing; is that the case?—It was placed among expenditure on public works extraordinary,

ordinary, irrigation works being so regarded in the orders of the Secretary of State in Council.

9319. As those works are not completed it is not fair to judge whether they will be reproductive or not, is it?—No.

9320. Mr. *Lyttelton*.] Under what heading in the accounts do we find the proceeds of the sale of the telegraph, the two-fifths?—There is only the sum of 10,091*l.* in 1869-70 on account of rent; in former years other sums have been brought to account.

9321. That is a proportion of rent?—Yes; the purchase money is about to be paid; it will come into the account of 1871-2.

9322. Mr. *Candlish*.] In the account before me there is a sum of 17,000*l.* as the value of clothing transferred from the Indian to the British establishment?—Yes.

9323. That is the clothing of soldiers from India?—Yes.

9324. How is that realised; what do you do with it?—For the clothing which remains with the regiment we are credited by the War Office with the value. So far as relates to any articles sold they are disposed of by our Store Department and the amount brought to account.

9325. As a rule, the clothing coming from India will not be available for use here, will it?—It rests with the Imperial Government to determine.

9326. You say there is no capital account in India; you merely mean by that, I presume, that it does not enter into the annual balance sheet; there will be an account of capital belonging to the Indian Government in India, will there not?—I believe that that account is no longer kept. There used to be an account termed "Dead and Quick Stock," and I think it was given in evidence by Mr. Harrison, the Comptroller General of Accounts, who is more competent to speak on that point than I am, that that account has been discontinued.

9327. Where you have railways and telegraphs and land in India, have you no account of those?—No.

9328. Neither here nor in India?—If I understand your question rightly, it is, Have we anything like an account of capitalised value, and to that I answer, No.

9329. What account have you; have you some account?—Of course there are, in regard to lands, records which show the assessment.

9330. Would not such an account as I have been indicating be a very useful account?—It was not found to be so.

9331. Then you have no record of the value of your property in India?—I think that I am right in saying that there is not any record of the value of our buildings.

9332. Neither here nor in India?—No.

9333. I mean railways and telegraphs also, besides buildings?—I think none.

9334. *Chairman*.] Will you be good enough to turn to the beginning of the Account, at page 2, to the heading, "Debt Incurred.—India 4 per Cent. Stock.—Sale proceeds, 4,039,412*l.* 10*s.*;" before that there is an item of "Balance on the 1st April 1869, 3,025,981*l.* 11*s.* 2*d.*;" what does that represent?—It represents the balance in the Home Treasury on that day, including any loans made from the cash balance which were outstanding at the moment.

9335. That includes not merely the cash, but all the money available at the disposal of the 0.59.

Secretary of State for India in Council at that date, whether out on loan or obtainable on demand?—Yes.

9336. Mr. *B. Denison*.] Is the balance a fluctuating amount, or is it pretty evenly what it appears here, 3,000,000*l.*, because I have gone through the accounts of several years past and I have taken the trouble to excerpt a statement, and I find that for the last few years the balance does come out pretty much the same sum, 3,000,000*l.* Is the balance kept up nominally at the minimum sum of 3,000,000*l.*?—We consider that about 3,000,000*l.* is the amount which at the commencement of the year the Secretary of State should have in his treasury.

9337. Have you a special arrangement with the Bank of England or with your bankers as to the minimum balance that should be retained?—There is an understanding that our minimum balance should be half a million.

9338. And practically it is from two to three millions at all times?—At the time that it appears here as 3,000,000*l.*, it is probable that one-half, in fact as much as we could lend advantageously at the moment, was out on loan.

9339. Referring back for the last seven or eight years to the amount of balances, going back as far as 1863, the balance was then upwards of 5,000,000*l.*; in 1864, 4,500,000*l.*; in 1865, 4,000,000*l.*; in 1866 close upon 3,000,000*l.*; in 1867 upwards of 4,000,000*l.*; and in the later years it has been about 3,000,000*l.*; and in those former years the amount of interest on the floating balance used to be very much larger than anything it is at the present time; it has been as high as 125,000*l.* for two years in succession, then 79,000*l.*, then 38,000*l.*, then 27,000*l.*; I want to know what is the arrangement that you now have with the bank regarding the investment of the floating balances?—The bank has nothing to do with our investment of the balance; that is lent by ourselves upon Government securities; with regard to what the bank has to do, our arrangement with the bank is, as I said before, that we shall maintain a minimum balance of 500,000*l.*

9340. When the sum exceeds that, are special orders given regarding the investment, or has that to be done through the broker at the India Office?—Yes, through the broker.

9341. The amount of interest which is yearly drawn upon those investments, is a matter of separate account, and has nothing to do with the banking account?—Nothing whatever; it is brought to credit in this way.

9342. There is one other question connected with the balance; when you have received into the India Office a sum of money on the sale of your bills, those bills are very often retained for long periods of time in the hands of money speculators in the City of London and elsewhere. Is there at the moment, or immediately after, any corresponding communication made to the Government in India directing them to debit themselves with the amount which you have obtained in London?—The Government is advised beforehand of the probable drawings in each month, and immediately the bills are drawn the advices are sent to them by the succeeding mail.

9343. I will put it in another way; taking the Finance Minister's exposition of the Accounts of 1869-70, I find the balance in England, 3,026,000*l.*, in India, 10,175,000*l.*; it might be

Mr.
Seccombe.
C.D.
July 1871.

Mr.
Secombe,
C.B.
4 July 1871.

be possible under the present system that that 10,000,000 *l.* which appears as a cash balance in India, on that date, the 31st of March, is debitable with either 1,000,000 *l.* or 2,000,000 *l.* of money which has already been paid into the Treasury in London?—Certainly it might be if the bills were not presented.

9344. Then would not that derange the actual disposable balance at the disposition of the Government of India?—I think not, because the Government of India would know that they must regard that 2,000,000 *l.* as unavailable for any purpose, and as what may be demanded at any moment, as the bills are payable on demand.

9345. Then you see no advantage in so exhibiting the accounts as to show the amount of these bills, which may be said to be in transit after they have been sold in London and have not been debited in India?—I do not see in what accounts it could be done usefully. The Government of India is the only authority concerned, and they are fully informed of what they have to meet.

9346. Mr. *Cave*.] There is no interest received on this balance, or any part of it at the bank. I suppose?—No interest. I ought to state, that the bank renders us great facilities in our transactions, for which they charge us nothing; there are certain other portions of our business for which we pay the same as the Imperial Government.

9347. Mr. *Candlish*.] If you have 3,000,000 *l.* of cash balance who determines that you may invest a million of it?—The chairman of the finance committee, in communication with myself and the Accountant General and the broker.

9348. Have you any rule by which you determine what balance shall be in the bank?—No, we have no rule; we consider that our balance should be increased if we find our payments are becoming heavier.

9349. *Chairman*.] It is usual for you to have a balance of 3,000,000 *l.* at the beginning of the year; has that reference to any particular class of payments to be made just then?—Generally, with reference to the magnitude of our transactions, we consider that our Treasury should never be lower than about 2,000,000 *l.*, but the beginning of the official year is not a period of heavy payments; our heaviest payments come in July and January, and therefore we increase from 3,000,000 *l.* in April up to the larger amount by July.

9350. Mr. *J. B. Smith*.] Do the bank charge you any interest when the balance is below 500,000 *l.*?—There have been instances in which, when our balance has been low, we have requested the bank to make us a loan of half a million or a million at a certain rate, and that has been done.

9351. But you say that you always have 500,000 *l.* in the hands of the bank?—That is the understanding.

9352. Is that a part of the compensation which the bank receives for doing your business?—I presume it must be so regarded.

9353. Do they not, besides that, make you a charge for doing their business?—For doing certain portions of our business they do; that is, for the management of our debt; but that is distinctly provided for in the same way as the

management of the debt of the Imperial Government, and at the same rate, 340 *l.* per million.

9354. Then the sole profit that the bank gets upon your account is the deposit of this 500,000 *l.* free of interest, and they transact your business for that sum?—They do.

9355. I see a sum of 13,600 *l.* paid to the bank; is that for the management of the debt?—Yes.

9356. Mr. *Crawford*.] Are you not going very largely to avail yourselves of the services of the bank in paying the dividends in another manner, namely, to send them through the post, and distribute them to the public?—Yes; and our bills are drawn by the officers of the bank without any charge to us.

9357. Mr. *Candlish*.] What will be your average balance at the bank; can you give me an approximate figure?—I am unable to state it.

9358. Would it be a couple of millions?—No, not so much as that; at the present moment, I think, our balance at the bank is about a million and a half, but we have heavy payments immediately before us, which will reduce it greatly.

9359. Will the average be a million?—I should think not of cash.

9360. If it were a million at 2 *l.* per cent., that would be 20,000 *l.* a year?—Yes.

9361. You reckon it at 2 *l.* per cent. with the bank, do not you?—Their discount rate is at the present moment 2 *l.*

9362. Mr. *Crawford*.] Have you any means of forming an opinion on that point?—No.

9363. Mr. *Fawcett*.] We understand that these are the terms on which you carry on your business with the bank: you are bound to keep a deposit of 500,000 *l.*; however large your balance is beyond that (and sometimes it amounts to two millions), you do not get a shilling of interest, and if ever it sinks below 500,000 *l.* you have to pay interest?—No, that rule is not rigidly observed by the bank; it is an understanding, but we have been occasionally below 500,000 *l.*, and have had no charge made.

9364. However, it is an understanding, that however greatly your balance exceeds 500,000 *l.*, you do not get any interest?—We do not.

9365. And it is an understanding, that if it falls below 500,000 *l.* you have to pay interest?—If it were likely to be below 500,000 *l.* for a considerable period, our course would be to ask the bank to lend us half a million for a certain time.

9366. Mr. *Crawford*.] Have you ever had an application made to you by the bank, for interest due to them, when your account has been below 500,000 *l.*?—No.

9367. Mr. *Fawcett*.] But when it gets below 500,000 *l.*, do not you, as a general rule, apply to the bank for a loan?—It is very rarely that it is below 500,000 *l.* Of late years we have not had occasion to obtain a loan from them.

9368. Mr. *Beach*.] If you were likely to need a considerable sum, you would ask for a loan?—Yes; if to day we saw there was a probability of our balance falling to 200,000 *l.*, or 300,000 *l.*, for any length of time, we should ask the bank to lend us 500,000 *l.* for a limited term.

9369. Mr. *Fawcett*.] But suppose your balance was likely to be 1,500,000 *l.* for three months, you would not get any interest for the extra million?—We should hope to do so by lending it.

9370. Sometimes,

9370. Sometimes, however, you have it in the bank?—Only when we cannot lend it.

9371. *Chairman.*] You do not hold yourselves obliged to keep the cash there, if it exceeds 500,000 *l.*?—We do not.

9372. *Mr. Fawcett.*] Are weekly statements similar to those published by the British Government, published by you as to the deposit account with the Bank of England?—No, not any.

9373. Do you think there is any objection to that?—I think it might possibly affect the terms on which we borrow, and therefore it is not to be desired in the interests of India.

9374. But would it affect the terms on which you borrow, more than it affects the terms on which the English Government negotiates their Exchequer Bills?—I am unable to say how far it affects them. No doubt we should be reluctant to do it, if we could avoid it.

9375. *Mr. Cross.*] What is the amount of your turn-over in the course of a year?—All our disbursements go through the Bank; they vary from 13,000,000 *l.* to 17,500,000 *l.*

9376. For which the Bank charge you nothing?—They charge us nothing, and they give us great facilities for the transaction of our business.

9377. Do they make payments for you in India?—No; only in this country.

9378. But they do afford you very great facilities?—Great facilities.

9379. Perhaps you can explain to the Committee the general nature of the facilities which they do afford you in that way?—The Governor and Deputy Governor of the Bank, twice every month, allow us to receive at the Bank the tenders for bills, which are opened in their presence, which fact becomes known, and no doubt tends to give confidence to the public, who make those tenders. Their officers draw those bills, and they charge us only for the stamps; they pay the coupons on our bonds and debentures, without any charge; and in all questions of difficulty as to rates of exchange, or borrowing, we have the great advantage of the opinion of the Governor and Deputy Governor of the Bank at the time.

9380. In fact they give you every possible assistance in their power?—They do.

9381. *Chairman.*] Do you keep your accounts in any special form with the Bank?—No.

9382. Have you one general cash account?—We have three accounts; a cash account, a drawing account, and a bill account, and when necessary a bond and debenture account.

9383. And are all the payments in detail drawn upon the Bank?—Yes, our cheques are drawn at the India Office and cashed at the bank.

9384. Is every small payment made by cheque upon the Bank of England?—All, but small amounts.

9385. *Mr. Cross.*] Down to what amount are the payments made through the Bank?—There is no minimum fixed; as a practice we do not draw cheques below 20 *l.*

9386. *Chairman.*] The money is always disbursed directly from the Bank of England?—Yes, for cheques.

9387. *Mr. Cave.*] Can you draw upon your balance without notice?—Yes; communications are made every day to the Bank, as to the amount that will be drawn.

0.59.

9388. You give no more notice than that?—No.

9389. *Mr. B. Denison.*] In order to keep up this nominal balance of three millions, you do, as a matter of fact, sell bills in every month of the year?—Yes, unless the Government of India should apprise us that they are unable to meet the bills, from any circumstances, for a time; and unless the rate of exchange should become so unfavourable that a bullion remittance would pay us better.

9390. But the rate of exchange being now something like 7 per cent., or 1 *l.* for every farthing to the rupee, is it not a very costly way of keeping up this balance, that you are drawing on India at all seasons without reference to the rate of exchange?—It is considered to be the best and most favourable mode in which we can obtain our remittances. The Court of Directors of the East India Company adopted other modes; one by making advances upon goods, another by keeping their treasury open at all times for the receipt of money for bills; but they found that that did not answer, and we regard the new system that we have introduced as a very successful and satisfactory one.

9391. *Mr. Crawford.*] The new system gives great satisfaction to the public, does it not?—Yes.

9392. Any person desiring to remit money to India, if the amount exceeds 5,000 rupees, can tender by himself or his agent for a bill to that amount?—Yes, the minimum bill is 5,000 rupees, but the tender must be for 10,000 rupees.

9393. *Mr. Fawcett.*] We are to understand when you said that it gave great satisfaction to the public, that you meant the mercantile community of London, and not the Indian people, I presume?—I have never heard of any dissatisfaction caused to the people of India.

9394. *Mr. Crawford.*] Is not the satisfaction given to the public a very great assistance to the Government in obtaining their supplies of cash here?—We have always so regarded it.

9395. *Chairman.*] You see an item in the account of "bills" of exchange on India, 6,980,121 *l.* 11 *s.* 8 *d.*; is that the amount that was necessary to be drawn in the year to supply the funds for the expenditure in England?—It was.

9396. How is that amount generally ascertained by the Government of India?—About Christmas in every year, the Secretary of State sends an estimate to the Government of India of the home expenditure in the year beginning on the 1st April following; that estimate contains any probable receipts from the Imperial Government; and it shows what sum must be provided to maintain the cash balance that is considered necessary. The Secretary of State then informs the Government of India what sum will be borrowed in England, and how much will be obtained for bills on India.

9397. Supposing there be a deficit in the expenditure for the whole year, it is then necessary to consider whether the sum shall be met partly by bill, and partly by loan, or entirely by bills?—Quite so; and the estimate is sent out about Christmas, in order that before the budget statement is made, and the financial questions involved in that statement are considered by the Government of India, they may see what transactions in England have to be provided for.

9398. Then there is some established system

3 K 2

on

Mr.
Seccombe,
C.B.
4 July 1871.

Mr. Secombe, C.B.
4 July 1871, on which the bills are drawn in this country; are there any public rules?—An advertisement is published every fortnight of the amount that will be drawn, and tenders are invited, and received at the Bank of England.

9399. Are you aware whether there was much discussion some few years ago, respecting the various methods of placing the Government of England in funds, and that it was finally determined that drawing bills was the best method?—It is a question that is always pressing anxiously upon the attention of the Secretary of State in Council; some few years ago, the rate of exchange fell so low, that we had to write to the Government of India, telling them to prepare themselves for making advances upon goods, a plan which in ordinary times is not thought to be a good one.

9400. Formerly, they were in the habit of using that mode?—They advanced on goods, but it proved to be very unsatisfactory; and for a time after the termination of the East India Company's Commercial Charter, they had to maintain a special and expensive establishment, in China, in order to remit from thence half-a-million a year.

9401. Was it on full consideration of the difficulties of that mode of proceedings that they determined to give up the practice of remitting and to confine themselves exclusively to the practice of drawing?—It was.

9402. Has that question been reconsidered in late years as to the general practice of remitting instead of drawing?—Yes; when the exchange fell about five years ago very low, as I mentioned before, the Secretary of State sent a dispatch with rules for making advances to the Government of India, but, fortunately for us, the exchange became favourable, and we were able to obtain our bills as before.

9403. It is still the practice, unless the particular circumstances of the exchange render the contrary necessary, for you to limit yourselves to drawing bills?—Yes.

9404. And are these bills drawn at regular intervals throughout the year?—Twice a month; on the first and third Wednesday in each month the tenders are received.

9405. Are these bills drawn in this way, upon the principle that the Government ought not to speculate at all upon the exchanges, but to have some regular system, so as not to interfere with the ordinary operations of commerce?—Yes.

9406. In order that the mercantile community and the public, generally, may carry on their affairs with a knowledge of the operations of the Government?—Yes.

9407. Do you know whether any examination has been made to find out whether this or the whole has turned out to be the most satisfactory mode of having funds placed in this country?—I am hardly aware what examination could be made of the matter; we occasionally consider the whole question in all its bearings.

9408. Have you had to make any bullion remittances lately, in consequence of a special rate of exchange?—Yes, we have in consequence of the exchange falling.

9409. Whenever the exchange reaches that point, the subject is considered of a remittance to adjust the exchanges?—Yes.

9410. Mr. Fawcett.] I understand from you that at Christmas, the Home Government send out to Calcutta an estimate of what they will

require for the financial year ending the first of April following; therefore, what they really send out to India is the actual expenditure for three quarters of a year, and the estimated expenditure for the remaining quarter?—No, it is entirely prospective, it is for the year beginning on the 1st April following, and terminating on the 31st of March in the next year.

9411. Therefore, the whole of this estimate is entirely prospective?—It is.

9412. That I suppose is one great cause of the uncertainty in the financial statements of the Indian minister, is it not, that, taking what you sent out as an estimate, often the actual expenditure turns out to be a great deal more or a great deal less?—Like all estimates, it is subject to fluctuation in the result.

9413. But why is it absolutely necessary, considering that we have the telegraph and can communicate with India directly, that you should send out estimates so long before the time?—For the reason that I gave just now, that the Indian minister requires that information in order to ascertain what he has to provide for in the coming year; in making his budget statement in the month of March, it is absolutely necessary that he should have that information.

9414. But what I mean is this; supposing there is anything that affects the expenditure or the revenue up to the very day before he introduces his budget, he can calculate that; but you send your estimate out three months before, and that of course introduces a great additional element of uncertainty?—If there were any probability of an important deviation from it, we should apprise him of it immediately.

9415. Has that often been done?—It is rarely found to be necessary.

9416. But as a matter of fact, have our estimates usually been correct?—As correct as estimates generally are.

9417. As correct as the English estimates?—Quite so. Lord Mayo recently called attention to them in the Legislative Council in Calcutta. He showed that although the Indian estimates had been so much condemned, they bore a very favourable comparison with the estimates of the Chancellor of the Exchequer, in the House of Commons.

9418. Mr. Grant Duff.] I believe you have prepared a Statement in regard to that; perhaps you will put it in for the information of the Committee?—Yes.—(Vide Appendix.)

9419. Mr. Fawcett.] To bring it out in evidence, could you mention any general facts that may be deduced from it?—No, I am not aware that there is anything to be deduced from it other than this, that however carefully an estimate may be prepared, events may defeat the calculation of the person who made it.

9420. Mr. B. Denison.] It is not so very difficult to form an estimate within a margin of 3,000,000 *l.* of money, which is the balance that you start with?—We should consider our estimates exceedingly defective, if they were not very much within one million.

9421. You always have that balance of two to three millions as a margin?—I am afraid that I have not made it very clear of what nature our estimate is. We give, under every general head of expenditure, the amount which will have to be incurred, and the deviation from that estimate, unless it be under some exceptional circumstances, is usually slight.

9422. Mr.

9422. Mr. *Fussett*.] But that return, in order to be complete, ought also to contain what is the variation in your cash balances at the bank?—Our cash balance at the bank, of course, is varying continually, from the magnitude of our transactions, and also from the uncertainty of some of those connected with railways.

9423. Supposing that your expenditure exceeds your estimate by a million, is there anything in your return to show that you have provided for that extra expenditure, out of cash balances?—It follows that we must have done so.

9424. But you having done so, would the return show that the expenditure had really exceeded the estimate by a million?—We present to Parliament the estimate and the account; the difference between the two is explained in these Papers which are before you, in which all the Home Accounts appear.

9425. But I mean would the Papers laid before Parliament show, in order to correct the error in the estimate compared with the actual expenditure, how much it had been necessary for you to draw from your cash balances?—It would only be seen on a comparison of the cash balance, as shown in the estimate and the account.

9426. From the Papers one could deduce that for himself without coming to you, or to the India Office, and asking for any additional information?—Yes, from these Papers.

9427. Mr. *Cave*.] Your cash balance and your estimates have nothing to do with each other?—Nothing.

9428. It is only an accident that the cash balance is called upon to rectify an error in the estimates?—Yes.

9429. Mr. *B. Denison*.] This system of drawing bills on India must be now of a good many years' date, is it not?—Yes.

9430. It originated, did it not, prior to the time in which there was direct telegraphic communication with India?—Not the present system. The system of the Court of Directors in the period to which you refer was that of keeping their treasury open at all times, and they merely advertised from time to time a raising or lowering of the rate of exchange; that was found to be attended with great inconvenience. Our present system dates from the year 1862, when tenders were first invited.

9431. Supposing that you desired to alter the present system, apart from the gentlemen whom you have named as being the regular advisers in these matters, should you think it necessary to take counsel of great bodies like the Bank of England or other financial persons in the City of London?—As a rule, I think I may say that in all those matters the Secretary of State consults the Governor and Deputy Governor of the Bank of England.

9432. Have you had under consideration at any time since telegraphic communication has been established, the advantage of from time to time directing the Governments in Calcutta and Bombay to buy bills upon London through the medium of the bank?—We know that they are fully alive to that necessity or to the desirability of doing so, if it could be done on more advantageous terms than those on which we draw.

9433. You are not of opinion that the present rate of exchange is abnormal; and I not correct in saying that it is about 7 per cent.?—We are drawing our bills now at 1 s. 10½ d.

0.68.

9434. You are decidedly of opinion that you could not change the present system with pecuniary advantage to the finances of India?—That is our opinion, and it is an opinion formed after much anxious consideration, because we know that there is a risk at any time of our being cut off from this mode of remittance.

9435. Have you within the last four or five years had remittances of bullion?—Yes, in 1866 and 1870.

9436. *Chairman*.] Will you direct your attention, if you please, to the item of "India 4 per Cent Stock, Sale Proceeds," 4,039,412 l. 10 s., and state to what that item refers?—That is the amount which we found it desirable to borrow in this country, in consequence of the Government of India, during the year, having requested us to cease drawing, or to draw for a less amount than that which we had originally required them to provide for. The sales of stock were consequently increased, and we were thus enabled to relieve the Government of India from a pressure which they would have found inconvenient.

9437. Then, by "Sales of Stock," you mean that you raised a loan for that amount?—Yes; we increased our debt to that extent.

9438. Was it all in one stock?—All 4 per Cent. Stock.

9439. What do you call the stock?—It is India 4 per Cent. Stock, raised under the authority of different Acts of Parliament; it is recorded at the Bank of England, and dealt with in precisely the same way as the Consolidated or Reduced Annuities.

9440. Mr. *B. Denison*.] Is the interest payable in either country?—Only in London.

9441. Mr. *Cave*.] Is it issued at par?—It is issued at par or above par.

9442. Mr. *Crawford*.] I think your powers were a year or two ago exhausted, and application was made to Parliament to grant the Secretary of State power to borrow a sum of 8,000,000 l.?—Yes.

9443. But it was an understanding that part of that money was to be applied to the construction of the Government railways in India?—Yes; and extraordinary public works generally.

9444. Will you describe the practice which you follow in taking that money up in the market; you first instruct, I think, the Governor of the Bank of England to create stock for a certain amount?—Yes.

9445. That is to say, to raise stock in their books?—Yes.

9446. What do you do after that?—Then, the stock being raised, it is sold as favourable opportunities offer by our broker, we taking care not to sell so rapidly as to depreciate the value of the stock, and by that means we obtain a favourable loan.

9447. And how often does that operation occur?—It is almost continuous.

9448. From month to month?—From month to month.

9449. £. 200,000 or 300,000 l. a month?—Sometimes 200,000 l.; if we see that the market is rising, we instruct our broker not to sell until he gets a more favourable rate.

9450. And you generally get one price; that is, you get par?—We are selling above par.

9451. What are you getting at this moment?—We are getting at this moment 101½; that is, about 1 per cent. being absorbed by the interest of it, we have a premium of about a half per cent.

9452. The

Mr.
Secombe,
C.B.

4 July 1871.

Mr.
Secombe,
 C.B.
 4 July 1871.

9452. The transaction is, so to say, as far as regards the market generally, entirely a private one between the office, the broker, and the buyer?—Yes.

9453. It is not offered in the market in large amounts?—It is not.

9454. You think that it would be prejudicial to the price that would be obtained if the Government came into the market less frequently and with larger sums?—We do think so certainly, and experience has proved it. In the year 1859–60, in which we were dealing only with 5 per Cent. Stock, on the 23rd of August we issued on tender stock at the rate of 97, and under the system I have just been referring to, we obtained 102*l.* 10*s.*

9455. Did you obtain 102*l.* 10*s.* in 1859?—Yes, for 5 per cent; again in 1860–61, we obtained 104*l.*, within a fraction, and for that issued on tender we only got 98*l.* 14*s.*

9456. For the same stock at the same time?—Yes, and I have particulars for other periods showing the operation of the two methods, with a similar result.

9457. How much of the last Parliamentary authorised stock of 8,000,000*l.* remains still to be sold?—In round numbers about 4,000,000*l.*, I think.

9458. Mr. *Fawcett*.] May I ask you if you can explain how it is that you can sell this 4 per Cent. Loan at 101½; is it because it is a Parliamentary loan that you can sell it at 101½, while 5 per Cent. Stock stands, at the present moment, at about 109?—I can only explain it so far that it is, I think, justly regarded by the public as a very good security, and it has the advantage of being dealt in at all times, and recorded in the books of the Bank of England in the same way as the Government Stocks.

9459. But I am afraid that the public are deluded; is not the security exactly the same in every respect as the security of the Indian 5 per Cent.?—The security is the same in regard to the 4 as to the 5 per Cent. Stock, but the latter may be paid off in 1880. In the case of the Indian 5 per Cent. Rupee Paper, you can only obtain your interest in India; you have all the difficulties of exchange.

9460. But allowing for that, the Indian 5 per Cent. Loan returns a considerably larger interest than these 4 per Cents.?—The India 5 per Cent. Stock returns a larger interest, but the Stock may be paid off at par in 1880.

9461. Mr. *Crawford*.] Is not the price of the India Rupee Loans very much governed by the periods in which they come in course of payment?—Yes.

9462. You have a large loan coming in course of payment very shortly, I believe?—Yes.

9463. When?—In January 1872, we have the

option of paying off in India the 5 per Cent. Loan of 1856–7.

9464. Of course the option of a 5 per Cent. Loan in stock which comes in course of payment in a few months must be very different from that which has 15 years to run?—Undoubtedly.

9465. As to these loans that you are now making in London under Parliamentary sanction, at what periods are they redeemable?—The 4 per Cent. Loan in 1888; not before.

9466. Mr. *Fawcett*.] You do not think, do you, as to this particular loan which was raised by the authority of Parliament, that the fact of Parliament giving its sanction to the loan, imposes upon the English people any greater obligation to pay the interest on it, supposing India could not pay it, than it does to pay the interest on the rest of the money which India borrows?—That is a question which I think I can hardly answer; it certainly is not legally imposed upon them.

9467. I once heard a very eminent official at the India House say, that he thought England was morally bound to pay; and what I am afraid of is, that while this loan stands at high prices, from the fact of Parliament giving a sanction to it, the public believe in our moral obligation to pay the interest of it?—I think that Indian official to whom you refer could hardly have been in the Financial Department.

9468. Perhaps you would rather not give an opinion upon the point, but I think it is a very important thing to get at, because a great deal of trust money is invested in that; you do not think that the mere fact of Parliament allowing this loan to be raised imposes any moral obligation upon the English people to pay it?—No, I think not; but it imposes a certain amount of responsibility on Parliament, I apprehend, to see that India is so governed that the creditors shall have good security.

9469. Mr. *Crawford*.] The authority granted by Parliament to the India Office to borrow money in this country is no more than the authority granted by Parliament to a railway company to borrow money, is it?—No.

9470. Mr. *B. Denison*.] The courts of law are now permitted by statute to invest money in Indian loans, are they not?—They are; there is a special Act for that purpose.

9471. Would there be any objection to lay before the Committee a tabulated statement, showing for a given number of years, say, the last 10 years, the amount of money that has been drawn upon India, and the rate at which it has been drawn?—None whatever.—(Vide *Appendix*.)

9472. Mr. *Fawcett*.] Should you have any objection to lay before us the weekly amount of the cash balances at the Bank of England for the last year?—Certainly not.—(Vide *Appendix*.)

Friday, 7th July 1871.

Sir Charles Wingfield.

THE RIGHT HONOURABLE ACTON SMEE AYRTON, IN THE CHAIR

Mr. JAMES GEDDES, called in; and Examined.

9473. *Chairman.*] WHAT has been your occupation in connection with India?—I have been in the Bengal Civil Service since 1861, and I have resided in India since 1861.

9474. Are you still in the service?—Yes.

9475. And you are at home on leave?—On furlough.

9476. Mr. *Fawcett.*] I believe that you were sent down to Orissa to administer relief in the famine there, were you not, in your official capacity?—Yes. I was sent with special powers, as collector and magistrate in the three districts of Orissa.

9477. You obtained your appointment, did you not, through open competitive examination, in which you occupied the first place in the final examination?—Yes.

9478. Have you anything to tell the Committee about the famine in Orissa, and its causes?—Among the different antecedents, variable and invariable, which led to the famine, the chief antecedent which could have been varied has never, I think, been sufficiently adverted to, and that antecedent was the weight of the Government taxation.

9479. I suppose, when you say that the famine was caused by the weight of Government taxation, you mean that the province of Orissa was depleted of produce, which was exported to pay the Government taxes?—It was so. The food reserve of Orissa was unduly depleted in 1865, and had been normally depleted unduly in each of many previous years. When a short monsoon came it resulted in very severe famine.

9480. The idea that you wish to convey is, that considering that there are, at periodic intervals, unfavourable seasons in India, it is customary to keep stores of food, and these stores of food were exhausted in order to pay the taxes?—That the food reserve of one year, the proceeds of the crops of one year being sold off to pay the taxes, insufficient was left for the following year in which the rains might fall short.

9481. Then, according to your ideas, increasing

exports are by no means a conclusive test of the prosperity of India, but rather the reverse?—Often the reverse of prosperity, because the exports are very largely compulsory.

9482. That, in fact, the more taxation increases the more exports would increase, in order to pay the taxes?—Yes. Of course the exports would increase otherwise, and I do not attribute the whole of the increase of exportation to the increase of taxation, but I do attribute a large portion of it to that cause, and I demur, therefore, to the inference usually drawn from increasing exports and increasing imports.

9483. But we have been informed that the famine was due to a want of irrigation in Orissa, and that that want will be likely to be supplied by the carrying out of certain works, which are known as the Orissa Irrigation Works. Do you agree with that opinion?—Yes, the country would be much benefited by the irrigation works provided, that is, that the cost of the irrigation works be not defrayed by Orissa.

9484. But are these irrigation works likely to prove remunerative, or are they likely to throw additional taxation on the country?—Additional taxation over India, do you mean.

9485. Yes?—Whether on Orissa or not specially, yet certainly on India, and with India, of course on Orissa.

9486. But then do you think that they are permanently likely to prove unremunerative, or do you incline to the opinion previously expressed, that they have been carried out so incompletely that you cannot tell yet whether they will prove remunerative?—There is quite enough to enable one to tell whether they will remunerate, whether they will bear even their interest charge.

9487. Then you wish to express the opinion that already enough of these works is in operation to enable an opinion to be formed, whether they will be ultimately remunerative or not?—That is so.

9488. What is your opinion then, judging from the parts of these works that are already in operation,

Mr.
J. Geddes.
7 July 1871.

Mr.
J. Geddes.
—
7 July 1871.

operation, as to their future chance of being remunerative or unremunerative?—That they will not be remunerative. A million of money has been spent, and the works have been carried on over 10 years; I should doubt very much if the works which are completely finished would yield an income sufficient to pay the repairs or the working establishment or both.

9489. Do you think that that part that has been finished, forms a fair average sample of the returns likely to be yielded by the whole works?—I do; and the works have had the benefit of official influence, and of all the official encouragement which could be secured, so much so that I remember a leading zemindar in Orissa objecting, before the Famine Commissioners, to the then Commissioner of Orissa as being what he called stony-hearted, in this way, that he wished the water to be taken on terms which, according to him, would not pay the cultivator.

9490. Then what your evidence would lead to is this, that a million has been spent by Government in these irrigation works, and that the return will be not more than sufficient, even ultimately to cover the working expenses and the necessary repairs, and will not return anything of interest?—Will not suffice to pay the working repairs and the working establishment, and will therefore yield nothing for interest.

9491. Have you ever made any comparison from official and historical documents, as to the frequency of famines under native and British rule?—I have inquired into that very carefully.

9492. And what is the result of those careful inquiries?—My impression is that famines have been on the increase under English rule. That is not the general opinion among officials in India, I should add.

9493. On what do you base that opinion; to what cause do you attribute this increase of famine?—Many things, such as these. In looking at the history of the old famines for example, which is told in Hunter's "Annals of Rural Bengal," you find that he speaks, if I remember rightly, of a mortality of 10 millions in the famine of 1770, of a third of the whole population having been cut off. If you try to verify that extraordinary statement, it seems difficult to suppose that society could have gone on after a loss of 10 millions of people; that a population of 30 millions could have carried on any kind of social order, after a loss so great as 10 millions of people. It seems difficult to suppose that the meteorological conditions of the famine of 1770 could have been so universal, that they could have affected all Bengal, dry parts and wet parts, so very much and so uniformly, as to cut off so many people. Accordingly, on referring to the authority on which Dr. Hunter bases the statement, I find that it is merely a casual statement in a report of Warren Hastings, in which the Governor is making returns of the revenue, and those returns of revenue certainly do not bear out the statement that a mortality so great as 10 millions existed. For example, I have notes of the figures of the remissions, showing the extent to which the revenue fell short in that year. The net collections are returned in that very report of Warren Hastings which Dr. Hunter quotes in 1768-69, at 1,052,000 £, in 1769-70, the year of the dearth, at 1,031,000 £, in 1770-71, the year of famine and mortality, at 1,040,000 £, and in 1771-72 at 1,053,000 £.

9494. Then what you think those figures show

is that the famine could not have been severe, because practically from the figures which you have quoted there was no remission of revenue, or scarcely any remission of revenue?—The collections were very severe, and Warren Hastings, is explaining why he could not send home enough to pay the dividends; the pressure was very great to find revenue, and yet notwithstanding so great hardship the remissions granted only amounted to this trifle. Now the statement as to a third of the population having died is only a casual statement, controverted on the very face of it by the fiscal statements.

9495. You want to convey the idea, that if anything like a third of the population had died, or if the famine had been as severe as it was lately in Orissa, there would have been a great remission of revenue?—Yes, much greater than the figures quoted by Dr. Hunter would indicate.

9496. Was there a very considerable remission of revenue in the Orissa famine?—I have not the figures of the remission separately, but the figures of the famine of Bengal and Ganjam in 1866, purport to show the sums spent or remitted by Government as being 316,000 £.

9497. Which was a much greater remission than that in the famine which took place in 1770?—Much greater in proportion, Orissa and Lower Bengal are given at 249,129 £, that is spent or remitted, spent, that is to say, in relief, or remitted in revenue. The corresponding sums mentioned by Dr. Hunter, are those I wish to contrast. I have not got all the figures from Dr. Hunter. I am speaking partly from memory, as I only had a few hours' notice that I was to be examined.

9498. Can you quote from memory what the amount remitted and spent was?—From notes somewhat incomplete made some time ago, I think he says that there was a remission and relief of at most 80,000 £.

9499. You having expressed the opinion, which certainly is contrary to the opinions that have been often expressed before us, that famines are more frequent under British rule than under native rule, to what do you attribute the fact which at first sight certainly seems extraordinary?—To the necessity, under our Government, of disposing of more produce of the land for sale abroad than under native governments.

9500. And you think that it has been necessary to dispose of more produce for paying increased taxation?—Yes; and also, from the mere fact that the government is a distant one, whereby the cost of the transportation has to be borne by the native taxpayers. There must be a very great difference between a condition of society in which the produce of the land is consumed upon the land, and a condition of society in which a portion of the produce has to be deported to a place on the other side of the globe, and still more so when the industry of the taxpayer is only agricultural, and so cannot tender any other than bulky, unmanufactured articles, costly of transport and possibly liable to decay.

9501. But do not you think that this disadvantage, which you have attributed to the necessity of exporting produce, has been more than counterbalanced by the advantages that English rule has conferred upon India in carrying out public works?—No, I do not think so. If the cost of the public works is to be defrayed in India, certainly not.

9502. Then do you think, looking upon it simply as a financial question, that taking the public

public works as a whole, the burden which they have thrown upon the people of India in the form of increased taxation is greater in comparison with the advantages which they have derived from having those public works?—Most certainly; for example, in the case of railways.

9503. But should you say, speaking generally, that the railways up to the present time have conferred no financial advantages in India on the general mass of the people?—No advantages commensurate with the cost. For example, they have never paid their own interest charge on any fair way of stating the expenditure of the railways.

9504. Have you any facts by which to sustain that opinion with regard to every line, that no line has paid its interest charge?—Yes; of course I am aware that the accounts of some of the railway companies, at least those of the East India Railway Company, do purport to show that they have defrayed their cost and earned over the guaranteed dividend in some half-years.

9505. You seem to say that the accounts of these railways are even more unfavourable than they are represented to be; would you give us some figures to illustrate that opinion?—In the 42nd and 43rd paragraphs of the last Parliamentary Railway Report (Mr. Danvers' General Report), he says, "It would thus appear that a sum of 15,864,344*l.* has during the last 20 years, while the railways have been in course of execution, been drawn from the revenues of India for the payment of the guaranteed interest." This gives an average of about 793,000*l.* a year. In some years it has amounted to more than twice that sum; in others it has been much less. The largest sum was 1,700,474*l.* in 1868-69; the smallest 67,043*l.* in 1865-66." He goes on to say, "While the State has been making this annual contribution towards the railways, it must be borne in mind that it has for some years derived a direct pecuniary benefit from them, both by the conveyance of mails free of charge, and the conveyance of troops, both horse and foot, at the lowest fares, and their baggage, ammunition, camp equipage, and equipments, at the lowest rates chargeable for goods of that kind. The saving thus effected must be considerable, and nearly, if not quite equivalent to the amount of the annual average charge hitherto incurred by the revenues of the country for the guarantee. This charge, it may be hoped, will gradually diminish as the lines are completed, and the deficit ultimately converted into a surplus." In the rest of the Report, and in other Reports, he gives the usual statements of the capital account, and of the traffic returns, and of the guaranteed interest. But those capital accounts not only are never closed, but are being perpetually kept open. Therefore these accounts seem to me to be insufficiently stated. For example, I shall quote from a Minute of Lord Lawrence, of the 16th of August 1867, in the Parliamentary correspondence relating to extension of railways in India. He says, "I would take this occasion also to affirm plainly what is too often overlooked, that the Government in its relation with these guaranteed railway companies is by no means an intrusive power which has no pecuniary interests at stake which it may legitimately protect. It is estimated that while the companies will have to supply about 81 millions for the railways now under construction, the Government contribution will be 7½ millions for land, loss by exchange

0.59.

and supervision, 14½ millions for interest paid in excess of net revenues, and 4½ millions in interest due on those payments of guaranteed interest. In all, the Government will have paid 26½ millions against the companies' 81 millions. This is no visionary contribution, and it is monstrous to say that under such circumstances the Government is doing anything beyond its plain duty to the Indian community when it requires that every possible precaution shall be taken to prevent waste." So that in taking the accounts, for example, at the figures put in 1867, it would be necessary for any just view as to whether the railways are remunerative or not to exhibit in the capital account not only the 81 millions of the companies, but also these 26½ millions of the Government subsidy. It would be necessary to debit a charge for the interest on these 26½ millions, to include in the reckoning of the annual expenses a charge for the interest due to the Government on the 26½ millions; for these 26½ millions were not obtained out of annual revenue.

9506. Sir C. Wingfield.] Might I ask, does that 26 millions comprise the loss of revenue on the land given to the railway companies?—Yes, I see it does; seven and a half millions for land is, I presume, the actual compensation. Whether it includes the revenue, annual revenue demand (the Jumna or annual land-tax) of the land acquired, I do not know. I am not sure that the revenue which the Government write off in their books, having made over the land, is included in the above calculation of Lord Lawrence.

9507. Mr. Fawcett.] So that, basing your opinion upon that Minute of Lord Lawrence's, if you wanted to represent the financial position of the railways correctly, you would say that the Government have guaranteed 5 per cent. upon a capital of 81 millions spent by private companies, and that, in addition to that guarantee, they have subsidised the railways by an expenditure of 26½ millions?—That is so, I think.

9508. I understand that, leaving out of consideration the subsidy of 26½ millions, and taking simply the fact of the guarantee, the Government lose at the present time about a million, and three quarters annually, do they not?—The loss, I think, is a million and a half, you may take it so generally, and in the last Budget, I think, it figured at 1,800,000*l.*

9509. But looking to the future, supposing that the railway system will be continued and developed, do you think that that loss is likely to increase or to decrease, and would you mention any facts on which you base your opinion, whatever it may be?—If the railways go on as heretofore, I do not think that the loss will decrease.

9510. I suppose you would think that it will not decrease, because you think that the best lines of country have been occupied, and that the new railways will be carried through countries which are not so productive for railway enterprise as those through which the railways at present run?—That is so; and also as to the capital accounts on existing railways, they never do close them definitely, and say, "We will not have any more expenditure debited to capital."

9511. So that, as a matter of fact, even on the existing railways whose returns are not sufficient to pay the guarantee of 5 per cent., the capital account is never closed?—I think not; for example, on that Great India Peninsula Railway, which has been referred to, a sum (I have seen

3 L

Mr.
J. Geddes.
7 July 1871.

it

Mr. J. Geddes. 7 July 1871. it stated differently: 1,300,000*l.*, I think, it was stated at by the Secretary of State) was expended in rebuilding bridges and viaducts which, as the Duke of Argyll said, had come down by the run. I have looked in Mr. Danvers' Reports to find some figured information about that affair, and I have not found it.

9512. Some of the railways that have lately been carried out have been rather military railways which are said to be very remunerative, for instance, the railway to Peshawur?—I have no personal knowledge of that country.

9513. Do you know anything of a railway upon which evidence has been given here; can you mention any of the circumstances which caused the Government to buy a railway from Calcutta to Port Canning for 400,000*l.*, which railway does not pay half its working expenses?—I do not know anything more than simply what was published. The railway failed to pay its working expenses, and the Government, under the provisions of the charter, which could have been enforced here by action in Westminster Hall, I presume, bought it up. The amount in question I think was 600,000*l.*

9514. Do you know what practical course is adopted to give the Government sufficient information to enable them to decide whether such a line as that ought to be guaranteed or not?—I have no official knowledge or personal knowledge of that; I merely know as any other resident in India would know.

9515. What is the opinion amongst the residents in India as to the course that was adopted?—Certainly the general opinion among the residents in India is that the railways will pay; the common opinion is that if a sufficient distance of time be allowed they will pay. I am stating my own opinion.

9516. Do you know anything about the capital that was spent on a railway that was alluded to at our last sitting, the Jubbulpore branch of the East India Railway, which, during a half-year, did not pay its working expenses?—No; I have merely travelled over it; that is all.

9517. To what circumstance do you attribute the fact that the railways cannot pay this guarantee of 5 per cent.; do you attribute it to the general poverty and unproductiveness of the country, or do you rather attribute it to a great waste of money which has been going on while the railways have been carried out, and to the extravagant cost at which they have been constructed?—I should rather attribute it to the impossibility of getting railways made on any system that would pay; the inherent impossibility, I mean, of English-made railways paying in India. I think that the country is too poor to afford English railways, and, certainly, too poor to afford English railways in which the shareholders have very little responsibility.

9518. What you rather mean, I suppose, is this: that if the Government guarantee 5 per cent., the shareholders getting a remarkably good return for their money, there is no interest to practise economy?—That would be too much to say. I would not say that.

9519. Then do you think that the railways have been carried out on too expensive a system; that they have been made too costly?—Certainly, judging from the results.

9520. You have just spoken of the poverty and general unproductiveness of land in India; that

opinion is contrary to the general notions on the subject, is it not?—Yes.

9521. Have you ever made any comparison as to the yield of land in India with that in England?—The general idea is that India is a very rich country.

9522. Have you any facts to mention on which to base that opinion of yours?—It is very difficult to obtain any precise statement on that point; but so far as my inquiries have extended I should say that the yield of cereals from land in India per acre was less than in England. I should say less for cereals, as compared with English produce, or for cotton as compared with American.

9523. *Chairman.*] Perhaps one-half less?—The official figures usually published certainly would make it that or under that. I think they would make it for cereals 800 lbs. per acre in India (and I think it would be considered a good crop in India), and 1,600 lbs. in England. But as to the statements of the yield of land it is very difficult to get reliable statistics of that.

9524. *Mr. Hermon.*] Do you take into consideration the relative value of the land in India and the land in England?—That would not affect the amount of weight of cereals.

9525. *Mr. Fawcett.*] Before I leave the subject of Public Works and Railways, is there any other remark that you would like to make on them?—I would point out, for example, that in taking over the Orissa Irrigation Company it was well known that the company had been paying dividends out of capital, and it was notorious that the shares were at a discount.

9526. Then did the Government take over a company whose shares were at a heavy discount, and take over the shares at par?—I believe so.

9527. Did they give anything besides that?—I think they gave 50,000*l.* as a bonus, and they gave also 14,000*l.* to give up a scheme called the Behar scheme, for which the company had some kind of promise, but for which they were unable to raise the capital.

9528. Then is it your opinion that a company whose shares were at a very heavy discount, and which had been notoriously paying dividends out of capital, was bought by the Government at par, and received 50,000*l.* in addition?—I believe those were the facts.

9529. And you state that opinion after perusing the documents?—Yes.

9530. *Mr. B. Denison.*] You have seen the controversy on the other side of course?—I have heard that the company were very much dissatisfied. I carefully examined a file of "The Times" on the subject.

9531. *Mr. Fawcett.*] You have made some general remarks with regard to the future prospects of railway enterprise in India. Have you any general remarks to make with regard to the future prospects of irrigation works?—Yes; the general theory upon which they are constructed, that they will save the land revenue seems to me financially futile. If the land revenue requires to be saved, it is obviously too high; if it is precarious and liable to be lost, it is too high, and should be lowered. It would be more sensible to lower the land revenue demand. You cannot call it remunerative to retrieve a precarious source of income. If there was a surplus upon which to build a canal, it would be very well; but judging from the past results, I think it is not prudent to borrow money to build these canals,

canals, and it seems to be unreasonable to propose to borrow money, merely on the ground that you save your land revenue, and that you save the people from famine. The existing land revenue must be too high in that case.

9532. I wish to convey your meaning as clearly as possible to the Committee; what your opinion would go to is this, that these irrigation works are so uncertain in their returns, that you do not think that Government is justified in carrying them out with borrowed money, although you think it may be justified in carrying them out if they have a surplus?—I do not think it is wise to build them out of borrowed money, if the lenders expect to be repaid their principal.

9533. But are not some of the irrigation works in India very remunerative, for instance, the Madras irrigation works?—They have usually been said to be so, but I think that is mostly by crediting land revenue receipts.

9534. They mix up the land revenue, and you may say, an irrigation rate together, and put it all down as return to the irrigation works, you mean?—That is the nature of much of the returns, for example, on which Sir Arthur Cotton bases his statements of the extraordinary remunerativeness of the irrigation works in Madras. Among the Papers on irrigation works laid before Parliament some time ago, there is a very careful Report by Colonel Strachey on that subject, the general tenor of which is that the capital accounts have never been made up in any rational way.

9535. And does this paper of Colonel Strachey's go to corroborate the opinion which you have expressed, that land revenue and irrigation rates are mixed up together, and all put down as a return to irrigation work?—Yes; but Colonel Strachey certainly thinks that irrigation works do pay, that they are remunerative.

9536. But looking at the question as one of general taxation, I suppose you think that as a railway or an irrigation work confers simply a local or district advantage, it is unfair to tax the whole people of India to carry them out?—Yes; I think it is monstrous to tax the people of Burmah in order that cotton may be carried down cheaper to Bombay.

9537. You say, for instance, that the Burmese people who have never seen a railway are virtually taxed in order to get down the cotton cheaper to Bombay?—Certainly.

9538. And that you think is unjust?—Yes; the Burmese people have to give their quota to the Imperial revenues, which go among other things to pay the interest on unremunerative railways.

9539. With regard to the general revenue and expenditure, what are your views as to the prospect of expenditure increasing or diminishing, and the revenue increasing or diminishing?—I certainly think that the expenditure is always on the increase, and on the increase more rapidly than the revenue is increasing. I think also that this is a permanent feature of Indian finance. I think that our cost of administering India increases more rapidly than the natives' capacity to pay for it.

9540. Why do you think that the increase of expenditure is likely to be a permanent feature of Indian administration?—One of the normal features of life in India is the everlasting enhancement of the price of food, dating for example

very largely from about the mutiny time; the era of the great expenditure of borrowed money by the Government and by the railway companies, and the era of the great drain upon India for the interest charge upon these expenditures. That enhancement of the price of food is very largely due to the necessity of exporting a great deal of the country's produce to pay for the loss in guaranteeing the dividends on these railways, and also to pay for the interest on the monies required to make good the frequent deficits of Government. Moreover the entire cost of administration rises at the same time in proportion. Every service that the Government requires has to be carried on at a constantly increasing cost. That is one reason. Another reason is that the standard of comfort in England rises, and therefore the cost of the army in India is constantly on the increase. If it were possible to get a chronological return of the amount paid for compensation to the native troops for the dearth of provisions from year to year, I think you would have a clear statement, which would be something like a measure of the increasing dearth of food.

9541. Sir C. Wingfield.] I think the rule is that if the price of grain be above 16 seers the rupee, then they get compensation; is not that so?—That is the principle of it, and therefore the aggregate of over price which has to be paid to all the sepoys, year by year, would be a fair test. I suppose it will appear in the statistics of the ensuing military part of the financial serial which is now being published in Calcutta.

9542. Mr. Forster.] You think, then, there has been a great increase of prices, and that there is likely to continue to be an increase of prices, and that as the price of commodities is increased the expenses of Government must increase?—Yes, that is so, and that the natives have not all of them a commensurate advantage for that. Among the consequences of the compulsory exportation of produce to pay for foreign charges is, I think, the frequent cattle disease in India. Greater and greater areas have to be put under crop, cattle have to be worked more and more, the area of pasturage diminishes, and much of the produce has to be shipped away to meet the payments in London; and that is the reason. It is because of the hold that we have of India, that our trade with India is so much larger than that of any other country is.

9543. You rather agree, I suppose, with the opinion that I have seen expressed in the Calcutta correspondent's letter in "The Times;" that, for instance, taking Malwa, people there are suffering from this circumstance, that a considerable area of their country which before was devoted to the growth of food which was consumed by the people is now given up to the growth of cotton and opium for foreign exportation?—Yes; but you have to notice the conditions that there are in that country. In the country of which I suppose "The Times" correspondent was speaking, you have partly a native Government. Of course it is the influence of the English Government under which any considerable area is devoted to opium. The market for opium would cease if our gun-boats in China ceased to enforce our treaty rights there, and it is certainly under our influence that its growth is maintained. If we left India, there certainly would not be so much cultivation of opium;

Mr.
J. Gredes.
7 July 1871.

Mr. J. Geddes. opium: the native priests would very soon dispose of it.
7 July 1871. 9544. You have referred to one circumstance affecting the expenditure, namely, the gradual and steady increase of prices going on, but how do you consider that the rise in the standard of living in England, and its becoming more expensive, affects the cost of Government in India?—

The English soldier is not to be recruited, except on harder and harder terms. The figures of the increase of cost of the army are of course notorious; the army expenditure is constantly on the increase. I spoke just now of the exports. From the Government Table in the Calcutta annual statement of the trade and navigation of British India, dated 1870, which gives a review from the earliest time of the trade, and which is part of a financial series now in publication, it appears that the Indian trade with England amounts to about 45,000,000 £ sterling (exports and imports together), and that the coasting trade of the Indian seas amounts to 21,000,000 £. So that you have this fact. The maritime exchanges of a population of 200,000,000, in India with each other amount to only 21,000,000 £ sterling, and the maritime exchanges with England, a remoter population on the other side of the globe, and of only 30,000,000, amount to 65,000,000 £ sterling. The disproportion also is really much greater than the figures indicate, because much of what is set down as coasting trade represents goods on their way to or from England, but entered in the minor ports of primary entry or discharge. In fact, it is simply the circumstance that we have the dominion of India that makes our trade larger for the most part. I refer to all this with reference to the increased cost of food.

9545. What you mean to convey by saying that the rise in the standard of living in England affects the expenditure in India, is this, that as labour becomes more expensive in England, and commodities become more expensive in England, everything that India obtains from England, namely, the labour of her soldiers and other people, and also her commodities, she will have to pay a higher price for?—That is so, and it will continue until the services to India will be given on other than merely the principles of self-interest: I mean, so long as it continues a matter of remuneration, calculated merely on self-interest, and until England looks upon the dominion of India as a duty to be administered partly at the cost of England.

9546. Still whoever pays for it (and I do not think there is much chance of England paying for it), the services which England renders to India in sending her commodities and labour, of course will involve a larger charge as that labour and those commodities become more expensive. That is what you wish to be understood, is it not?—Yes, but I express no opinion as to the probability of England agreeing to defray any part of the cost of India.

9547. Now you have alluded to circumstances on which you base the opinion, that expenditure in India is likely to continually increase; can you state any reasons which justify your opinion, that revenue is not likely to increase with increasing expenditure, and in the same proportion?—Yes; the history of Indian finance shows that. I question very much, for example, whether our net land revenue defrays the cost of our army. The figures of the net land revenue for example, from 1814–15 to 1868–69, are given at

pages 28 and 29 of Part 3 of the Calcutta Financial Serial. In the last year 1868–69, the land revenue gross is set down at 22,374,936 £ sterling, and the net land revenue is set down at 19,669,369 £. Now I have a statement of the cost of the army for that year 1868–69. The cost of the army in that year may be set down generally:—

	In India.	In England.		TOTAL.
		Stores.	Other Charges.	
	£.	£.	£.	£.
I. Army proper	12,989,500	872,621	2,407,301	10,269,581

9548. Sir C. Wingfield.] But there is a recovery on the other side under stores?—I have given the land revenue, gross as well as net, and I can only indicate the comparison generally. But I fancy the *per contra* of receipts by sets-off from the army is slight. Then proceeding with the remaining items of the cost of the Indian military system, there are also these charges all debitable to the military expenditure:—

	£.
II. Marine	790,791
III. Stores	248,401
IV. Other charges	101,450

Then:— 1,140,690

V. Ecclesiastical, which is mainly a military charge	163,500
--	---------

VI. Medical service (also mainly an army charge)	380,361
--	---------

VII. Public works entered under the general heading Public Works, but obviously nothing else than a military charge:—	
Public works, military construction	1,876,157
Public works, military repairs	249,397

Total Public Works, Military	2,125,554
------------------------------	-----------

Grand Total of all the Military Cost, including Transport, Medical, and Ecclesiastical Services	£. 20,079,717
---	---------------

Of course the medical services contribute partly to the civil expenditure, but it is mainly a military charge, and on the other hand, the army gets services from the civil department. But, generally speaking, there remains this result, that the cost of the army is unpleasantly near to the proceeds of the land revenue.

9549. Mr. Fawcett.] Then you think that those figures show that the net revenue of the whole land of India is absorbed by the cost of the army and navy?—Yes; and the land revenue must always be the main source of income from an agricultural people. You have also this fact, putting it in another way. The exports, say, putting them roundly, are 50,000,000 £, and thus you have a country yielding exports of 50,000,000 £, required to contribute 20,000,000 £ sterling for an army.

9550. Now, looking at the land revenue for the next 20 or 25 years, what is your opinion as to its elasticity or inelasticity?—I certainly think that the revenue does not increase in proportion to the expenditure; I think that the expenditure is very elastic, and the income very stationary.

9551. I will come to other heads of expenditure; but now, with reference to the land revenue,

revenue, do you say that?—Yes, I do. If you look at the figures of income from land revenue, and expenditure on account of land revenue, for example, in this Calcutta Serial, in the first part of it, at pages 14 and 19, I think you will find that the increase in the cost of assessing the land revenue takes up a large proportion of the increase which is shown on the other side as income.

9552. Mr. J. B. Smith.] Is that every year?—That is the normal feature of it.

9553. Would those expenses of assessment be an annual expense?—No; not all of them, certainly; but you have also, for example, the pension charges for the collectors. Those are a permanent charge. In any case the net proceeds of the land revenue continue much the same, year after year, if you put annexations aside.

9554. Mr. Fitchett.] With reference to the land that has been settled, either permanently or for 25 years, of course there can be no increase with regard to the permanently settled lands, and no increase as to the land settled for 25 years, until the lapse of that time?—I do not know about that. Of course the arrangement for local cesses may obviate part of that difficulty.

9555. I will examine you upon that point presently. You could not on this land put an additional cess for anything that was considered an imperial purpose, could you?—No, that is generally held.

9556. Should you say that generally the land of India, considering the just rights of the people, would bear a much heavier assessment?—No, I should not.

9557. Do you think it is heavily assessed at the present time?—I think it is heavily assessed, I speak generally of India. In Lower Bengal of course the Government proportion, as is well known, is comparatively a small proportion of the produce. Anyone who was acquainted with the literature of the settlement, the settlement reports, will find that we are always ready enough to acknowledge that in the past we have over-assessed districts; for example, in the Nerbudda and Sangor territory, in Cawnpore and Bundelcund we are now ready to acknowledge that we had over-assessed districts. Sometimes society broke down altogether under the weight of the assessment.

9558. Sir C. Wingfield.] May I ask whether your services were confined entirely to Lower Bengal?—Yes, my services were confined entirely to Lower Bengal; I quoted the Settlement Literature.

9559. Mr. Fawcett.] With regard to the other sources from which Government can obtain revenues, could the Government obtain additional revenue from increasing the taxes on commodities?—No; as I said before, the increase from exports and imports is very small, and indirect taxation will get very little from customs. If you look at the history of the customs revenue, if for instance you refer to the tabulated column of customs income, in the third part of the Government series of financial statements from 1792-93, you will find that customs remain very stagnant as a source of revenue. Just after the Mutiny, it was attempted to enforce as large an income as possible from customs, and the trade of the country was injured at that time. You will find an increase of customs about that time, and you will find, I think, the customs income diminishing immediately after that, so much so, that certain customs duties had to be withdrawn.

9559.

About a generation ago, you will find that the customs revenue appears to have been larger proportionately than now; very much larger allowing for the increase of territory, but that was owing to the system of transit duties, which were at that time credited in the income, and which have long ago been abolished.

9560. Mr. J. B. Smith.] You said that the customs had increased very much after the mutiny; that (*handing an abstract Statement to the Witness*) does not bear out that!—I am speaking of course financially. I am speaking of the financial sequents on a given antecedent, and the financial sequents do not appear in the column till some time after. The mutiny ended in 1858, but the accounts were not brought up till 1859-60 or so.

9561. After the mutiny, of course there would be a scarcity of everything, and an increase on that account?—The rate per cent. of customs duties was increased at that time on several staple articles, about 1859 or 1860.

9562. Mr. Fawcett.] What you mean to say is this, that comparing the customs return since 1792, they show that the people of India are such small consumers of foreign produce that the customs duties have no natural tendency to increase very much?—Not enough for our increase of expenditure.

9563. And if you attempt to increase their rates of export what took place after the mutiny, when the rates were increased, shows that such an increase so materially affects the trade of the country that it has to be abandoned?—Yes, the natives consume very little sea-borne commodities, and what they do consume are already taxed very high. It is almost a normal feature of the Calcutta Budget statement that the Minister congratulates the country on the increase of exports and imports, and puts it forward as a ground of confidence in borrowing, but at the same time regrets that he is unable to secure an increase of revenue and income from such an usual source as customs.

9564. With regard to the duties levied on internal produce, could the salt duty be increased?—I think not, properly.

9565. Do you consider that at the present time (you can, of course, speak from experience) it does press heavily on the people?—I think it does.

9566. Do you say that from having complaints of the natives?—Certainly. The cost of salt is an ordinary thing to speak about. Any native whose recollection goes any time back will always tell you about the increase on the salt duty as one of the hard things: I imagine that in the time of the Nawabs of Bengal it was 2½ per cent. on prime cost to Mahomedans, and 5 per cent., that is double, to Hindoo consumers. Now, taking the rate per cent. on prime cost of the salt as set down, for example, in these figures here in the Calcutta serial, and comparing the selling price of salt, and the rate of Government duty, you find a taxation of, I think, 700 per cent. But even that will probably not indicate the full enhancement of cost due to the Government. The rate of duty, I see, has been stated to the Committee to be as high as 2,500 or 2,800 per cent. I have no doubt that the rate of taxation in the past was understated, that actually more was levied in the Nawab's time, but it certainly was not anything like the amount or rate of duty that it is now.

3 L 3

9567. Then

Mr.
J. Geddes.
7 July 1871.

Mr. 9567. Then you think that it is an onerous and
J. Geddes. oppressive tax which it would be not only un-
 7 July 1871. safe, but unjust to increase?—Certainly, I think it would be unjust to increase it; I think it would be a very hard and a very unfortunate thing to give the police underlings, men who are insufficiently paid and untrustworthy (as any police must be that foreigners can secure), greater control in salt matters.

9568. With regard to other duties, such as stamps, could we get any additional revenue from increasing the stamp duties?—I do not think so. My own feeling is, that that is higher than it ought to be, that if we cannot administer justice more cheaply we should withdraw.

9569. Then do you think that to a poor suitor in India justice is expensive?—I think it is very expensive. In land revenue and other items he already contributes very largely, and I think it is very hard, for example, to require a man to pay one rupee for leave to put a written complaint before the magistrate; that is about from four to eight days' earnings, although he has already presumably paid his quota to the Government in salt and land revenue.

9570. But has he to pay a rupee, however small the amount may be in dispute, on lodging a complaint with the magistrate?—Yes; and I am speaking only of criminal complaints. I believe that the tax has been lowered since I came home. I thought it very high. This is quite apart from the stamp duties in civil suits.

9571. With regard to excise, if more revenue is required, could you suggest any increase of existing excise duties, or the imposition of excise duties not now levied?—No, I think not; I do not think that there is any chance of realising any considerable increase of revenue from excise, and besides, the feeling of the native population certainly is very hostile to all our excise system.

9572. Is it hostile because they think that it is contrary to their habits?—They think that it is contrary to their religion. It is a commonplace among the natives to speak of the increase of drunkenness and habits of intoxication as one of the things which the English have brought in with them.

9573. But how can the imposition of an excise duty be connected with drunkenness; I should suppose that if you put a duty on an article which causes intoxication, you rather tend to diminish drunkenness than increase it, because you make the intoxicating article more expensive?—But what the natives mean is, that if their own religious system were left to deal with intoxication they would put it down very soon. They would put people out of caste, for example. But one of the things which they would have to deal with would be the masters of 200,000 bayonets, whose officials are constituted authorities for purveying opium.

9574. You are referring now rather to the opium?—Whose officials are, to the Government, constituted authorities for purveying opium, and for controlling sources of excise.

9575. Then do you think that if the Government did not require revenue from opium, less opium would be grown in India?—Certainly, less opium would be grown. It is useless to speak about free trade, when you have, for example, a Finance Minister in India entering into competition with the village loan-monger, and directing the proceeds of taxes into the growth of particular staples. The village loan-monger

would raise other staples, most probably grain or food, but he cannot compete with one who is the master, who wields the Government treasuries.

9576. But if opium is a profitable commodity for the English Government to grow, it would be equally profitable, would it not, for a native Government to grow, and under these circumstances it would be grown for the sake of the profit, would it not?—If you speak of India entirely under a native system of administration without us, I say that the priests would settle that. No rajah under a purely native system, could administer the opium revenue as we administer the opium revenue. The Brahmins would very soon starve him out.

9577. Then do you think that the mere fact of the English Government encouraging the growth of opium produces a demoralising effect on the natives as the influence of English rule?—I think that it does produce a bad effect; that it breaks down their confidence in their own religion, and I think that a greater evil than any good which we confer upon the natives.

9578. Looking at it purely as a financial question, what do you think of the prospects of this revenue increasing or decreasing, or as to the certainty of its continuance?—I think it only a question of time when it will break down. It is only a question of time, for example, when the Chinese Government will insist on the control of their own ports, and will have the countenance of the Americans, now their next door neighbours, and of other nations, in securing the full control of their own harbours. We shall not be able to maintain treaty rights in China; having had to abandon a treaty in the Black Sea, we are not likely to be able to continue to enforce in China treaty rights which were not very creditably obtained. With the fall of our treaty rights in China the Indian opium revenue would fall.

9579. Then you think that prudence would dictate that the Indian Government should so arrange its finances as to calculate that this source of revenue, amounting to between 7,000,000 £. and 9,000,000 £., is a precarious one?—Yes; and not only so, but that it is a faulty system to treat as revenue, that is, to spend every year all they can get from opium, seeing that it is a very fluctuating source of income.

9580. Now with regard to the income tax, it is often said that the rich do not contribute enough. What is your opinion about the income tax?—I think that the native incomes are almost habitually over-stated and over-estimated (of course not willingly so), in all our official calculations. The income tax also, at least up to the time when I left India, seemed to me to press unfairly, owing to the institution of the native joint family. If you have an English family of five people, subject to an income tax, they can effect their retrenchment upon luxuries or comforts before trenching upon necessities. But the Hindoo income is the income often of many families, owing to the institution of the Hindoo joint family. Therefore, an income tax in the case of the Hindoo, tends to trench on necessities, in a way that it is difficult for an Englishman to understand. For example, the mere statement that the rate of the income tax was only 3½th per cent., could give no idea of the feeling created by it among the natives. That might be a very much higher rate to a native family than the figures would indicate to an English mind. I believe there has been some change, and I think a provision

a provision was attempted to be made on behalf of the Hindoo family last year; but I have never been able to ascertain what changes were introduced; nor do I see how the hardship could be remedied without forfeiting the bulk of the proceeds of the income tax.

9581. You mean that this sometimes happens, that if, for instance, an income of 1,000 *l.* a year is rated to the income tax, it does not mean as it would in England a separate income belonging to one family of 1,000 *l.* a year, but represents, owing to the joint family system, many incomes of 100 *l.* a year each which are so taxed?—Yes; what we should call incomes of 100 *l.* a year administered, as it happens, by the one head of all the families, the set of families.

9582. The Financial Secretary of the India Office said, in his evidence, that he was not aware that any official statement had ever been made that the income tax had produced discontent in India; can you express any opinion on that point?—I am very much surprised to hear that.

9583. Have you ever made any official statements on the subject?—I remember remonstrating against the income tax in Pooree, the southern district of Orissa. I said that it was very unwise to assess to income tax the people of Pooree, a district which had just lost from 20 to 30 per cent. in some portions of its population after the famine, especially when that population was mainly the working bone and sinew of the district.

9584. That opinion you expressed in a remonstrance addressed to the authorities?—Yes.

9585. Should you say from your personal knowledge that the income tax had produced wide discontent?—Yes, I would, certainly.

9586. And that this discontent is not, as has been officially stated, confined to an insignificant section of the people?—No; it reaches very far.

9587. Owing to the joint family system?—Not only owing to the joint family system, but owing to their uneasiness at what seems to be the arbitrary nature of the system, and also to our inability to control all the underlings whom we require, not so much from any extraordinary viciousness of the native character, as from our essential inability to secure trustworthy underlings.

9588. You would say that it was impossible to levy it in a satisfactory way?—That is a very strong statement to say that it is impossible to levy it in a satisfactory way: I think it is impossible for us to levy it in a satisfactory way.

9589. Before we leave this subject, is there any other opinion that you wish to express on Imperial taxation?—I think that I should express anxiety about one item which appears always in the finance statements, the item of interest in the headings of revenue. Part of that interest was formerly an income from waste lands, but a great proportion of it is the proceeds of the currency department of the Indian Government. The Indian Government is the sole issuer of compulsory paper tender in India. In their statements of currency, the Currency Department is always made out to yield a profit. At page 116 of the third part of the Historical Review of the Finance and Revenue Accounts of Government from 1862 to 1869, the Currency Department professes to show in 1862-63 a deficit of 37,850 *l.*; in 1863-64 a deficit of 3,768 *l.*; in 1864-65 a net profit of 125,839 *l.*; in 1865-66 a net profit of 83,330 *l.*; in 1866-67 a net profit of 67,055 *l.*; Q.59.

in 1867-68 a net profit of 103,651 *l.*; and in 1868-69 a net profit of 72,603 *l.* The statement resulting in these out-turns seems to me insufficient, because the Currency Department does not debit the cost of carrying about the silver, which has to be moved about to meet the different payments. The effect of the Currency Department is to transact a large proportion of the exchanges of the country, and at the cost of the general revenues, at a loss to the country at large. The Currency Department professes to show a profit; but as I said it does not show the cost of transporting the silver and bullion throughout the country. Not only so, but the annual profit attempted to be claimed seems to me a very doubtful set-off to the very serious risk of Government holding large sums in currency. If there were a serious commercial crisis in Calcutta, and the Government were required to make good the amount of their notes, if there were a black Friday, say at Calcutta and Bombay, and notes generally were returned for encashment in Calcutta, the Government would have to throw a great many of their securities suddenly upon the market in order to realise silver with which to make good their demand, and they would either have to hurry an Act through Council, making their paper compulsory discharge even when tendered to themselves, or else they would have to raise the additional money required in that sudden way on very hard terms, and possibly they might have to face more serious disasters.

9590. With regard to local taxation, that is increasing, is it not?—It is; municipal cesses and others are constantly increasing very much.

9591. Have you any opinion to express as to the policy of the Government levying a cess upon land for education and roads?—In regard to Lower Bengal I have very grave doubts about the success of the measure. It is a very serious matter to interfere with the very complicated tenures which exist in Bengal. The system is quite unlike any of the tenures in this country. Between the Government and the actual cultivator you have whole strata of intermediate tenures, some of them held on the joint family system. You have normally a superior stratum intruding to oust the lower stratum, and to get itself nearer to the cultivator, so as to intercept the larger rent. You have the parts of one stratum litigating against another stratum. Now to interpose, as it is proposed to do in such a system, say, by enabling the superior tenants to recover from the lower tenants in any summary manner, seems to me to involve a very serious risk of disturbing the entire society in Lower Bengal.

9592. Then do you think that it is regarded as a breach of a monetary engagement?—Certainly.

9593. That is the prevailing opinion, is it?—Certainly among the natives.

9594. Mr. J. B. Smith.] Your answer refers to Bengal?—I am speaking of the permanently settled districts of Lower Bengal.

9595. Mr. Fawcett.] Considering the amount that is now levied in India by the British Government, both imperially and locally; have you ever made any comparison of the amount of taxation now imposed on the Indian people with the amount imposed upon them by their native rulers?—No, it would be quite impossible; the very currencies in which such figures are stated

Mr.
J. Geddes.
7 July 1871.

Mr.
J. Geddes.
7 July 1871.

are different. You could not get the local taxation exhibited anywhere in any official statement; I question whether the Government of India has a statement of the municipal resources and municipal taxation. Certainly no private individual could obtain anything of that kind. Therefore I cannot make a figured comparison between native and English administration; but I should suppose that under native governments, the taxation would not be so high as under the English Government.

9596. Mr. Bourke.] What native governments are you alluding to?—The native governments which preceded us.

9597. Would you give the Committee some grounds for your supposition?—You have no splendid cities, such as Delhi and Lucknow were, you have no Tajmahals, you have no clerical class yielding a purely native literature.

9598. I do not see how that is an answer to my question?—I spoke of native wealth under native and under English administration respectively, and I instanced the differences as to a leisured literary class as one of the examples of the change.

9599. I understood you to allude to the taxation of the people, that it was less under the native rulers than it is under the British?—I spoke of that as measured by the amount of wealth left to the people under the native and under the British Governments respectively.

9600. Mr. Grant Duff.] Do you mean that the Tajmahal was an evidence of the wealth left to the people after the taxation had been taken from them?—Yes, left to the people. I said the people, because our public works, our gaoles, and our kacharis, which are our set-off, are not a very beautiful set-off against the fine temples of the native people. They are for our purposes. Our barracks, say, are for our purposes. I distinguish between the English barracks and the native temples. You have, for example, fewer native temples now built. I think you have fewer groves planted, and, as I said before, I think you have more frequent famine now.

9601. Mr. Fawcett.] Is the taxation severely felt by the Indian people; does the frequent imposition of new taxes produce discontent and cause annoyance?—If it were not for the increase of the trouble, if it were not for the new taxes brought out every now and then, the people do not say so very much about the weight of taxation. When I speak of the weight of taxation, I speak of it as compared with the taxation of any other people. But you know that the Hindoos are a remarkably patient people; they accept things that come very much as the will of God. They are very much broken up by their own castes into separate systems, and they have very little of that communal opinion, of that public opinion which we understand when we speak of opinion on taxation.

9602. But there are no means of really ascertaining the opinion of the natives, are there or not, as much as there were under their own governments?—No. For example, we could not collect the land revenue in the way in which the native Governments often would collect the land revenue. We could not collect it in kind. We, with the comparatively little knowledge which a foreign Government can have of its underlings, could not set millions of bailiffs to take the Government share of the produce over the millions of threshing floors throughout India.

9603. Have you any opinion to express as to any practical means which could be adopted to get at the opinion of the natives more largely?—I think that if there were greater consideration for natives, we could ascertain their feelings more fully, but not if we are constantly saying, whatever your opinion is, we mean to overrule it.

9604. Mr. Cave.] Do I rightly understand you to mean that native rulers collected their taxes by means of millions of bailiffs?—I spoke of the whole of India. The native governments, of course, were much more like western communes than the large concentrated empire which we have; it was more like the system of the feudal governments than that of the concentrated Roman jurisdiction. As a rule, taxation was levied very largely in kind under native governments.

9605. And by millions of bailiffs?—By millions of bailiffs, taking all India together.

9606. Sir C. Wingfield.] Surely for several centuries in the greater part of India, money rents have been substituted for grain?—Perhaps I should say hundreds of thousands of bailiffs. I was thinking merely of general figures when I said millions.

9607. That change began centuries ago; but then in the early records of Bengal we find that a hundred years before we were there the rents were nearly all paid in money?—Yes; I said that the revenues were “largely” collected in kind.

9608. Mr. Ince.] I believe you wish to give some evidence as to the discrepancies between the Calcutta Blue Books and the account of the revenue and expenditure made up at the India Office, do you not?—Some time ago in a pamphlet which I published, I pointed out certain discrepancies; I have never been able to explain them to myself fully.

9609. Mr. Secombe last time in his evidence said, that discrepancies had happened some years ago, but that they had been corrected in later years; is that the case?—If it is the same discrepancies which I am speaking of, it is the discrepancies of the Statistical Abstract and the Calcutta Blue Books. If so, the discrepancies mostly relate to later years, and in the last one which I have (and which was published in 1870) from 1860 to 1869, those discrepancies have not been corrected.

9610. Those were as a matter of fact the books to which reference was made, and the discrepancies have continued up to 1870?—Yes.

9611. Will you mention some facts to illustrate the discrepancies?—It is a somewhat complicated statement, but I can put in a statement afterwards. For example, taking the statement for the accounts of 1855–56, the actuals are set down as having resulted in a surplus according to the London Blue Book of 1,603,118 £.; in the Calcutta Blue Book they are twice stated at 2,766,068 £. In another statement of the same series of Blue Books, with regard to the same set of figures, one statement of these Calcutta Blue Books shows part of the English figures net, the other shows both sides, both the expenditure and the income in England gross; so that in two ways it is exhibited. The statement entered in the Calcutta Blue Book is the statement which is entered in the Journals of the House of Commons.

9612. Sir Stafford Northcote.] May I ask if you have traced the cause of that discrepancy?—I have

have tried very hard to trace it, and I think that it is owing to the statements of the store accounts. I think that there is only a suspense account in which they are shown in one of the books, and I have found by verifying it, that the difference between the two in some of the years, would be reconciled by including the item of stores.

9613. Does not that, in fact, explain it, that the stores were reckoned twice over in the Indian expenditure, and also in the English expenditure, thereby making the gross expenditure apparently larger (I am speaking of the English book) by the amount of the stores than it is given in the Indian accounts?—That would be so, but the result is very different. The debt column should have a corresponding alteration; the columns of debt incurred, and of interest payable, would require to be reconciled also. I am unable to trace the things through, but I do not think that the columns correspond. The stores either were paid for, or they were not paid for at all. If they were paid for, they were paid for either out of debt or out of current income. The Calcutta and House of Commons Blue Books have omitted to charge for all the stores under current expenditure. The India Office Blue Book professes to charge for the stores under current expenditure. If the stores were not defrayed out of current income they were defrayed out of debt.

9614. There is no doubt of that inaccuracy, and that it prevailed to that extent up to the year ending 1866, at which time I had occasion to call the attention of the Indian Government and of Parliament to that discrepancy. Do you find any corresponding discrepancy in the last three years, that is, in the years ending 31st March 1867, 1868, and 1869 respectively?—I think not, and it was partly from that that I thought that was the cause of the discrepancy. But I fail to find the columns of capital account of debt and interest payable on debt to be reconcilable, so far as the Blue Books go.

9615. Mr. Grant Duff.] So that the mistake had been corrected three years before you had called attention to it?—I am not aware that it has been corrected, if the debt column and the interest payable column are not reconciled.

9616. Mr. Fawcett.] Are we to understand that from the books you cannot discover whether that has been corrected or not?—No; and I do not see what is the use of the House of Commons auditing and making out the result of one surplus, and then the thing being altered subsequently. As an accountant, I should say that it is a very grave matter to re-open an account which is supposed to have been fully audited by a competent authority.

9617. You are referring to the year 1865-66, are not you?—Yes.

9618. Can you tell the Committee exactly what took place in that year with regard to the correction of the accounts?—In the pamphlet which I have handed in I have given a statement of what took place, an abstract of proceedings in the House. Sir Stafford Northcote laid before the House the usual statement of income and expenditure, but he explained the accounts unsatisfactory with items, namely, (1.) some miscellaneous items, and then (2.) a mis-entry under stores, then (3.) a mis-entry under railway traffic receipts. He explained that those had not been entered as he would wish, but he asked the House to pass the accounts as they stood as showing a surplus of two

0.59.

millions odd, and the House passed the accounts as resulting in that surplus. I have looked up Hansard carefully to see whether the House of Commons had ever given specific authority to go back on the old accounts, and re-open the thing, and say that there was a less surplus, but I have not found any such proceeding.

9619. Then are we to understand that the House of Commons passed a resolution that there was surplus of 2,000,000 £, and that owing to the incorrectness of the accounts there really was not such a surplus?—It depends upon how the accounts may be stated, but I should say that if once the accounts are settled, it is a much graver matter to re-open old accounts, and that it is much better to let that stand, and carry the difference into the debt account.

9620. Sir Stafford Northcote.] Will you look at that volume (*handing it to the Witness*) of Hansard, and will you observe what the correction was that was made in the resolution that was passed. Does it not appear from that statement, that whereas the usual resolution had at first been proposed, stating that the income of India for that year was so much, and the expenditure, was so much, in consequence of the error having been noticed, the resolution was corrected on my motion, so that it stands, "it appears from the accounts before the House that it is so-and-so, thereby, putting on record that the House did not pledge itself to the accuracy of those returns?—Yes, that is the purport of the resolution here. Now what I tried to find in the subsequent parts of Hansard was to see whether this sanction, if provisional, was subsequently revised by the House of Commons. I have found no such thing, but on the other hand I do find that the Calcutta authorities treated the sanction as absolute sanction.

9621. Sanction of what?—Of the accounts as showing a surplus of 2,700,000 £.

9622. But the accounts of which we are speaking were simply laid before the House of Commons for information, and this Blue Book to which you refer is also laid before Parliament for information; what you point out is that both in those accounts, and in the Blue Books, the information on these points is not accurate; but there was no action taken upon that inaccurate information, was there?—Action is constantly being taken on a series of results, on the Exchange. For example, when people ordinarily imagined that there was a surplus of 2,700,000 £, proceeding on one statement; either the Calcutta Blue Book or the resolution as passed by the House of Commons, action was taken on it. Action must be held to be taken; when a surplus of that kind can be quoted; if there was no such quotation as of a surplus, confidence might possibly have been different in the money market.

9623. But as regards the financial administration of India, that is conducted in accordance with the figures which they have authoritatively before them in India, is it not?—Yes.

9624. And those statements have been cor-

that one should be held to, that the accounts should not be reopened, not only in 1865-66, but in previous years. For example, you have a surplus claimed for a particular year under Parliamentary audit, according to one set of Parliamentary Blue Books, and in another set

3 M

of

Mr.
J. Geddes.
7 July 1871.

Mr. J. Geddes. of Parliamentary Blue Books you have a deficit acknowledged for the very same year. In short, you have an irreconcilable discrepancy between two authoritative sets of Blue Books.

7 July 1871.

9625. But throughout those years up to the year when that correction was made, the same error vitiated the accounts that were presented in England; there is no doubt of that fact, and of course it is an error to be lamented; but looking to the public accounts of India, do you suppose that those errors affected the administration of the public revenue there?—Well, I imagine they would; I imagine that the Ministers would think differently, would administer differently and propose different expenditure if they realised the fact that they had normally a deficit, and that any one of their alleged surpluses was a mistaken surplus.

9626. Do you imagine that they took their figures from what was published in England, or from the accounts that they kept themselves?—I imagine that they took their own accounts; I do not know.

9627. Is there anything practical in this point except the remark upon an error having been in existence, which now is corrected?—Yes, apart from the difference as to the fact of financial failure, or the fact of financial success, there is this practical for the people who had to refer to the ordinary Blue Books, that there may be two sets of quotations as to the number of surpluses.

9628. Therefore these accounts ought to be in future corrected with a note to show that this error had occurred.

9629. Mr. *Lawcott*.] But these Calcutta Blue Books are not laid before Parliament, are they?—No, I think not; I have inquired very carefully for them.

9630. Mr. *Grant Duff*.] Do I rightly understand you to suppose that this English Blue Book to which you have referred is the authoritative document laid before Parliament with respect to the finances and revenue of India?—I imagine that it is one of those documents; it says "Statistical Abstract relating to British India from 1860 to 1869, as far as particulars can be stated, compiled from official records and presented to both Houses of Parliament by command of Her Majesty."

9631. Are you not aware that the authoritative documents are presented in the middle of the month of May in the shape of two Papers; one showing the Finance and Revenue Accounts of the Government of India in India, and the other the Home Account which relates to the expenditure at home?—Yes.

9632. Do you not understand that those are the authoritative documents from which and from a great number of other papers, this abstract has been compiled for more ready reference by a clerk at the India Office?—Yes, but this also professes to be presented to both Houses of Parliament.

9633. Mr. *Lawcott*.] You have some evidence, I believe, to give on the appropriation of revenue to income which you think ought to have been devoted to capital for the reduction of debt?—So far as I can ascertain, I do not think there ever was a surplus in India.

9634. Do you express that opinion after having gone into the accounts?—I have examined the accounts very carefully.

9635. And does that careful examination lead you to this conclusion, that in every year in

which there has been supposed to be a surplus, that surplus has been obtained by devoting revenue to income which ought to have been devoted to capital?—Yes, by devoting to income surpluses which ought to have been devoted to capital, or rather to minus capital, that is to say to debt.

9636. Will you give some facts to corroborate that opinion; taking two or three years?—Well, take the very last Budget which professes to show a surplus of, I think, 118,000*l.* on the ordinary expenditure; I should take exception to one of the receipt items of land revenue, namely, 875,000*l.* entered as sale receipts of waste lands. I imagine that these were the proceeds of sales made several years before; that during the intermediate years the proceeds of the sales had been kept in the Currency Department invested in Government Securities, and therefore to yield interest, and I suppose that in 1869–70, several years after the waste lands were sold, these securities were realised, and the proceeds carried to revenue; I say "I suppose," because it is very difficult from the published statements to obtain particulars.

9637. But was not there an Act passed in Lord Canning's time enacting that the proceeds of the sale of waste lands should be funded, and not devoted to income?—I forget whether there is an Act. There certainly was a Despatch from the Secretary of State incalculating the devotion of waste land proceeds to Government Securities, with a view to reduce debt absolutely or provisionally; I am not sure that there was an Act, or that it was put into legislative form. In any case it was the policy of the Government of India for some time to retain the sale proceeds of certain waste lands, especially of Eastern Bengal, in Government Securities.

9638. Are there any other items of revenue put down to income which ought not to be, in your opinion?—Let me explain myself more particularly; if my assumptions based on the Papers available to the public are correct, then you have an expenditure permanent, and very much on the increase, to be met in future by a revenue not only less in respect of capital, by the waste lands proceeds, but less in respect of interest by the income from the waste lands; an Exchequer with a certain source of revenue diminished has to meet an increasing expenditure. Then again, no land revenue would accrue from the waste lands so sold; so that one of the most important items of land revenue would thereby have been diminished. That is of no great importance except in principle, because these lands would not have yielded any land revenue worth speaking of.

9639. This year is there any other item put down to income besides this 875,000*l.* that you think ought to be put down to reducing debt?—I hear of a sum of 170,000*l.*, and I think it was specified in Sir Richard Temple's Budget, "Holkar's tribute capitalised"; I have no further knowledge on that subject, but on the very statement of the item it seems to me abnormal. A third item is Police Superannuation Fund excess, 298,000*l.* A fourth item is the recovery on Abyssinian advances of 330,000*l.* Then there would be, *per contra*, in the expenditure side, a saving which had been obtained by a sudden stopping of public works in September 1869. A budget containing all these mis-entries of credit and

and debit would, I think, not be an accurate, business-like statement of the financial proceedings of the year.

9640. Then your supposition would be that there had been a deficiency, adding up the figures which you have given, of something like 1,000,000?—I did not add them up, because I could not get the whole information. It is useless to attempt to state how I should say that the year ought to have ended; of course I have not the means of doing that. Only, it is certain that whereas a slight surplus was claimed, a heavy deficit ought to have been acknowledged for last year (1869-70).

9641. But referring to any previous years that you like to take, as you have expressed the opinion that there never has been a surplus, take any year which you like that you have investigated, and please mention to the Committee the facts on which you base the opinion that the surplus really ought to have been stated as a deficiency?—In the pamphlet which I have put in I give an examination of all the surpluses, and I think there are 11 of them. At page 8 of my pamphlet I say, "It will be seen that before the mutiny of 1867 there were only two interludes free from confessed financial disaster, the one from 1834-35 to 1837-38, under Lord William Bentinck, and the other from 1849-50 to 1852-53, under Lord Dalhousie. Since the mutiny there have been only three such years. Altogether the Indian Exchequer claims to have paid its way, to have achieved a surplus, and to have sometimes even paid off debt in 11 out of the 35 years, 1834 to 1869. Deficits, often stupendous in amount, are confessed for the remaining years. Indian credit reposes largely on these 11 years of alleged surplus, and on confused traditions of similar interludes of success in the antecedent periods of the trade monopolies." I had previously stated there that it was impossible to deal with those surpluses in which mercantile and Government accounts were mixed up. The list of them is rather long.

9642. Will you select any year in which there was a surplus, and give the figures?—Take the year 1863-64. The year 1863-64 purports to show a surplus of 78,347 £. Mr. Massey, and to some extent also, Mr. Strachey, in their remarks above cited, decline to admit the name of a surplus to a figure so trifling in comparison with the large amounts under balance. More substantial and indeed fatal objections must be made to such inadmissible items as the following, which are miscredited to the revenue instead of to the capital, i. e., the debt account."

Accounts.	Major Heading.	Minor Heading.	Amount.
Home	Miscellaneous, Civil	Proceeds of Sale of Property, Stores, &c.	£. 125,021
	Military	Amount received from the War Office on account Depot and Recruiting Charges of H.M.'s Regiments serving in India for the Years 1863-66 to 1866-61, and the Amount of Proceeds of Sale of Unserviceable Military Stores	213,434
Indian	Land Revenue	Sale Proceeds of Khas Mehals	389,880
	Miscellaneous		700,000
			1,100,000

These items, erroneously treated as revenue, more than exhausted the surplus of 78,347 £. claimed in 1869.

the Calcutta-Blue Book. There is one matter about the financial outcome of the year 1863-64 which I should like to notice in connection with what I said a little ago about the discrepancies in official returns. The Calcutta Blue Book and the House of Commons Journal record a surplus of 78,347 £., not a very large amount, but still a surplus. The India Office-Blue Book, or Parliamentary Statistical Abstract, admits a deficit of 368,974 £. for this very same year 1863-64.

9643. But could you briefly state, in order to give the Committee an opportunity of cross-examining you, the items in any one year which have been put down as income, and which you think ought to have been devoted to diminishing the debt, the result of which has been that where there appears to be a surplus there really is a deficiency?—I have said this, "It is true that a surplus of income over expenditure, with sometimes a partial reduction of debt, has been claimed on one or two rare occasions in Anglo-Indian history; but those assertions of surplus will be found on examination to be, like Pyrrhic victories, more discouraging than disaster itself. Indian financiers have never succeeded in claiming a surplus or equilibrium, except when they have been permitted to defer payment of accrued charges, or to treat as recurring income available for expenditure forestalments of future revenue, unexpended portions of former loans, sale proceeds of stores, ships, &c., which had been purchased out of debt in antecedent years of deficit." I speak of surplus and deficit as a very different matter in connection with a foreign-held dominion from deficit or surplus in connection with any European native Government.

9644. But I want to get at this: can you, in any one year, mention an item which had been put down to income, which ought to have been put down to capital, for instance, the sale of the waste lands or khas mehals, so that the Committee might judge whether your opinion is correct?—In 1862-63, for example, the sale proceeds of khas mehals were 172,900 £. Then miscellaneous receipts, in all amounting to 1,329,945 £. They represent chiefly sale proceeds of buildings, ships, and stores, sums which I should say ought to have been placed to credit of their corresponding debits. I should say that the sale proceeds of those should be carried to the reduction of that debt, without which the originals would not have been provided.

9645. Was there anything else in that year besides those two items to which the same would apply?—The opium revenue was abnormally large in that year. Then there were some other things, like the salt revenue, the salt revenue, evidently, I should say, an item of some other year carried to a different year from that in which the duty would properly be held to have accrued.

9646. You think it was not from an increase of the revenue from salt?—It was a large stock of salt purchased by natives on the rumour that the salt duty was about to be raised. A very large sum was realised in one year in that way.

9647. It would probably be followed by a deficiency in the following year?—Yes, and the expenditure of the following year would have to be met in full with this item withdrawn.

9648. You wish to convey to the Committee that the sale of these khas mehals was really the sale of Government property that ought to have been put down to the diminution of debt, and that

Mr.
J. Geddes.
7 July 1871.

Mr.
J. Geddes.
7 July 1871.

these miscellaneous receipts represent the sale of stores and ships and things which had been partly furnished with borrowed money, and therefore ought to have been appropriated to the diminution of debt?—Yes, the sale proceeds of a khas mehal representing the capitalised amount of a certain existing annuity and a certain potential annuity for the Government.

9649. You have looked into the subject of the small amount of the debt, which is held by the natives as compared with the English, have you not?—Yes, I think 91 per cent. of all the liabilities of every kind are held by Englishmen, and I think 9 per cent. by natives.

9650. You make a distinction between the moral obligation which England imposes upon herself with regard to those loans which are called Parliamentary loans and those which are not, do you not?—I imagine that all the Indian loans are Parliamentary loans.

9651. But there are certain loans, are there not, raised under the distinct authority of Parliament?—Yes, for example, East India Stock, which represents the trading capital of the old East India Company. That has a greater prerogative than other debt of the Indian Government. But I imagine that the whole of the debt is practically on the same footing now, because I believe an Act was lately passed indemnifying trustees who should invest in any Indian Loan brought out subsequent to the date of the Act. It would be difficult to distinguish between the different positions of the same set of liabilities or to priority of claim.

9652. Is there any other subject to which you wish to refer?—I was asked by Mr. Grant Duff whether the error that I had pointed out had not been corrected some years before; I did not understand the question at the time, but what I should have answered was that I was not aware that the discrepancies had been reconciled. The statements which I criticised bore the date both of them of 1870, both emanating from substantially the same Government.

9653. Mr. Grant Duff.] I think you are a servant of the Indian Government, are you not?—Yes.

9654. What was your position when you left India?—I was official collector of Pooree, the southern portion of Orissa.

9655. That is a position of some responsibility; is it not?—Yes.

9657. Do you consider that it is any part of the duty of a servant of the Government to be in harmony with the general spirit of the Government that he serves?—Certainly, if there is a single harmonious spirit throughout the Government.

9658. You take by no means a very hopeful view of our connection with India?—No, I do not; I take a very gloomy view indeed.

9659. You have said, I think, in reply to the honourable Member for Brighton, that if we cannot administer cheaply we should withdraw from India?—I spoke of the future; if we cannot administer in the future more cheaply having to face a constantly increasing expenditure.

9660. And is it your opinion that henceforth England must address herself strenuously and of set purpose, not in their vague talk as heretofore, to the stupendous and exhausting task of reconstructing native governments all with a view to a speedy and peaceful liquidation of her Indian concerns?—Yes; as speedy as possible, and cer-

tainly peaceful; necessarily to a large extent at the cost of England.

9661. And you think that statesmen "should betake themselves in earnest to real preparation against the collapse of the Indian dominion"?—Yes.

9662. You further think that "our present Government in India" which you serve, "is far from being that good and fine thing which it is generally believed to be," do you not?—Yes.

9663. You consider that "our present administration of India is a failure in temporal matters," do you not?—What do you mean when you say, "in temporal matters," may I ask?

9664. I quote from a pamphlet by Mr. James Geddes: "Our present administration of India is a failure in temporal matters. For it is impoverishing the people."—Yes. I wished to make sure that the sense of "temporal" was the one in which I meant it.

9665. You further consider that "in matters of immeasurably greater concern it is worse than a failure, for it not only lacks competent Spiritual direction of its own, but it is unhappily breaking down the residuum of the indigenous Spiritual Powers, Brahminism, Buddhism and Islam"?—Yes, I think that a western power impinging upon an Oriental society, of necessity breaks down the Spiritual fabric of Asiatic society; I think that will be a great evil.

9666. You further consider "the aspiration of our Government in India," is "to administer society through only the temporal without the Spiritual Power," do you not?—Yes, that is so.

9667. And you have illustrated that I think, by saying, "of which a Londoner may attain some partial but inadequate idea, if he will think of a current nostrum of policing baby farming efficaciously by registration and what not; all, forsooth, because here the Spiritual Power in these latter days has little courage and less power to enforce chastity"?—Yes; I speak of our Government in India, which I say has insufficient resources, is unable from its very position to appeal sufficiently to the native religious feelings, without which I think a Government cannot be carried on well.

9668. And you compare the Government of England in India, to form part of which you are returning, to the Government of "a few Chinese mandarins, who had begun late in life to acquire pigeon English"?—Well, to a Londoner it is so generally speaking. Of course I wished to put clearly my view, and it is difficult to put the thing clearly, except by stating it in some such form.

9669. That is not an unfair representation of your general view of the English Government in India?—I have thought since then that I overestimated the desirability of putting forth different ideas from those generally and erroneously accepted in London. I do not think that I should put it in that way now, or so strongly. For example, I think that our knowledge of the vernaculars is greater than an ordinary Englishman would suppose from my sentence there.

9670. But do you still consider that "the incurable defect of Anglo-Indian rule," is the lack of Spiritual governance?—Yes, the lack of Spiritual governance as working through native religious institutions.

9671. Do

9671. Do you still consider that "the aggressiveness of the Catholic Christianity of Spain in the Western Indies is paralleled by the intolerance of Protestant Christianity in the Eastern Indies"?—I do. I indicated generally there the reasons for making that statement. You will see that in the announced continuation of Part I., I had proposed to set forth my views generally, giving authorities in the sequel.

9672. And you believe that the English dominion in India is a great wrong to the English working classes?—I do, a great wrong.

9673. And you believe that what you do describe as "Sahabdom," which I suppose is the English administration in India, "has more to fear from Sociologists in England than from Wahabis in India"?—Yes, I think that in case of any trouble in India, another mutiny, the difficulty of raising money in the face, say, of a Gambetta, determined not to have this any longer, that would be a more serious difficulty than anything that the Mahomedans can at any time array against us.

9674. May I ask you if the following sentences express your mature opinion with regard to the relations between India and the English working class: "They would be better off if the English capital, which in enormous sums every year is drained away to India, and thus aggravates the exhaustion of India by further levy of tribute for interest payment from overworked or disheartened starvelings, aggravates the degradation of England by the further luxurious consumption of rentiers idle or retired into idleness, were applied reproductively in this country. The English workmen have begun to struggle for their interests as class interests, in a new kind of class devotion transcending the old territorial patriotism?"—Just let me say about that expression, "overworked or disheartened starvelings," that I use that as correctly describing the position of a great many of the India people, not all.

9675. But are those sentences that I have read a fair description of the Government of India, in its relation to the inferior classes of India, on the one hand, and to the working classes of England on the other hand?—That is so; it is my matured opinion. I wish you, however, to understand that I am describing there the condition of a portion of the Indian people; you would gather of course from my previous evidence, that I did not mean it to refer to all; I spoke, for example, of tenures in Bengal in a very different condition.

9676. Do the following words still express your opinion. "In this spirit the English labour leagues will, sooner or later, bring English capital to bay within the four seas, and, in the impending conflicts, will refuse any change of venue to India, or to the colonies, or to elsewhere beyond their reach. They will put not only in argument, but in action, the maximum that 'riches are social in origin, and should be social in destination'?"—Yes, I am describing there what I believe to be part of the inevitable course of English politics towards India. I am expressing there my opinion as regards the tendencies of the future.

9677. And you think that what is wanted for the good of India is a committee of public safety, and not what you describe as "an Alice in Wonderland Jury at St. Stephen's"?—Yes, I have said that I think that it is necessary to have a committee which will take some definite action.

9678. Mr. Cave.] I did not quite understand

your theory about the land being impoverished by the cost of transport of produce to a distant government, will you explain that further?—You would have a similar thing, in what Judge Longfield describes under the tannures in Ireland, in the Cobden Club volume. He speaks there of absenteeism, of the absentee landlords having to receive their rent in another country, as being an aggravation to a people who have only agricultural produce with which to make good the demands against them, and having to bear the cost of transporting these to a distant place.

9679. But is not the produce of land in India, that is to say, the value of the agricultural produce, expended in India?—No; large sums are certainly not expended in India; large sums are obviously expended in London.

9680. What sums do you refer to?—The Home Charges.

9681. Those are very small, are they not, compared with the whole expenditure in India; they amount, I think, to 12 or 13 millions?—I think that is a large sum for native industry to maintain at such a distance; 13 millions is the amount given by the Duke of Argyll in a despatch on irrigation works.

9682. At the same time a very large sum is spent from England in India upon works?—Yes, that is so. There is a very great difference, however, between the two. What the Hindoos have to part with, they part with absolutely; what they get on public works they do not get absolutely, but on loan, and they have to pay interest on it. Not only so, but the classes who send home to England the agricultural produce, from which the home charges have to be defrayed, are not the same classes to whom the influx of railway and other money comes; the influx of railway money is local while the taxation is general.

9683. Is it not the fact that railways and other public works have increased wages all over India?—Not all over India.

9684. Over a large extent of India?—In a recent Budget Statement of Lord Lawrence's, about 1866 or 1867, he particularly describes what is generally known in India, that the rise of wages is mostly near the railways; there has been a general rise of wages throughout India also, but that is not a measure of prosperity to a great extent, but it is largely due to the enhanced price of food.

9685. But has not that rise in wages throughout India been caused by the greater comparative wealth of India in consequence of increased trade and of public works?—Partly, of course, it is. In any parts of India, whenever there have been large public works, the wages have risen very materially; you cannot throw any large sum of money into a population not very far advanced without dislocating all the current rates. It does not follow that the high rates of wages will continue. For example, it is only a year or two ago since after the large sums which were no longer spent in the Central Provinces, or after such large sums as had been spent in the Central Provinces were no longer spent, the Central Provinces which are ordinarily supposed to be very flourishing were troubled with famine. The Chief Commissioner, Mr. Morris, remarks on this in the Statement of the Moral and Material Progress and Condition of India for the year 1868-69, and he there mentions one of the things which I alluded to, in

Mr.
J. Geddes.
7 July 1871.

Mr.
J. Geddes.
July 1871.

answer to a question of Mr. Grant Duff's, the different spirit which may prevail in native society owing to our rule, or under our rule, as Mr. Morris would put it. He describes there generally how the rich people formerly would have done their duty better to the poorer natives, and that there has been less of this of late years.

9686. But do you mean to state that wages have diminished in the Central Provinces lately?—I do not know; I imagine that they have. I have not served in the Central Provinces; I merely know the general fact that a great many people have died.

9687. You have stated that wages have increased generally all over India, which is usually an indication of prosperity, but you say that now expenditure has been diminished in the Central Provinces, and I understood you to infer from that that wages have diminished?—I say, that the rate of wages has diminished, at any rate, by what you could assess it at for a day's labour; after the Jubbulpore Railway was finished I fancy that coolies could be hired cheaper for the day.

9688. Do you know as a fact that the wages have diminished in the Central Provinces?—No, I have not personal knowledge of the Central Provinces.

9689. You stated that one of the effects of the expenditure of the Government drawn from the taxation of the country has been to extend cultivation. You stated that cattle were worked more than they had been before, and that pasture lands had been broken up and turned into arable to increase the export of produce which was necessary?—Yes, in the preceding statements, I am proceeding very largely on official publications, as well as on my own personal observation.

9690. Supposing that is so, is not that the greatest indication of prosperity that you can possibly have in a country?—Not if the people have not enough to feed on. If the people die, the word "prosperity" as regards them terminates. I imagine.

9691. Is it the fact that in these countries where cultivation has increased the people die?—In many places; in our re-settlement of Orissa, for example, or any other province, you would find an increase of cultivation with an increased population. It does not follow from an increased cultivation that the people are better off. The area of cultivation may be extended, but it does not follow that the people are better off, possibly there may have been people to eat the produce, and certainly a greater proportion than formerly, of the surplus receipts has to be sent off to London.

9692. You stated that in this particular place cultivation had extended; and that the export of produce was greater; that, in fact, the cultivation had extended for the purpose of maintaining that export; well then, does not that mean that the people had as much to eat as they had before, and money besides, in return for selling the rest?—No, it does not necessarily; they might have to give out as fast as they gained. If taxation swallowed up a considerable proportion of their produce, it does not necessarily follow that they would be better off. If there were no taxation they would be better off, but it does not follow that under taxation they would be better off. I cannot say how far taxation is the cause in any one case; or how far in general taxation is the cause of greater hardship in life; I speak of it as one of the causes.

9693. I do not understand how it is possible that, if cultivation has extended and part of the produce is exported, the country can fail to be richer than it was before, when the whole produce was consumed upon the land?—If the cultivators in India export oil seeds to England, the proceeds of which go to fatten bullocks for the London market and to lubricate English machinery, it does not follow that those cultivators will be better off. They select a crop which will bear carrying over a far distance. For example, they would not propose to offer market-garden produce, which would perish on the way; they are at a disadvantage then necessarily in the very fact of being required to export.

9694. Does not the money that comes from this export of seeds go into the hands, in the first instance, of the ryots who grow them?—And much of that has to be parted with again immediately. For example, to take a well-known staple, the monies advanced, in Behar for the earnest hire of cultivation of opium return almost immediately from the ryots, through the zemindars, in the shape of land-tax payments into the Government Treasuries throughout the province. That is a system of truck which does not enrich the people.

9695. The cultivator, at any rate, lives on the crop, and the rest goes to the revenue of the country?—If he has to pay much of the money as fast as he gets it into the Treasury, it does not follow that he is better off.

9696. He is not obliged to grow opium, but may grow corn if he pleases, may he not?—He may grow corn if he pleases, if he finds a man to make him the necessary loan or advance.

9697. Does not he choose opium because it is the most profitable crop?—It is the most profitable crop, but the greater part of the profits goes elsewhere than to the ryots.

9698. Does not he get for growing opium a larger portion of the profit to himself than he would get if he grew corn?—Obviously he does, or he would grow corn; but it does not follow that he would not be better off if the taxes to which he himself contributed were not applied to rearing opium.

9699. Of course he would be better off if he had no taxes to pay, and so would everybody, but you seemed to say that it was a bad thing for the country that opium was grown instead of corn; now you say, do you not, that the country is richer in consequence of the growth of opium instead of the growth of corn?—Ryot by ryot carries on the struggle of life for a time better; it does not follow that the country at large is better, nor does it follow that that particular ryot would not have been better off if the Government could afford to do without the opium business altogether, if the opium were left entirely free, if there were no element of compulsion anywhere in any part of the opium arrangements, that is to say, if the opium business were not a part of the political system.

9700. How does that affect the cultivator?—You have 200,000 bayonets enforcing payment of taxes, part of which are devoted to growing opium, and I speak of that as involving compulsion. What I generally take exception to is the theory under which every ryot is presumed to be a free agent in every matter.

9701. But you said that the ryot was perfectly free to grow corn instead of growing opium, therefore

Mr.
J. Geddes.

7 July 1871.

therefore 200,000 bayonets would not have any effect in making him grow opium instead of corn?—They would not be applied, particularly to him; but the revenues are obviously raised with force, if necessary, to secure them, and part of the proceeds are devoted towards the opium speculation.

9702. I do not see what that has to do with the ryot growing opium instead of corn; he does it because he gets more profit out of it than any other crop, and he chooses the crop for that reason, does he not?—You speak of the ryot from season to season; I speak of the condition of society from generation to generation.

9703. I do not go so far as that. Take the ryot as one portion of the ingredients of the country; and if it suits a ryot to grow a particular crop, and he is left free to do it, I do not see how compulsion operates?—That, of course, involves the very meaning of "freedom."

9704. I do not understand in what way he is not free. He has taxes to pay out of this crop; so has everybody; but in what sense is he not free?—I may explain generally that the ordinary theories of political economy under which every question of that sort is generally viewed seem to me to be erroneous in assuming that every human being is a separate atom, and also that every separate atom enjoys complete spontaneity. I am of opinion that there is compulsion everywhere in any and every government.

9705. Is it not the best thing for a country that everybody should grow in it the crop which the soil suits best, and from which the largest profit is obtained, and that the surplus of that should go to buy elsewhere what some other soil grows best?—Certainly.

9706. Is not that exactly what is done in the Malwa district, when opium is substituted for cereals?—Do you speak of the advantage to the ryot in Malwa, or of the advantage to society generally?

9707. I am speaking of the advantage to the people who grow the opium?—Obviously the fact of their growing opium shows that they consider it in their particular season more profitable. Whether the political agency under which all this is done, which reaches from China to the Atlantic Ocean, is enriching the country in that process is a question on which I hold a different opinion.

9708. But we must come back to the narrower question of growing opium instead of cereals, which you seemed to think was a bad thing to the country in which it was grown?—In the severe famine of 1866, I imagine that the people in Behar would have been better off, supposing that the condition of society had been different, and the entire political arrangements different. The shortness of the monsoon would have been got over sooner if the acreage which was under opium in that year had happened to be yielding wheat.

9709. But was not the famine caused by the season being so bad that nothing grew at all?—No; the cultivators would have had a reserve from the previous year's growth in wheat.

9710. How would you have had a reserve if you only grew enough to support the people?—The natives themselves certainly would have. One of their chief customs, one of the customs of the old conservative native, is to have stores of food against a bad year.

059.

9711. And you think that it is better to have the whole country growing corn, and to have stores of food in case a famine should come once in a cycle of years, rather than to grow opium and sell the surplus, and buy what is wanted?—I would agree with the old conservative native that a surplus set aside for sale should be only such as should remain after putting aside enough to provide for the vicissitudes of the following season.

9712. You stated, that in case the natives were left to themselves they would stop drunkenness and the consumption of opium by putting those who offended out of caste?—They certainly would throw themselves upon that.

9713. Is there anything to prevent their doing that now?—They can do so now; but they have greater difficulty in fastening upon the people through whom it is done. In a native condition of society, and under a native rajah, the brahmins would sit *dharma* at the gate of the rajah if he did not give up growing opium, or they would put out of caste any man who sold opium. It is not easy to put opium vendors out of caste when they form part of the government machinery. It is less easy to enforce the caste system in a society administered by a foreign power which itself does not acknowledge that caste system.

9714. *Chairman.* Would they not always put him into caste again if he paid a sufficient sum of money; do you not know that a person who is not one of the exalted caste if he weighs himself against gold, and gives weight enough, is made a brahmin?—Yes; and that fact is of the same importance as the fact that a rich man can do great many things in this country which a poor man cannot. That the spiritual authority is incomplete is true, and that the spiritual authority does great things is also true.

9715. *Mr. Cave.* There is nothing in our law to prevent the spiritual authority being exercised itself, is there?—If the spiritual authority threw itself upon the vendors, and found among them the masters of 200,000 bayonets, they would not be equally able to enforce their religion.

9716. We should not interfere in any way by means of the bayonets, should we?—If the Wahabis declared a crescentade you would interfere. If the brahmins thought it necessary to throw themselves upon the vendors of opium all over the country, you would interfere then.

9717. To keep the peace, you mean?—Yes.

9718. *Chairman.* Do you recollect whether a very considerable number of the Mahomedan kings in the Deccan and in the central parts of India did not die of excessive drinking, whether that was a common end of their career?—That is not the out-come of the Mahomedan history, so far as I remember it.

9719. *Mr. Cave.* I did not quite understand what you stated about the buildings in India, temples and other famous structures being an evidence of the people having been lightly taxed in former days?—My general experience is that I do not see any amount of temple building equal to keeping up the existing set of temples. There is not an amount of repair equal to the wear and tear of the existing temples.

9720. Is it not generally supposed that all those magnificent buildings, not only in India, but in Egypt and elsewhere, were constructed by the forced labour of slaves?—Yes, by forced labour; but under a system that was largely consonant with the ideas of the native society at the time.

8 M 4

9721. Was

Mr. J. Geddes. 7 July 1871. 9721. Was it not a system in which there was one despot who disposed of the lives and liberties of all his subjects as he liked, and, amongst other things, obliged them to build these temples?—That might be a very good thing indeed.

9722. *Chairman.* Do you think that with regard to the period, before the British Government existed in India, it would be right to say that the native governments took from the people the largest possible share of the produce of their land that they could get?—No, I think not; I think that all our early historians exaggerate the extent of disorder in India; that they exaggerate the break down of native society. I question whether a native now would not estimate that there was a considerable set-off against what we think our better administration, say, in the condition of our police.

9723. But as a matter of fact, do you think that speaking of the time when the British Government was established (I am not going back to the supposed golden age of India) it was then the practice of the native rulers, such as then existed, to take as much of the produce as they could get from the cultivators and occupiers of the soil?—No; I should not accept that as the condition of society at that time. I should hesitate to fasten an indictment against a whole government in that way.

9724. I am speaking generally; there may be exceptions; but do you think that that was as a rule the general character of the state of affairs in India at that time?—I do think that the governments at that time were in a course of anarchy and considerable anarchy.

9725. And they were in the habit therefore of getting as much as they could from the occupiers of the land; there may have been those here and there who restrained themselves within much narrower limits; but that was the rule?—No, I should demur to that; that would imply that the governors looked upon themselves as in chronic hostility to their subjects; that was not the condition of things.

9726. What do you think was the limit which they put to their demands upon the inhabitants generally?—If you mean the central power, the central power is naturally limited by the ideas which the local powers have.

9727. I mean those who had the power of taking?—They were not purely arbitrary powers; they were limited by the spiritual ideas existing at the time, by the opinion of the priests, by the opinion of the current ideas of society, by the general idea which natives call the use and wont.

9728. Have you any idea what they considered as a rule to limit the demand which they made in quantity?—I do not know of any measure by which to measure it.

9729. Could you suggest in any set of provinces, or throughout any part of India, what was considered the limit of the demand that might be taken by the Government and its officers, individually and collectively, from the occupiers of the soil?—In what form assessed; do you mean in money?

9730. Either in kind or in money, and taken either by the superior or by the inferior authority, and all the agents put together?—I know no numerical measure by which to tabulate the proportional taxation of the native and the English administration respectively.

9731. What do you think was the general application of what they took; was it for any purposes that benefited the inhabitants, or was it for the purpose of maintaining a very large number of persons in idleness, and persons who would come under the common name of followers, irregular troops, and persons of that sort?—That was so. Those followers might be doing good service, say, in guarding the frontiers, and they might do it more cheaply than English soldiers who require to have their beer sent out to them all the way from England.

9732. I ask not what they might do, but what they were doing then; were they rendering any service to society, or marauding and plundering upon their immediate neighbours?—They were rendering services to their immediate neighbours, and often they were marauding and plundering; it is impossible to give a precise answer to such a question.

9733. As a general proposition, was not the money so received spent in maintaining large bodies of retainers, followers, and so forth, who did nothing?—No; I should demur to that. I should demur to countersign such an indictment against any portion of past history; any government which was so uniformly in the wrong could not have continued.

9734. That is not exactly the question; I am asking you for a general view of the state of things?—You put the question, does this represent your opinion of what took place under the native government, and I am saying that an answer, yes or no, would not represent the true state of things.

9735. What did they do in any way for the people with the money that they received except keeping up retainers?—Taking a condition of society in which you had a Menu formulating precepts for society, or a condition of society in which you had buildings like the Musjids at Delhi, I think there were many creditable things in such a society.

9736. Do you think that those were going on at the time the British Government was established in India?—I think there was more original thought among the natives before the English came among them.

9737. I was speaking of the time when the British Government was established?—I think so; I think there was a large measure of prosperity in the country at the time; all our early travels which we read indicate a large measure of prosperity.

9738. Do you know whether whole districts had been depopulated then by their marauding violence?—There was a great deal of marauding violence just as there were English invasions of France in the Middle Ages; but I should hesitate to say that Europe was uniformly marauded during the Middle Ages. I think I remember Shore describing the Chandani Chaul at Delhi under native government 200 years ago, as being certainly far finer than any street in London. Many of his views coincide with much that I express.

9739. Have you considered at all what has been the increase of the annual productive wealth of India since the period of the establishment of British rule, taking it at the beginning of the century?—I have done so very carefully. I have gone over, for example, the tables of exports and imports with the utmost care; those are obviously among the best indexes of the condition of the people. I have examined them most carefully.

I am

I am unable to separate them so as to see how far the increasing exports are due to annexations. I have therefore a difficulty in saying how far the prosperity has been due to English administration.

9740. I am asking you whether you have considered the increase of the annual productive wealth of India at the present time as compared with the productive wealth at the beginning of this century?—I imagine that it is more productive. By "wealth," you mean, I suppose, capital; the accumulated proceeds of former labour.

9741. No; I mean wealth in the proper sense of the term, everything produced in the year?—I think it has increased. I think the rate of interest, for example, is normally falling.

9742. It would prove, therefore, that the people produced enough for their subsistence, and something more to save in the year, would it not?—I should say that the fall in the rate of interest is only a matter which I speak to from my own personal observation in a very limited, and that too an exceptional, sphere.

9743. You know, at the beginning of the century, the ordinary rate of interest was 9 per cent. for money in deposit at a banker's?—No ordinary native could have got money at the beginning of the century for 9 per cent.

9744. He would have paid a great deal more, but the interest allowed by a banker on deposit would have been about 9 per cent. would it not?—The English rate of interest was probably about 9 per cent., and that was the rate of securities in 1808 and 1811. Henry St. George Tucker speaks of that as being the rate of interest at the beginning of the century.

9745. I asked, did not a person get 9 per cent. interest for depositing money with a bank at the beginning of this century in India, an English bank, I mean?—I should have thought he would have got more.

9746. If he deposited money with a native banker, he would have been sure to have got about 12 per cent. at the beginning of the century, would he not?—I do not think that native bankers are fond of giving interest to Europeans.

9747. I am speaking more of operations between natives; if a native deposited his money with a native banker at the beginning of the century he would probably have got 12 per cent.?—I do not think so; I have no means of judging.

9748. Do you happen to know at what rate bankers were in the habit of lending money at the

beginning of the present century; would it be too much to say that they lent it at the rate of $1\frac{1}{4}$ or 2 per cent. a month?—There is no means of tabulating accurately the rates of interest either then or now; I have tabulated the English rates of interest.

9749. Do you think we should speak within the mark if we say that now it is half what it was at the beginning of the century?—No; I do not think it has fallen nearly a half.

9750. How much do you think it has fallen?—I have no means of saying. When I spoke of normally falling, I carefully said, that I spoke of my own observation; I am unable to tell you how far it is temporary, and due to an exceptional influx of money. For example, in Orissa, in which I chiefly made inquiries, the Irrigation Company, I suppose, put money into the country available for some of the Mahajans, and the rate of interest became rather lower.

9751. That would prove that the community was thriving and accumulating every year out of its produce?—No; it would show that some classes were being made rich by the irrigation money; it does not follow that the rest of the community were. It was not the same part of the community which got the imported money which had also to bear the interest charge.

9752. But money would not be imported into the country, unless it was accumulated in some form or other in the country, and represented some kind of produce in the country?—Yes; for example, you have 311,000,000 *l.* supposed to be hoarded in the century.

9753. That would tend to prove that there was money available for investment, and besides that a great deal of money accumulated, which they did not want to invest, because they were so well off?—I should not draw that conclusion; the sum supposed to have been absorbed by India I think was 311,000,000 *l.* sterling excess of imports over exports of bullion; that is, from 1800 to 1867.

9754. It would assume, I say, that they have arrived at such an improved condition that they have now capital to lend amongst themselves, some classes or other, and that they have more than 100,000,000 *l.* of capital that they do not even care to lend at a rate of interest?—No; because if you take 311,000,000 *l.* and distribute it over 202,000,000 of people, you will find that it is an importation of rather less than 6 *d.* per person every year, or 1 *l.* 12 *s.* 7 *d.* per person for the whole 67 years.

Mr.
J. Geddes.
7 July 1871.

Tuesday, 11th July 1871.

MEMBERS PRESENT:

Mr. Ayrton.
Sir Thomas Bazley.
Mr. Bench.
Mr. Birley.
Mr. Candlish.
Mr. Cave.
Mr. Crawford.
Mr. Beckett Denison.
Mr. Grant Duff.

Mr. Eastwick.
Mr. Fawcett.
Mr. Robert Fowler.
Mr. Lyttelton.
Mr. McClure.
Sir Stafford Northcote.
Sir David Wedderburn.
Sir Charles Wingfield.

THE RIGHT HONOURABLE ACTON SMEE AYRTON, IN THE CHAIR.

Mr. JAMES GEDDIS, called in; and further Examined.

Mr.
J. Geddis
—
11 July
1871.

9755. *Chairman.*] Do you wish to make any statement with reference to the answers which you gave on the last occasion?—Yes, with reference to several of the answers that I gave on Friday. Owing to the length of the examination I stated some things incompletely, and one or two things I stated erroneously, and I wish to have an opportunity of supplementing some and of completing the evidence in others. In answer to Questions 9497 and 9498 I spoke of the earlier famines of the last century as compared with the later famines of the present century. Since Friday I have verified the figures which I quoted on that day, and I now wish to put in a complete statement of the figures (*Vide Appendix, Paper I.*); I shall be very glad to have an opportunity of being examined further on those questions, having since Friday revised all my notes on the whole question of the famines. I shall also put in statements from several high officials concerning native opinion on the growing hardship of life (*Vide Appendix, Paper II.*).

9756. First, with reference to the famine of 1770, what more have you to say?—I shall put in the financial and other statistics of the famines of 1770, 1860, and 1866 to admit of comparison (*Vide Appendix, Paper I.*).

9757. Will you state the principal facts embraced in the Return?—In the three sets of years I show (1) the population concerned, or supposed to have been concerned; (2) the amount of revenue remitted by Government; (3) the amount spent in relief by Government, and (4) the statistics, as far as tabulated, of the mortality.

9758. Will you read those to the Committee shortly?—They are mostly verifications of my last day's figures. Shortly, they stand thus: Dr. Hunter makes out that the famine of 1770 was very much more severe and ranged over a very much wider country than the famine of 1866. But that that was not so will appear from the statements of revenue remitted in both the years. There is this dilemma: Warren Hastings must either be convicted of inhumanity towards the

people, or, on the other hand, he may be admitted to be inaccurate as to one of his figures, and that a casual one.

9759. Do you consider that a necessary consequence of the facts?—I do.

9760. Do you suppose that if there was no food in the country for the people to eat it would constitute inhumanity on the part of Warren Hastings if he could not get them the food?—In answer to that question I should like to enter into the grounds upon which I make my statement.

9761. *Sir C. Wingfield.*] Are you referring only to the sums remitted or to the sums actually disbursed by the Government in relieving the famine?—Both. In the first place, as to the famine of 1770, it is a moot question still among Indian officials as to whether the famine was caused by drought or by rain, so little is known of the famine of 1770.

9762. *Chairman.*] But if the fact was so, that there was no food in the country, and that 10,000,000 of people died of starvation because they had nothing to eat, Government could not be charged with inhumanity unless it had the means of giving them the food, could it?—The Government being aware of the short crops in 1769, having very complete information, as Dr. Hunter shows, on the state of facts existing at that time, added 10 per cent. to the revenue demand for the following year. It would have been inhumanity to have added a demand of 10 per cent. to the main taxation had the disaster been so very great as was at all likely to cut off anything like a third of the population. I should say that Warren Hastings transferred the figures of the mortality of one district in a general way to an area which he calls the province; that district, as will appear from Dr. Hunter's statement, may have been Purneah. Warren Hastings speaks of the mortality of the province as having amounted to a third of the population, which seems an incredible statement in the body of the Reports as to the amount of revenue collected.

lected. Dr. Hunter says, "In a year when 35 per cent. of the whole population, and 50 per cent. of the cultivators perished, not 5 per cent. of the land tax was remitted, and 10 per cent. was added to it for the ensuing years 1770-71." Dr. Hunter adds in a foot note, "Different letters represent different remissions. Before September 1770 the balance was only 80,332 *l.*; it was afterwards reduced to 65,355 *l.* out of a total demand of 1,380,269 *l.*" Now, I should rather admit Warren Hastings to have been inaccurate in a casual statement than pronounce him inhuman in having remitted so little revenue.

9763. Sir C. Wingfield.] That could not have been the land revenue demand of all Bengal, because even then the land revenue of Bengal and Behar, and Orissa, must have been very much more than that amount of 1,380,000 *l.*?—The population which Dr. Hunter speaks of as having died is 10,000,000; being a third of the entire population of which he also speaks as 30,000,000; and that further confirms my statement.

9764. Chairman.] It must have been very nearly the same then as now, seeing that the permanent settlement took place some years afterwards?—I am assuming that Dr. Hunter is right in saying that the people who paid 1,390,269 *l.*, and got so little remitted, were the people of whom 10,000,000 died. I am not answerable for Dr. Hunter's figures.

9765. Do not you think that you might form a judgment for yourself of the accuracy of the figures that you quote?—I ought to tell the Committee exactly how that is; I think that Dr. Hunter speaks of the entire province, of the 30,000,000 of Bengal.

9766. Sir S. Northcote.] I understood you to say the other day, that you consider that famines had been of late years more severe than they were formerly; and you instanced the famine of 1770 as one that you believed to have been less severe than the Orissa famine, did you not?—That the famine of 1866 was area for area very much more severe than the famine of 1770.

9767. Chairman.] From your statement that the famine of the latter year was more severe than the famine of the former year, while the deaths in the latter year were fewer than in the former year, are we to infer that the Government was better or worse in the latter period?—I am saying nothing as to the goodness or badness of the Government, except as bearing on the question as to whether famine was more severe in the last century, or the present century.

9768. I understood your observation to be, that owing to the present method of administering the Government, the people suffered more than they suffered formerly?—Yes.

9769. How is that consistent with the fact that one-third of the population, as far as the information that you give us goes, died in the former period compared with the number of deaths in the recent famine?—I was saying that a third of the population did not die. I was saying that the only warrant for saying that there had been such a mortality, an incredible mortality in Bengal, is the casual statement of Warren Hastings, not borne out either by his own statements or by the body of the evidence adduced by Dr. Hunter.

9770. Might it not be consistent with the facts that, in consequence of the high price of grain, there was a sale of grain sufficient to pay the revenue, and yet at the close of the season there

was not enough for the consumption of the people, and therefore famine ensued?—No; the Indian husbandmen are not so ignorant of the following year's requirements as not to be able to tell at the harvest whether, having paid the Government revenue, they will be able to live on the remainder of their crop till the ensuing harvest.

9771. Sir S. Northcote.] I understand you to argue that the famine of 1866 was more severe than the famine of 1770, and when your attention is drawn to the fact of this large proportion of population (which was greater than the proportion that died in 1866) died in 1770, you challenge that fact, and you challenge it, as I understand, solely on the ground that you cannot reconcile it with what you discover as to the smallness of the remission of revenue; is that so?—I refuse to allow the fact that a third of the population, that 10 millions of people died in Bengal in 1770; and I am stating the reasons why I refuse to allow it, and therefore I demur to the conclusion of Dr. Hunter.

9772. You refuse to believe it mainly because you cannot conceive that so small an amount of revenue would have been remitted if that had taken place?—Yes.

9773. Then you put the dilemma that if that amount of distress prevailed, and there was so small a remission, it proves cruelty on the part of Warren Hastings?—Either cruelty or inaccuracy.

9774. Do you set that first alternative of the dilemma completely aside as an impossible one?—Yes, Warren Hastings was not so inhuman as the casual statement given by him would imply if assumed to be true.

9775. But are you not aware that it was charged against Warren Hastings at the time, and against his system of administration; I do not say that there was personal cruelty on his part, but that the system was a cruel one which wrung these payments from the people at a time of such pressure?—Yes; and it was clearly shown how very strong the pressure applied was; and if so much pressure needed to be applied, the demand must have been a full one; and if of a full demand so little was remitted, I argue that a third of the people could not have died, and that we must allow Warren Hastings to have been inaccurate.

9776. But was not the charge against Warren Hastings that, in many instances, he put things a great deal too much into the hands of native administrators, who exercised great pressure and cruelty, which Warren Hastings was probably not personally cognisant of, for the sake of bringing up the amount that was remitted?—That was among the charges against Warren Hastings that he consciously allowed unscrupulous native agents to do as you have described.

9777. If, in a famine which takes place now, a larger amount of remission occurs than in a famine of corresponding magnitude under the old system, that will be an argument in favour of the present system as against the system which we are comparing it with, will it not?—It would, assuming the facts to be so; that is to say, assuming the correctness of the assertions made as to the comparative severity of the former and of the later famines by the official apologists for the modern Indian famines.

9778. Chairman.] Has it occurred to you that the people who died in that famine belonged to one class of the community, and that the

Mr.
J. Geddes.

Mr.
J. Geddes.

11 July
1871.

people who paid the revenue belonged to a totally different class?—No; the land revenue at that time must have reached, even more than now, the entire mass of the community.

9779. But was it the fact that at that time the zemindars paid the land revenue, or was it collected direct from the ryots, who were the persons who died in the famine?—Partly from the ryots direct, mostly through the agency of the zemindars.

9780. But was it not paid, at that time that we are speaking of, almost universally through the agency of the zemindars, and in a very small degree direct from the ryots?—Yes, I think it was.

9781. Have we any reason to suppose that the zemindars died of famine; do you think it probable that any single zemindar in Bengal died of famine?—I think it is very likely; the word "Zemindar" is a very wide one.

9782. In the sense of a zemindar being a collector or payer into the Treasury of the land revenue, do you think persons of that class and station died of famine?—Not generally.

9783. Then the persons who had to pay the revenue belonged to one class having resources peculiar to that class, and the persons who died of the famine were another class, wanting the resources of which the other class were generally possessed; is there not, therefore, a broad distinction in your own mind, between the zemindar and the ryot?—I see the distinction, but I demur to the inference. A society could not have continued; zemindars could not have obtained any credit or reserve on which to carry on the work of the year, with a mortality like that; they would not have paid the Government revenue in 1770 had a third of the population really been dying.

9784. Within your experience, did you find a difference between the position of the zemindars two or three years ago, and the position of the ryots?—Yes.

9785. And you found that the zemindars possessed resources which the ryots did not possess?—As regards surviving.

9786. You found that the zemindars did not die of famine, but that the ryots did?—In the sense in which the term "Zemindar" is ordinarily understood, do you mean?

9787. In the sense in which we are now understanding the term "Zemindar," and as it is generally understood in India, namely, as a person who pays the revenue to the Government, and does not himself occupy and cultivate the soil; did you find that class of persons dying of famine?—No; as soon as the harvest of 1865 in Orissa could be appraised by the cultivators, the zemindars all pressed the Government to remit the land revenue demand falling due at that time; the zemindars knew whether the ryots, after parting with the portion of their crops required for defraying the Government revenue, would have enough of grain remaining to enable them to tide over the following seed-time, and survive till the following harvest. The answer which Government gave to these petitions of the zemindars and ryots was a reminder that the cultivators were getting higher prices than usual for their grain, and a refusal to suspend the Government demand.

9788. But did not the power, of the zemindar equally in the latter period, and in the former period, to pay the revenue depend upon his

credit with a banker to advance the requisite funds, and on the power of the banker to make the advance?—Yes; and in Orissa in the end of 1865, and in the beginning of 1866, there was a perfect panic in all money matters throughout the Province. The people dealing in grain, the people corresponding to bankers in carrying on the business of the country, suffered a collapse of credit; the shutting of their shops was the first serious indication to the Government of the extent of the calamity.

9789. What shops are you now meaning?—The shutting of the Mahajans' shops as bankers and as shopkeepers; the two businesses are all united. A similar panic would have taken place in the harvest of 1769 had the harvest been so short as to be likely to cut off a third of the population.

9790. Still the question of the payment of the revenue was a question dependant upon the relations of the zemindar to the banking community, and their power to furnish the sum necessary to pay the demand of the Government; was it not?—Yes; and I say that had a third of the population died, both the zemindars and the bankers would have been plunged in an utter collapse of credit, and society could not have survived; had a third of the Bengalis really died in 1770, the English Government could not have continued in Bengal.

9791. You are aware that in all the large, and probably in all the small, towns in Bengal there are several bankers who make it their business to advance the zemindars, from year to year, the sum that is necessary to pay the revenue to Government; is that so?—Yes.

9792. Do you not now perceive that the payment of the revenue to Government was a question entirely independent of the means that the cultivators had to feed themselves, for the summer months?—Certainly not.

9793. Do you now begin to think that the expression "Bengal," in the remarks to which you have referred, meant Bengal as some province distinguished from Behar and Orissa, and not the Bengal Provinces, embracing those two districts also?—It could not have included Orissa, because Orissa at that time was not under our Government.

9794. But do you think that it meant the district called Bengal proper separately from the surrounding district?—Yes, Bengal and Behar, without Assam.

9795. Do you think that the famine extended to Bengal and Behar and part of Orissa?—I cannot make out how far it extended; so little has been recorded of the famine that it is a moot point whether it was owing to drought or to deluge. I think Colonel Baird Smith maintains that it was owing to rain, but later authorities have ascribed it to drought; and the very fact that there could be such a dispute on a question which determines the whole matter should make us cautious in accepting the statement that a third of the population died.

9796. But does it not appear to be the result of the whole matter, that in the last century more people died and less revenue was remitted than in the famine which recently took place?—No; that is not consistent with the character of Warren Hastings. He was not so very inconsiderate; his knowledge of native customs, his appreciation of native society, has been matched by no subsequent Governor of Bengal. He would have

have known whether the crops of 1769-70 proved such an utter failure as his casual statement would imply; and I do not think that, with his consideration, he would have continued to hold rule on the terms.

9797. Then, is this your reasoning, that, beginning with the assumption that the Government is worse now than it was before, you disbelieve the facts stated of the past time in order to make them harmonize with your opinion; because I do not understand that you have given us any ground for your disbelief of the facts in the last century, except that they are inconsistent with your theory?—I never said that the Government was worse now than then.

9798. I mean worse in its consequence to the people?—That the battle of life is harder upon the natives I certainly say.

9799. How do you make that out, I want to know, from what you have told us; because you have no facts, it would seem, from which you can discover what occurred in the last century except assuming that it must have been better for the people than it is at present?—I will read a few statements from official sources which will make it plainer. The present Lieutenant Governor of the Punjab, Mr. Davies, in a deliberate minute, comparing English and native administrations, written in 1867, while he was Chief Commissioner of Oude, says as follows: "I submit, however, that the neutrality of the masses is the corner stone of our supremacy. It is, for some reasons, far more important to us than to a native government to place the agricultural population in comfortable circumstances. In a state of never-ending war and confusion there is not the steady increase of population which follows on the restoration and fixed maintenance of peace and order. The inferior soils come under cultivation; the yield is smaller in proportion to the labour; the rude plenty of less crowded times recedes; an uneasy sense is felt of an intenser struggle more scantily rewarded." Here is the statement that I wish to draw attention to: "This, I am told by observant natives, is the spreading sentiment among the rural classes; the complaint is that there is no *'barkat'* (that means blessing or yield of the land) under the British Government. It may be remembered that Colonel Sleeman mentions exactly the same grievance being ad-duced by the Jats of the Delhi territory. The meaning is that the toil is greater, nature more niggardly, the battle of life harder. The agrarian mind attributes the change to the foreign rule, to the remittance of money to England, to the decay of native manufactures, to anything in short which runs counter to its prejudices; but here we have in reality the eternal problem which meets all peaceful Governments, native or foreign;" and then he goes on to reason upon that. I quote him to show what native opinion is; I disagree with Mr. Davies's reasoning; I quote him to show that there is a feeling among the natives that the battle of life is harder under the English than under the native administrations.

9800. According to that statement it would seem that the natives think that the soil yields less than it did before, because the English administer the Government in India?—Yes.

9801. And what is your opinion of that mode of reasoning?—I agree with them, that the state of things under which much agricultural produce is deported to London tells on the yield of the soil in the same way as the deportation of agri-

cultural produce from Ireland to other countries of Europe used to tell; that is to say, it entails a less return to the soil.

9802. Do you mean to supply a chain in the reasoning there stated, by suggesting that in consequence of the export of the agricultural produce spontaneously made by the natives, the soil is less manured and therefore yields less; that is to say, that less is returned to the soil and therefore it yields less?—Yes, I do; I account the native reasoning to be as accurate as Mr. Davies's reasoning; Mr. Davies's reasoning is according to political economy, and the natives' reasoning, also like Mr. Davies's, is an incomplete reasoning. The facts reasoned on in either case are the things to which I am applying my reasoning.

9803. Then, would it not be more correct to state, that these consequences result from the spontaneous acts of the natives, and their superior mental activity to their former condition, because that seems to be the cause according to what you have now admitted?—Do you mean that they rear produce more eagerly?

9804. No; you have stated that they spontaneously export their produce and thereby they deteriorate the productive power of the soil; is it not correct to say that the consequences are the result of their own action, their superior activity in business?—I have been all along saying that a great part of the exports are not spontaneous but compulsory.

9805. In what sense compulsory?—In order to maintain the ancestral holding the husbandman must pay in the land revenue and the other taxes to the agents of the Government; he must rear the crops which will enable him to do so; he is limited by the very fact that he has to consider what crops will bear exportation to England, or rather the village loan-monger, under whose advice he acts is thus limited; and I speak of exportation under such a system as compulsory. I could read a few more statements similar to that which I have just quoted.

9806. What are the crops to which you chiefly refer in that statement, which have to be exported and which injure the soil?—The superior crops, as a rule, are such as wheat and sugar-cane destined mostly for sale to consumers better off than the cultivators in the country; also cotton, opium, oil-seeds, and other similar crops all over India, destined mostly for consumers out of the country. I have prepared a paper showing chronologically how far I think the element of compulsion enters into the progress of exports and imports, and with the leave of the Committee I propose to put it in. It will explain more clearly what I was unable to state so clearly as I should have liked to have done to Mr. Cave on the last occasion. Proceeding with my supplementary statements upon my last day's evidence, in answer to Questions 9551 to 9553, I find that I have made an incomplete answer to Mr. Smith. I had spoken of the expenses of collecting the land revenue constantly increasing, and I had quoted a particular statement indicating that. The answer, as it stands, would imply that I supposed that the pension charge of the collectors was one of the items in pages 14 and 19 of the Calcutta Serial, Part I.; I wish my answer to Mr. Smith to be simply, that the expenses of collecting, one way or another, whether under that table or not under that table, are constantly increasing. I make my reference not only to these tables of land revenue, income and

1871.

and charge, 1860-1869, but to the entire chronological view of land revenue, gross and net, 1792-1869. Then in answer to Question 9648, I say, "The sale proceeds of a khas mehal representing the capitalised amount of a certain potential annuity for the Government;" I mean to say there, "A certain actual annuity for the Government and also a certain potential annuity." Then at Question 9657 I was asked, "Do you consider that it is any part of the duty of a servant of the Government to be in harmony with the general spirit of the government that he serves?" I hope that the statements which I am putting in to-day will show that at all events in the most serious parts of the evidence which I have to give I am confirmed by very high authority. Then at Question 9677, I was asked whether I thought that what was needful was a Committee of Public Safety, and not what I described as an "Alice in Wonderland Jury at Saint Stephen's." If the phrase "Committee of Public Safety" is objected to, I wish to note, that I use a phrase already employed by the late Commander-in-Chief of India, Sir William Mansfield. I wish further to state that when I published my pamphlet, at that time it was not known that there was to be a Committee; on the contrary, the general opinion was that Mr. Fawcett's motion would be disallowed by the Government. The phrase therefore did not apply to the present Committee; on the contrary, so far from speaking of the present Committee, upon hearing of the appointment of this Committee I suspended all further publication. When I deprecated such a Committee as that of 1852, I spoke of a Committee which not only failed to take any definite action whatsoever, but which drifted in purposeless inactivity, and was at last succeeded and put to utter shame in a few years later by the terrible disasters of 1857. At Question 9714 there is this question: "Would they not always put him into caste again if he paid a sufficient sum of money; do you not know that a person who is not one of the exalted caste if he weighs himself against gold and gives weight enough is made a Brahmin?" Concerning my answer to that I wish to state that I did not hear the latter part of the question; I did not hear the part "Do you not know that a person who is not one of the exalted caste, if he weighs himself against gold and gives gold enough, is made a Brahmin?" My answer "Yes," therefore, is incorrect; any one who holds such an opinion has no knowledge whatever of native sociology. The rich man has this advantage over the poorer man, that in the least given to conciliate the brotherhood he can afford the means more readily than the poor man can; but the relations of caste are not matters solely of bribery or of money purchase.

9807. Is there not a great deal of money paid in matters of caste to adjust disputes?—I have said that a rich man can do a great many things in India which a poor man cannot, just in the same way as a rich man in this country can do a great many things which a poor man cannot.

9808. Mr. Candlish.] And everywhere?—Everywhere.

9809. Chairman.] Therefore the religious influence is not so entirely predominant as to lead us to suppose that those affairs in India amongst the natives are entirely influenced by religious considerations?—Neither there nor here, neither with Hindus nor with Englishmen are affairs entirely influenced by religious considerations.

Then, proceeding with my further supplementary statements, in answer to Question 9722, I said: "I think that all our early historians exaggerate the extent of disorder in India; that they exaggerate the breakdown of native society." I omitted to state there, that I think in reading the early historians, we must remember the attitude of partial hostility in which Orme and all the early historians stood themselves towards native rule, and the eagerness with which they were ready to applaud all the transactions which secured greater dominion for the Company.

9810. But apart from the early historians, what do you think of the representations that are made of the state of India when the Pindaries were roving, and when they were put down, and when the Mahratta incursions were rife and when they were stopped, and the disorganisation consequent upon them was arrested, at the end of the past century and the beginning of the present century, all through the establishment of the British rule?—At that time we ourselves had come upon the field, and our very appearance on the field added to the complication and to the convulsion of native society.

9811. But do you think that at the period when the British Government was extending itself in India, society was in a settled and orderly condition, or that the country was very much overrun by marauders and that the constituted authority of the earlier Governments had been very much subverted?—It had been very much subverted, partly from causes inherent in themselves, and partly also from the very existence of a foreign power within the Peninsula.

9812. Still, as a matter of fact, do you consider that the state of India then was better than the state of India now, in regard to the comfort and protection of the native community?—That is asking me to compare a time of anarchy with the present time. I am not prepared to give an answer. I think it is very possible that the few hundreds of thousands, perhaps one or two millions, of people who have died lately of starvation would have thought it at least as good to die (if they had to die prematurely at all); under the warlike disorder of native rule then in transition, as under the powerful order of English rule; therefore I am not prepared to say whether India is in a better state now than then.

9813. Do you think, as regards the general security and protection to life and property in India, that it was in as good a state at the time when the British Government was expanding itself as it is now?—No, I should not say that.

9814. Do you think that it was in a very much worse state than it is now?—Any state of order is better than anarchy. We have nothing that I count better for the people than the state of things which went before.

9815. But do you think that, as regards the protection of life and property to the masses of the people, society or the country was in a very much worse condition then than it is now?—Do you mean in the States outside the English dominion at that time.

9816. I am speaking with regard to the expansion of the British Government, that is, taking the condition of the different States before they were acquired by the British Government, and comparing it with their condition now?—If the British Government would have abstained, or could have abstained from annexing them, society would have been much better off under the native

native Government than under the English Government.

9817. I am asking you, not speculatively, what might have happened; but as regards the actual condition of the people in protection to life and property immediately before the British Government commenced its rule, whether that condition was better or worse than it is now?—In order to be able to answer that question, I should wish to have some more precise date given me; say whether at the time when the English dominion stopped here, or at the time when it extended over there.

9818. I am taking it generally with regard to each district before it was acquired by the British Government; what is your opinion, speaking generally?—Well I imagine that Orissa was better off before our annexation.

9819. That the life and property of the mass of the people was more protected?—Yes; that people did not starve so much; that they were not so liable to starvation, and that property was fairly protected.

9820. You are now going upon the famines, but I am speaking of the general civil Government of the country, apart from the question of the casualties of the harvest; were they better off in that general view?—Yes, I think they were. I think Orissa was more prosperous before our Government than it is now.

9821. Now, do you extend that view to the other provinces which have been acquired, Kandeish and the Deccan?—I could not apply it to Oude for example; I should require to examine more carefully, before I applied to Oude all the things that I have read about Oude; but like Mr. Shore, in his "Notes on Indian Affairs," I am unable to say how far disorder in Oude was due to our rule in those territories of ours which surrounded the frontiers of Oude. At one time I took overcharge of a district which had just been annexed from Bhootan, and from the statements made by natives on the other side and on our own side of the frontier, the impression left on my mind (that is five years ago), was that our people were more in fault than the people on the other side for embroiling us in the war.

9822. Have you anything else to add to your evidence?—I should like to state more clearly what I meant by my statement, that there never had been a surplus in India under the English Government; I should like to put more clearly, than I succeeded in doing the other day, how the accounts of each of those years which are claimed as having resulted in surplus ought, according to correct accountancy and auditing, to have been properly exhibited. I take first the year 1863-64, and I quote here the accounts laid before the House of Commons, as quoted by the Calcutta Financial Blue-books; the revenue is set down at 44,279,467 *l.*, and the expenditure is stated at 44,201,120 *l.*; the accounts purported to show a surplus, therefore, of 78,347 *l.* I should question the business-like accuracy of that statement; I should ask to deduct certain sums credited, which, I think, ought not to have been credited to that year's income, sums amounting to 1,198,622 *l.* Not only so, but it will be necessary in order to have the accounts properly stated to add on the expenditure side a charge for stores that has been omitted in the accounts amounting to 447,321 *l.* If those erroneous credits be deducted, and the omitted debit be

0.59;

added, the result will be a deficit of 1,567,676 *l.*, and not a surplus of 78,347 *l.*

9823. Assuming the balances of the Treasury to remain the same, the deficits in successive years are measured by the debt?—Yes, that is supposing that no part of the debt has ever been paid off out of loan.

9824. Would not that be immaterial; it would only be putting money on the other side of the account; the actual fact is, that the deficit in the administration of India since it began is measured by the amount of the debt that is now owing?—Yes, but it might not be so from year to year; in one particular year you might just have paid off some debt out of borrowed money.

9825. Your expression was that there never had been a surplus?—There never has been a surplus if the credits and debits be placed on their proper side as a merchant would place them in his books, and as a finance member anywhere out of India would range them in his budgets.

9826. Would it not be immaterial how the credits and debits had been placed; the practical result would be the same, because the deficit would be measured by the debt?—Yes, provided the increase of debt be sufficiently acknowledged. One series of the India Office blue books brought down to 1870 sets down that year, 1863-64, as not in surplus by 78,347 *l.*, but as in deficit by 368,974 *l.* I should mention, in order to let the Committee cross-examine me upon it, what those items, which seem to me erroneous, are. They are first proceeds of sale of property and stores in the Civil Department. That seems to me an exceptional item of credit coming after years of very heavy deficits.

9827. But any credits that arise from anything sold must necessarily be the result of an expenditure in a former year, the result of something bought?—And bought, therefore, out of debt in a former year of deficit.

9828. Therefore if the expenditure in a former year was part of the expense, the receipt in a subsequent year must be part of the income?—It should be passed through the income side of the year's cash balance; whether it should be carried to current expenditure is the question on which I differ.

9829. Then if you object to the receipt coming from this source being part of the income, you would necessarily have to object to the expenditure from which the receipt came being part of the current expenditure of a former year?—Yes; what I maintain is that the Indian chancellor should have honestly faced a restatement of the misfortune that the one year like the other year, the later year as well as the earlier years, had resulted properly in deficit.

9830. Then in the former year would you not take out the expenditure?—No, I am not going upon the former year at all.

9831. I understand you to object to the proceeds of the sale of stores being treated as part of the income of the year?—Yes, where these stores had been obtained only by incurring debt.

9832. If that be so, must you not object to the expenditure for the purchase of those stores being part of the current expense of a previous year?—Certainly; I object to a practice of the Indian Government for many years, whereby part of the charges for stores was reserved in a suspense memorandum, withheld from the statement of expenditure, and finally, it would seem, defrayed out of debt. I object to the practice, because

Mr.
J. Geddes.

1871.

the annual accounts profess to exhibit every item of charge in full.

9833. How would you make out the accounts?—For example, between 1857 and 1865 the charge for the pencils and steel pens by which the Government was carried on ought to have been debited in full among the several years' proper expenditures.

9834. The only difference would be that a certain number of items would be taken out of the account on one side or the other, and exhibited in a separate account instead of all being put in one account?—No; if you have to borrow money in one year to enable you to go on, it is not a business-like way to carry part of the proceeds of that loan in a subsequent year to current expenditure; it would be more business like to face the fact that comes up in both the years, that the expenditure had not been equalled by the income.

9835. But after all is it not simply a question of having an intelligent knowledge of the nature of the accounts; if a person understands what the accounts are, cannot he carry on the Government of India with those accounts?—So long as he can raise the new funds by borrowing, and so long as the lenders are not induced by mistaken statements to lend on mistaken budgets.

9836. Then is your objection to these accounts this, that they induce people to lend to the Government on erroneous impressions?—That is my impression.

9837. You think that the public have lent their money to the Government of India at a lower rate of interest than they otherwise would have done in consequence of the way in which the accounts have been kept?—Yes. I can go on with the other items which I object to, the further sums aggregating that amount which I have mentioned, in each of the other years of alleged surplus.

9838. I do not think that you need pursue that; it would not affect the administration of the Government of India if those who administered the Government understood the accounts, would it?—I think it would, and that is why I wished to put it down as the reason for my answer.

9839. Do you suppose that those responsible for administering the Government of India do not understand the accounts?—No, I do not suppose anything of the kind.

9840. If they do, how can they be misled by them?—I imagine that they are misled by them when, understanding how a credit should be entered, they have failed to enter it properly.

9841. If they understand what the accounts mean, what they represent, can they be misled by them?—Yes, they are constantly misled by them; they allege a surplus in one year and a surplus in another year, which they ought not to allege.

9842. But that is only a form of statement of the accounts?—But it affects all their administration if they think that the country has paid its way; it affects every proposition to borrow money at that period and at every subsequent period; it affects their administration at every moment.

9843. Could any Government believe that it had paid its way out of its income if, as the result of the operations of the year, they had to borrow money to make good a deficit?—I think they could, from this very instance.

9844. Do you suppose that the Government did not understand the nature of the account, although the mode in which it may have been stated may be different from that which you think is the convenient mode?—Which Government; because the Government is perpetually varying?

9845. The Government in India; do you suppose that they did not know what the receipts were; whether the receipts were casual receipts or permanent annual receipts, and whether the payments were payments which would recur from year to year?—Many of them did so; and it is chiefly from remonstrances of theirs that I make the statement, remonstrances I mean, as to the impolicy of carrying those credits from one year to another.

9846. Does not that show that they perfectly knew the value of the accounts?—Yes.

9847. And, that being so, they were perfectly capable of taking a correct view of the financial position of India?—Yes, at the particular moment of their view.

9848. Therefore, their administration of India could not have been affected by the circumstance of the form of the accounts?—But the officials in India are in perpetual fluctuation; one policy may obtain in one year, and three years after another finance minister adopts a different policy.

9849. The question is, whether he has a consciousness of the financial position of India, whatever his policy may be, or whether he is unconscious of the financial position of India, having been misled by the accounts; according to your statement he perfectly understood the accounts?—Not the Finance minister; he did not understand the accounts.

9850. But somebody in the Government did?—Some of the members of the Council.

9851. Therefore, he was informed of the matter?—In many cases he was informed of the matter.

9852. Then it would seem to come back to this, which you stated just now, not that the administration of the Government of India had been affected by these figures, but that creditors outside who do not understand them, lend their money too cheaply to the Government?—I have already stated that the action of the Government has been affected by the view that they have taken, whether they have achieved a surplus or contracted a deficit, and I have also stated that the action of creditors outside was affected.

9853. Mr. Cave.] The rate at which money is lent is managed on the Stock Exchange, is it not?—Yes.

9854. And the Stock Exchange is not generally misled by a mere statement of accounts, is it?—I think that they often are; I think that the extraordinary disasters which every now and then overtake the Stock Exchange, do show that the opinion of the Stock Exchange often is erroneous.

9855. That is rather with regard to certain members of the Stock Exchange having a favourable opinion on speculative questions, is it not?—Yes; and I take every financial question to be a speculative question.

9856. But accounts already stated cease to be a speculative question, do they not?—No; the question as to whether a set of accounts has been properly stated or not is itself a speculative question, and a speculative question of no little difficulty and complexity.

9857. But

9857. But the Stock Exchange would be capable, though they might not be able to see into the future, of forming a sound opinion as to the mode in which accounts are stated, would they not?—No, I think that nothing has been so often deluded as the Stock Exchange by erroneous making up of accounts.

9858. Are you aware that the Commissioners who inquired into this famine in Orissa, reconcile that apparent discrepancy to which you have alluded, with regard to drought and floods, by showing that floods had caused considerable disaster in the first instance, and that they were followed, as is very often the case, by a severe drought; that the disaster of 1770 was produced by an excessive fall of rain which at first did very great damage to the crops, and then by excessive drought which finished the destruction?—Yes.

9859. Would not that therefore show that the apparent discrepancy would not throw so much discredit as you appear to think upon the history of the former famine?—Do you mean that if the former famine was caused partly by flood and partly by drought, the question of blame of the Government does not enter into the matter?

9860. No; what I wanted to ask was, whether that would not show that the discrepancy between the two accounts was rather apparent than real; that one person stated what came under his notice, which was the excessive deluge, and others that which came under their notice, namely, the drought, but that according to the commissioners both took place, and therefore there was no discrepancy in the account of the two narrators?—It is an important element in the fact as to whether 10,000,000 of people could have died, whether it was caused by drought or by flood, or whether there could have been any doubt as to which had caused it.

9861. But the commissioners express no doubt; they state that it was caused by flood and by drought, that flood and drought generally co-operated in the great destruction, those are their words; I want to ask, therefore, whether the discrepancy is not merely apparent, and whether it throws any discredit on the account of that famine?—I think, if you have any doubt upon the one vital question of the whole phenomenon, it throws discredit on the assumption that 10,000,000 of people died. If we know not whether the damage to the harvest was due to the parching of the whole of Bengal by drought, which seems almost incredible, or to the flooding of the whole of Bengal by inundation, which is absolutely incredible, we really know very little of the famine of 1770.

9862. There is very great detail, is there not, in the accounts given of the former famine, and we find that the price of rice is given at different times; 11 seers per rupee (which, of course, is almost a famine price), and the price rising to 3½ and even 1½ and 1 seer per rupee; those are details stated with reference to the famine of 1770?—Yes.

9863. And is it not the fact that those were almost exactly the same prices as ruled during the latter famine in Orissa?—Yes, I observe that the Famine Commissioners do reason in that way. I differ from the Famine Commissioners in their reasoning about that, and on the whole of this part of their reasoning as to the causes. The Famine Commissioners who inquired into Orissa, for example, ascribe the short supply of food in Orissa to the great demand in foreign

countries; as if, forsooth, the people would have sold beyond what prudence would of their own free choice have suggested. On the same reasoning, any one deputed to inquire into the condition of the Israelites under Pharaoh might have said that their condition was due to a great demand for bricks and mortar; but that would not have been a sufficient explanation of the phenomenon.

9864. Does it not rather coincide with your own explanation of the reason of famines in the present day, the excessive export of the produce of the land?—Yes; but I say that it is not a spontaneous supply, corresponding to the other demand.

9865. No; but, if you get rid of the produce, it does not much matter for what reason you get rid of it; the famine comes all the same?—Assuming that the land revenue remained fixed at, say, one-seventh or one-fifth of the gross produce of the year, and that the yield of produce is seven times the seed, you must consider the necessity of parting with so large a proportion of the crop in order to meet the land revenue and other demands as part of that very problem of famine. The burden of explaining how there should be famine at all rests upon a foreign Government whose subject taxpayers die of starvation by the million.

9866. But you do not doubt these prices which are quoted by the Commissioners as regards the famine of 1770 and the famine of 1866, do you?—No, I do not; but there is very great difficulty in getting accurate prices, as the Famine Commissioners themselves point out. For example, you have constantly two series of prices: you have a price at which the village loanmonger is taking over from the indebted cultivators, and you have the different sets of prices in the rates at which the village loanmonger is selling to foreign exporters. No view of prices would give a complete view of any question of famine in India.

9867. During the height of this famine I imagine that there was no food bought except for immediate consumption in the place, and the prices during the famine were the prices given on the spot by the people who were the consumers?—Yes, you may take the prices to have been generally those on the spot; what I am saying is, that a mere comparison of the numerical ratios of prices will not tell you fully what the condition of a people is in India.

9868. Not in ordinary times, but at the time when the price was one seer per rupee, there is no doubt whatever, is there, that that was the price paid on the spot for purposes of consumption at a time of great famine?—Just so.

9869. And you do not doubt, therefore, that the prices that ruled in Orissa in 1770 were the same as those which ruled in 1866?—That the numbers quoted by the Commissioners are correct, I have no doubt.

9870. And that the population in Orissa in those days were poorer than they are in the present day?—No, there I should demur.

9871. What reason have you for thinking that they were better off in 1770, in contradiction to the opinion of the Commissioners?—I did not notice that the Commissioners had compared their condition in 1770 with that of 1866.

9872. You will observe that in paragraph 15 they say that on the whole the prices before the famine of 1770 may have been not far different from those in Orissa before the late famine?—I have already stated

Mr.
J. Geddes.

11 July
1871.

Mr.
J Gaddes.
11 July
1871.

stated that I do not think the Orissa people were poorer, and that a mere comparison of quotations of food prices will not settle the question.

9873. Have you any data on which you base those opinions?—The native traditions which are sufficiently abundant to indicate any such disasters as that of 1866, point to no disaster like that of 1866 as occurring in 1770. That is one of the things which guide me in thinking of 1770. I do not remember that any new castes had arisen out of famines in the last century, whereas the whole of society, and the whole of the system of caste in Orissa for many generations to come will bear a very marked impress indeed of the famine of 1866. In the absence of any such sociological register of greater poverty in the last century, I question the opinion expressed by the Commissioners.

9874. Then that is really speaking from what you knew of the people before the famine of 1866, compared with what you think would be their condition 100 years hence?—No, taking the condition which I, living among the people, knew them to be in immediately after 1866, and the condition of the people as I could gather it from very careful personal observation and inquiry, relating to the past.

9875. It is, therefore, as I say, that the effects of the former famine of 1770, you think, were not so great as the effects of the present famine will be 100 years hence?—I cannot say that, and I do not say that, because I do not know what the effects of the famine 100 years hence will be.

9876. That is what I wanted to bring you to. I thought you said that the effects of the famine 100 years ago upon the people were not so great as they will be 100 years hence, in consequence of this famine?—No; what I said was, that native society is not impressed with any mark of trouble in the last century, such as it wears and long will wear owing to the disasters of 1866.

9877. But that was 100 years ago?—If you wish to ask whether I should expect another famine of 1866 to be more severe 100 years hence, I say, that if the English dominion continues 100 years going on in the same way as heretofore, such a famine would be much more severe.

9878. I do not want to go into that. You stated, as I understand, that the effects of the famine of 1770 have not been so great upon the people as the effects of the famine of 1866 have been?—Yes.

9879. Then what I want to ask is this, how do you know that, because the first famine was 100 years ago?—I have told you that native society is no inaccurate register; it itself registers any such crisis as that of 1866, and would record any crisis of the kind which had taken place in the last century, and it does not record any such crisis.

9880. You mean that native society is such that you would be able to trace for 100 years the effects of such a famine as that of 1866?—Yes.

9881. And that you have not such traces with regard to the famine of 1770?—Precisely so; and amongst other tests we have an intermediate famine of 1837 which enables us to speak on the question, a very great famine, but very much less severe than the famine of the year 1866. The famine of 1837 was much more severe than the famine of 1783, which was the chief famine immediately before it, and the one most vividly impressed on the native mind.

9882. That is going into another argument,

that each famine is more severe than the one before it. I do not understand how you can prove from the state of Indian society that the famine of 1770 was not as severe as the famine of 1866. What standard do you take?—Such standards as I was able to obtain by inquiry among the natives.

9883. *Chairman.*] You say that you draw an inference from the present state of things as to what occurred 100 years ago. How can you draw that inference unless there are other instances of what is existing now and what occurred 100 years ago, so as to form a standard on which you could make the inference?—I took the intermediate famine of 1837, and quoted other famines.

9884. That is not 100 years ago?—About an hour ago I was explaining what I thought to be the situation in 1770. I gave all the reasons then for my statements. One leading feature in the later famines as compared with the earlier famines is the much greater distress as shown in the plough cattle. Nor is it only during a crisis of famine, after a short grain crop, that cattle suffer. At other times, and at all times, under our rule, the Indian cattle are degenerating in breed from stint of food. The larger area put under cultivation, the limited area of pasturage tells on the condition of the working stock of the peasants. Comparing the states, under purely native administration, and those under English administration, we find the peculiar phenomenon that the cattle there are always spoken of as so much superior to those in our country. For example, in Mysore, or Nagpore or Berar, the animals are notoriously spoken of as superior to the cattle in the other dominions, that is in the British dominions.

9885. Is not that due to special causes?—I say that it is owing to the increase of compulsory exports.

9886. Do not you think that the state of the cattle in those particular parts of India is due to particular conditions of climate and other circumstances, and not to the state of the Government?—“Other circumstances,” including in them what I hold to be the most vital part of all, the weight of taxation.

9887. You do not think that it is due to the particularly large regions in which cattle can be reared, and in which no taxation is levied, because they are hill districts, which are not brought under assessment in the same way as cultivated districts are?—That does explain it partially. For example, in Assam the cattle are better off than in Bengal proper, because they have access to waste lands without any reference whatever to the taxation; that does explain part of it; it would explain it in the same way in Mysore and Berar also.

9888. Those hill districts are not liable to assessment in the same way that the low lands are?—That is so.

9889. And are you not aware that in the British territory, hill districts of the same character are not subject to the same sort of assessment as the low lands are?—Yes.

9890. And where there is the same sort of pasturage and the same means of rearing cattle, the cattle generally are found in a very fine condition; is not that so?—Yes.

9891. Especially where the cattle are used for the purposes of transport largely; there the rearing of cattle is more largely carried on and more carefully attended to?—That is so.

9892. It

Mr.
J. Geddes.
11 July
1871.

9892. It does not seem then to result from a particular form of Government?—I may be wrong, but I think it does; I think that the phenomenon is much wider than you suppose. For example, we cannot supply the native cavalry with horses, and we cannot supply our commissariat wants with bullocks, so good as we obtained formerly. This phenomenon extends much beyond the region of the lower assessed hill tracts, and therefore demands quite another explanation than that suggested by your words. Cattle disease, about which I have already remarked, when once begun in the worse fed herds of one territory spreads by contagion to the better fed herds of other territories of India.

9893. Sir D. Wedderburn.] Is it not the case that Orissa is a particularly isolated country having no good harbours on the coast, and surrounded on the west side by a very mountainous and jungly district?—Yes.

9894. It is one of those districts where any local drought or deluge would cause the subsequent famine to be felt with very peculiar severity?—Yes; I do not think that that accounts entirely for the peculiar severity of the famine in Orissa, because the harbours are good enough to allow the people to deport their produce; the means of deportation are sufficient; the means of importation were amply proved to be very sufficient in 1867, the subsequent year of relief; it was not so much the difficulty of importation that caused the great loss of life, but the social difficulty much more of feeding a people living under the system of caste, and too poor to buy uncooked food.

9895. I believe that owing to the defective communications which still exist in most parts of India, what used to occur in old times still occurs, that one district may be suffering from famine while comparative plenty is reigning in a district at no great distance?—You have that often.

9896. Then you consider on that account that it is especially important in India, much more so than it would be in Europe, that each district should grow food for its own consumption, and should not depend for its food supply upon that which is imported when scarcity arises?—Yes.

9897. Not to depend upon food finding its way to the place when the demand arises, as it would undoubtedly do in Europe?—Yes; the hope of food coming in to supply a depleted food reserve is of little avail in India.

9898. Then you consider that although our Government has done much to improve communications, it has done more than compensating mischief by the stimulus of the growth of other staples, such as cotton and opium in place of grain?—Yes.

9899. And I gather from your evidence that you regard the British Government somewhat in the light of an absentee landlord on a gigantic scale?—Yes, not only an absentee landlord on a gigantic scale, but an absentee landlord who is under the cruel necessity of being unable to stop importing borrowed money into the country to make good the continuous drain from which the country suffers.

9900. Then you consider that there is a steady depletion of wealth from India to England, a large proportion of it coming here to pay the interest upon undertakings instituted under the auspices of the Government, and which have turned out unremunerative?—Yes; for example, that transaction of which Mr. Ayrton spoke last time on the Great Indian Peninsula Railway; all

Works came down to the amount of 1,300,000/; those had to be rebuilt, and, I imagine, new capital created on the great Indian Peninsula Railway. Thus the empire of India was at once subjected to a compulsory and gratuitous deportation of produce to the amount of 65,000/ a year, besides cost of transportation and other charges. Now, 65,000/ a year is about the land revenue of an ordinary zillah, or district. Therefore that one failure of works simply amounted to writing off to profit and loss the fee simple of the land revenue of one of the 220 districts of the empire. That is only a specimen of the waste going on.

9901. Mr. Birley.] Do I rightly understand that you are seriously of opinion that India is becoming poorer instead of richer under the present rule?—I am sorry to say I am.

9902. There is a large and an increasing accumulation of wealth, is there not, in India, in respect of bullion, in the hands of the natives?—No, I think not; I was giving, on the last time when I was examined, the amount of excess of imports over exports of bullion. For the last 67 years it amounts to 311,000,000/ sterling, being an average rate of 4½ millions a year. Mr. Newmarch, the actuary, thinks that an annual import of four millions a year would be necessary to replace the inevitable wear and tear of bullion held in the very petty sums in which it is in India. I agree with him in a great part of that calculation, and I think that the annual importation of bullion is not much more than sufficient to replace the wear and tear, or at all events that it is not so much more than sufficient as the mere statement of an importation of 311,000,000/ would imply. When we hear of 311,000,000/, we call it ten times the Reserve Fund of the Bank of England, and we are apt to assume the existence of corresponding wealth, other than bullion as connoted by the 311,000,000/, but that is an erroneous way of looking at it. One of the things on which I made a very careful inquiry as likely to be an index to the question of increasing poverty or increasing wealth, was the question about the rate of interest, which I also left incomplete last day. I should like to state how far I had ascertained anything definite, and how very far I had utterly failed to ascertain anything precise. Natives, as a rule, maintain that the rate of interest has been on the increase. On my inquiring into their reasons, some of them have given me such a reason as this: the Government about 1855 abolished the usury laws, and empowered any money lender to charge what rate he chose. A great many natives would tell me on my inquiry of them, that in their opinion the rate of interest rose because the Mahajans had obtained full power over the rate of interest, a change which they thought a misfortune. Of course that reasoning would not follow. But natives assign facts, and when asked for reasons, they give insufficient reasons often, while at the same time the fact cannot be put aside. One of the leading and most important papers on the question of the rate of interest is a set of papers published by the Chief Commissioner of Oude, Mr. Davies, on the indebtedness of cultivators. He and all his subordinate officers inquired into the question very carefully. Of course there has not been time since the annexation of Oude to judge as to the effect of English dominion and native dominion with regard to the rate of interest; but Mr. Davies, the Chief Commissioner, was of opinion that

Mr.
J. Geddes.

11 July
1871.

that probably the indebtedness of cultivators was not on the increase. Some of the settlement officers who reported to him certainly speak of indebtedness as on the increase. I remember that one of them, the officer of Bareilly, speaks of 70,000 householders out of 90,000 being indebted to the village loan monger. The amount of indebtedness of course would be a means of ascertaining the rise or fall of the rate of interest.

9903. Is there much pressure upon the cultivators from claims by bankers and money lenders; do they suffer much in that way?—A cultivator, as a rule, has no control whatever over his crop; it is entirely in the hands of the shroff and the zemindar as a rule.

9904. What is the process against the cultivators if they are not able to meet their engagements?—The process would be an instantaneous suit in court, which would come very severely, because if the householder is sold out of his house and home there is no other calamity beyond that so severe in native opinion.

9905. What was the law under native rule with regard to that matter?—The natives speak of the native rule as having more of the give and take disposition.

9906. Less rigid?—Less rigid. Mr. Campbell, the present Lieutenant Governor of Bengal, describes in this Orissa Famine Report how much harder things are for the poor of late years than they had been in former times. That is one among the papers which I have put in.

9907. Is that in consequence of the hand of the foreigner, the British ruler, being more severe, or is it in consequence of the native money dealer?—In consequence of British rule being not willingly more severe, but in effect more severe. One of the things upon which I tried to ascertain the state of things as to increase or decrease of indebtedness or the rate of interest, was the question as to the progress in certain crops, as to whether the crops for export had been on the increase, as to whether the crops under the control of the mahajan were mostly the crops intended or destined for exportation; and on the whole I thought that they were, but the evidence is very incomplete. My opinions on many of these questions are in suspense.

9908. Do you consider that the increase of the crops intended for export, such as cotton, and opium, and indigo, interferes with the necessary production of food for the people?—Yes, certainly.

9909. In an alarming degree?—Yes.

9910. Mr. Beach.] It is generally an object of producers to obtain the best markets that they can for what they produce, is it not?—Yes.

9911. Would it not be a tendency in the native producers, whether taxation were levied or not, to export their produce, if they could obtain a better sale for it thereby?—Yes.

9912. Then in what way does obtaining the best market which they can for their produce impoverish them, or impoverish the country?—If the best market is limited, it does affect them; if the whole of the forces governing production and distribution of produce in India tend to a deportation to London, the so called best market is not a free market.

9913. But the deportation to London is simply because there is a better market there than there is on the spot, is it not?—Better, because there is no other. For example, you have these Com-

missioners saying here that one of the misfortunes of Orissa and Bengal is, that they have so little trade with countries like Java, tropical and sub-tropical countries, which could supply their wants in the vicissitudes of the seasons.

9914. But what is there to prevent them exporting their produce to Java?—The fact that the greater part of the produce which they can rear has to go elsewhere.

9915. Why?—It must go either to London or some other customer of London, in order to enable certain payments to be laid down in London.

9916. I do not understand why; if they can receive the amount of their produce, surely it would be best for their interest to obtain the greatest amount that they can?—Yes, and in doing so many of them starve.

9917. If they can obtain a larger amount in Java than they can in London, why should they starve in consequence of obtaining it?—They do not obtain a larger amount in Java; they have nothing to send to Java, nothing which would obtain a market in Java.

9918. I thought you stated that it would be better for their interest if they could export some of the produce to Java; Yes, if the condition of the trade in the East was so entirely spontaneous that Java, say, could minister to India and India to Java, as they certainly did long ago, before the advent of the English in India and of the Dutch in Java.

9919. If they have articles to send to Java, I do not understand what prevents their sending them at the present time?—They can only rear a given amount of produce, and over the ultimate destiny of it they have no control.

9920. If the inhabitants of Java wish to obtain a portion of the produce of India, what is to prevent their doing so at the present moment, and what is to prevent the inhabitants of India sending these articles to Java if they can get a good market for them?—The great object of the ryot in India is to get some kind of a settlement with the village loan-monger at the next harvest, and to be able to pay his rent some way or other to the landlord; to be able to get a little money, and to be sure to keep off the police at any time if necessary. He cannot think of what would find a market in Java, and the mahajan with whom he deals, the mortgagee who controls his industry, considers only what will be the best market available for him; he considers the market of London the best one; the ryot therefore is not a free agent to that extent.

9921. Chairman.] In what way is he not a free agent?—If a seventh of the gross produce of his land, say (taking the average amount of the land tax that is usually estimated in India), has to be parted with in order to maintain his ancestral holding, the cultivator is not a free agent altogether; you must consider the amount of compulsion as part of the set of phenomena to be considered.

9922. Do you suppose that there ever was a time when the ryot was a merchant to export his produce, or did he always sell it to some home dealer who took his produce at his own door?—I wish I could think that the indebtedness of the cultivator was not on the increase in India.

9923. What is your view on that point?—I fear it is on the increase.

9924. Is it your view, I mean, that at any time the cultivator was a merchant to export his produce abroad, or did he always deal with some one

at his own door who purchased his produce then as he purchases it now?—No: at all times you have a certain amount of compulsion everywhere, under every form of government; what I say is, that in considering the condition of the cultivator, either at a former or at the present time, you must take into account the compulsion applied as part of the very problem to be studied.

9925. *Mr. Beach.*] If the produce must necessarily be disposed of on the spot, it would be necessary to place an export duty on the produce of the soil, just as England did at the time of the Plantagenets on the export of wool?—That is the constant impulse of the ryots, and that is what the ryots always ask for. Whenever there is any scarcity, they ask two things always: "Stop the demand of the Government revenue; that will relieve us of the necessity of selling to the Mahajan." That is one thing they ask. On the other hand they say "Wipe off debts, or postpone them for a year or two."

9926. That would necessitate the hoarding of produce?—It is in order to enable produce to be hoarded over the season succeeding the short crop; and that I say is the attitude taken by the ryots in the prospect of drought.

9927. *Chairman.*] Did you not give a third idea, namely, that they wish that the export of produce should be stopped?—Yes, that is one of the things; the demand to give up the exportation is always one of the most prominent features of an inchoate famine. Sometimes you have the theories of political economy utterly confuted, and officers driven to their wits ends, actually set aside those theories and give the real explanation. The following I quote from an extract from a report of the Collector of Purneah, dated 30th October 1865, at page 62 of the Parliamentary Papers relating to the famine in Behar. He says, speaking of the autumn before the famine, "The export trade is as brisk as ever; this is a great cause of the present scarcity; one would expect that a failure of the crops would check exportation; that it has not had this effect in Purneah is, I think, due to the fact that the grain grower is always in debt to the grain merchant, and is bound to deliver so much rice after each harvest; he may be starving, but that is no affair of the grain merchant; he will have the rice, or the ryot is sued in the civil court and ruined. At the present moment there are merchants from other districts, Mirzapore and Arrah especially, buying up the grain of Rancegunge and elsewhere; as fast as the grain is brought in by the ryot it is sold to them and transferred to their boats; such a state of things is almost enough to tempt one to forget political economy for once and stop the export."

9928. *Mr. Beach.*] You do not think yourself, in your mature judgment, that prohibiting the export of the produce of the soil and compelling the natives to hoard it, would produce any increase of wealth in the country, do you?—Yes, because you would partly stop the export if you ceased to apply the compulsion, under which the exportation is necessary.

9929. *Chairman.*] Are you putting forward as a serious proposition that the Government should interfere to prevent a man selling his property; that the Government should regulate how he should enjoy his property?—No.

9930. You would have him perfectly free?—Yes, free as far as possible.

9931. What do you mean by "as far as possible?"

sible"; do you mean that the Government should still find a possible limit for the enjoyment of his property, and impose restrictions upon him?—My theory is that part of the cost of administration of India should be borne out of English taxation. It would be a relief to the cultivators if they had not the Secretary of State drawing upon India.

9932. Take the particular proposition that the cultivator has produced his crop for the year; the Honourable Member has asked you whether he should be free to sell it to anybody he pleases, and send it where he pleases, and you seem to intimate that it would be desirable that he should not be allowed to do that?—What I ask for is more, not less freedom. I do not propose to put pressure on him.

9933. Would you interfere in any way with the cultivator doing what he pleases with his crop; would you have the Government interfere, either by a general law or by the particular action of its executive officers, with the free disposal of the crop by the cultivator?—I would have the Government interfere not through its officers or through a general law, but by reducing the cost of administration.

9934. I wanted to get quite clearly what you would put before the Committee on this point?—I have put it as clearly as I can; that relief would be given to the conditions of life in India by England defraying part of the cost of the Indian administration.

9935. *Mr. Beach.*] We are on the question of revenue at present, not on the question of administration. I understand you to object to many or nearly all of the sources of revenue. We are dealing at the present moment with the land revenue as applied to the question. It is the land revenue particularly which you state compels the native producer to sell his produce from time to time as it is produced?—The land tax and the other taxes together; the land tax, of course, mainly.

9936. The land tax would be the only tax out of pocket for the native ryot, would it not; if he buys salt, for instance, he would only pay for the amount consumed?—But he has to part with a portion of his rice or barley or of some other crop which has itself displaced a food grain crop in order to obtain the salt.

9937. The land revenue, you think, is higher than it ought to be, and it presses rather hardly upon the people?—Yes.

9938. And that was in the permanently settled districts?—No; I excepted them.

9939. But I think to nearly all the other taxes you took exception; I think the Excise, the Customs, the Salt, the Opium, the Stamps, and Justice?—I spoke of the stamp duty as being too high, and in doing so I remember I did not answer correctly a question put to me by Mr. Grant Duff. He asked me whether we ought to withdraw from the administration of India, and I thought that I had indicated that opinion in reference to some of Mr. Fawcett's questions. I see that I gave that answer with reference to the stamp duty. I wish to explain what was on my mind at the time on the stamp duty. I was thinking of an argument used by Mr. Maine at the time when the Bill for imposing a rupee stamp on criminal suits was brought into Council. He said that it was necessary to impose a rupee stamp, because there were so many false complaints put in, and he described the failure of

Mr.
J. Geddes.
11 July
1871.

Mr.
J. Geddes.

11 July
1871.

criminal administration in Bengal, which he said would be remedied by a rupee stamp. It seemed to me to be an abuse of intellectual strength on Mr. Maine's part to argue as he argued against Mr. Stewart and Mr. Minchin. He said, among other things "We had better close the courts altogether." It seemed to me that the answer to that argument was, "Well, if your officers are unable to deal with false complaints so much as that, you had better withdraw altogether; but you should not make the failure of your magistrates a reason for making the administration of justice dearer." I spoke of stamps, and I thought, and I still do think, the stamp duties too high, not only in criminal prosecutions but in civil suits. About opium I have indicated my opinion. About the salt duty, I think that it is as high as it should be. From Customs I think there is no hope of increase; I have no objection to a Customs increase, but I think there is no great prospect of getting any great increase from the Customs revenue and the Excise revenue.

9940. Is it not with a view of inquiring whether they could be increased that I asked the question; but I thought you took exception to them, thinking that they pressed hardly upon the people?—No, the Customs certainly are among the last of the taxes which press; both Customs and the land tax are probably the very best forms of taxation for India. It is true that the merchants in Burmah often say that the Customs duty imposed upon rice bears very hard on Burmese produce, and on their statement it certainly does.

9941. Then you do not consider that it is absolutely necessary for the welfare of the people of India that these taxes should be sensibly reduced?—No, we cannot afford to lower the land tax and the Customs.

9942. I do not go into that question; but you do not think it is absolutely necessary for their welfare that the taxes should be greatly reduced?—No, I do not say that; I say that we should guard against greater taxation in the future.

9943. The question of expenditure is a large one; our expenditure you think is too large on many heads?—Yes.

9944. With regard to the English railways you said that the capital laid out, capital from borrowed money, tended to impoverish the country rather. Now as the capital is raised in England, and does not come from the pockets of the people there, or as nearly all is raised in England, it surely must be laid out in India for the benefit of the country?—About two-fifths of the railway capital raised is expended in England, and three-fifths I think of the railway money is expended in India. I should not draw the inference which you draw from the expenditure of the three-fifths of the railway capital. Not only I do not draw that inference but I know that it has not the effect which you suppose it to have in India; the capital is not invested with the natives at its own responsibility, neither do they get it absolutely; they are put under mortgage, under the necessity of repaying the principal; they are certainly at once put under the necessity of paying the interest whether the work is likely or not to pay ultimately.

9945. But when some millions of money are laid out there must be an enormous number of people employed?—Yes, there must be an enormous number of people employed, and then of

course a good many people will get very rich. You cannot transfer large sums in that way without enriching a great many people; but I think that the other people than those immediately concerned lose more than the whole of them together gain. I think that if the railway ends in a dead loss, if you have a million and a half loss to pay in guaranteed interest every year, your railways are a failure in the view of the people best capable of judging. If by any tariff for goods or for passengers which the Railway Companies under the control of Government can impose upon goods and passengers, they are unable to raise the working expenses of the railway and the guaranteed interest, the railway must be held to be financially a failure according to the opinion of the railway's own customers, the very best judges; and the country is put, to the extent of the difference, to a dead loss. So far from saying that the railways enrich India to the extent of so much a year, I should simply say that they entail a dead loss on India to the extent of a million and a half, or 1,800,000 £, or whatever may be the figures for the year. Nor does the evil end there; you disturb all the native industries by bringing the new capital brought in in this way suddenly into competition with the capital of the natives, and you disturb them in the arrangements which they would naturally make for enriching the country; that is another evil. A third evil is this: the sum which you require to send out of the country, a million and a half a year, if allowed to remain in the country would be employed among the natives at the rate of say 12 per cent., so that for a certain loss of 2 per cent., and an illusory expectation of getting 5 per cent., you put a million and a half of capital a year out of the power of improving at the ordinary native rate of 12 per cent. I put in some extracts from official minutes illustrative of what seems to me the hopelessly unremunerative nature of the Indian railways about which I spoke on Friday.

9946. What arrangements would the natives be likely to make for enriching the country?—The million and a half which they have to part with every year would be employed, certainly, in improving the country; native capital is very eagerly employed in improving it; the poverty of the country is not due so much to languor in applying the capital, as to the want of the capital; whatever capital there is in the country is applied eagerly towards useful work.

9947. I should like just to ascertain what kind of useful work it would be likely to be applied to?—The great thing is to cultivate more land; and it would be applied to cultivating more land; land is the chief object to which native capital is most willingly devoted.

9948. And you think that the amount that they spend in travelling by railways would be employed in cultivating the land?—No, I do not think that the amount employed in travelling on the railways would be spent in cultivation. What I say is this: the amount of loss incurred by the whole of the natives on the railway account, not the railway fares, but the difference of a million and a half of guaranteed interest; that amount would be put to more useful and more fruitful reproduction by the natives themselves.

9949. Then the railways ought to confer great benefit on them by reason of their produce being easily

easily carried by railway?—It has often been put that salt, for example, would be brought cheaper to them, that the salt tax would in effect be lowered by the lower freight upon the railway. That is very much like first requiring the people of London to take their water only from Dartmoor, and to pay an enormous duty on the monopolised water, and last of all making them pay the deficient dividends of the Great Western Railway, to make up the loss to the Great Western Railway shareholders, and calling that a compensation to the Londoners, or a cheapening of their water duty.

9950. *Mr. McClure.*] I think you said that the four and a half millions of bullion a year was required to make up the waste on the circulation?—The entire amount of absorption would be equal to an average of four and three-quarter millions sterling a year; but I said that Mr. Newmarch, a very competent actuary, estimating the hoards in India, and necessary for India at any time, at something like 400,000,000*l.*, thinks that 1*l.* per cent. would be necessary to replace merely the wear and tear; so that according to the opinion of a very competent actuary, you would have four millions alone representing not a new accumulation at all, but a mere replacement of loss by wear and tear.

9951. *Chairman.*] Is it your opinion that there is no more silver now in India than there was 65 years ago?—I am quite blank on that subject. Some people say there is, some say there is not; I have no definite opinion.

9952. *Mr. McClure.*] Could you suggest any plan for encouraging the commercial intercourse with Java and other places that you referred to, without interfering with the freedom of trade?—I am unable to suggest any practicable course.

9953. There is at present no advantage given, is there, to exports to English countries over exports to others?—I think there is; I think that if this country makes a tariff mainly for the benefit of English commerce, and the loss upon that tariff is charged to India, you cannot say that the question is an open one as between the two countries.

9954. But there is no export duty chargeable in favour of one country over another?—No, there is no overt preferential rate of duty at the custom house in either country; I think possibly the people who are rearing sugar in India would have something to say; they do say that the sugar trade has been injured in India by the high rates of duty imposed at the English harbours; they say that the sugar reared in India and imported into England is more heavily taxed in England than Manchester goods exported from England and imported into India.

9955. *Chairman.*]—Would the English or the Indians be the gainers or the losers by that transaction, do you think?—The sugar people would be the losers by that process, whether European or native; in India they are both European and native.

9956. Supposing that the tax on the sugar imported from India be the same as the tax on the sugar imported from all other countries, would they be the losers by it?—They say that they ought to have more than that; that their particular condition, and the great hardship of the sugar industry in India should be particularly considered, and that they should, in fact, have a preferential rate of duty in England.

0.59.

9957. *Mr. McClure.*] Have they imported sugar from Mauritius and other places into India?—They have imported sugar from the Mauritius into India. It is one of the saddest features of the Indian trade, that the manufacture of sugar should have so changed its seat, and that India should ever have had to import sugar from the Mauritius, while it formerly exported it to all the world.

9958. *Chairman.*] But when you speak of the import and export of sugar, are you not speaking of the export from Bengal and the import into the western coast?—Yes, mainly.

9959. Are you aware whether sugar can be produced on the western part of India as cheaply as it can be imported from any of the eastern countries through Bengal?—As a rule, I think it should; because there is no great life in the import trade of sugar from the Mauritius to Bombay. I do not think it a rising trade, and I imagine that on the whole whatever sugar is to be consumed in India is reared as favourably in India as it can be imported.

9960. But is not that question of whether the sugar is to be imported from Bengal into the western part of India, or imported from Siam, or from the Mauritius or China, if you please, merely a question as to whether it shall be imported from one place or another in consequence of its being very expensive to produce sugar in the western part of India?—That the decay in the sugar business is to be accounted for in some way or other, I do think.

9961. Is it not to be accounted for by the superior intelligence and knowledge of the subject now, and the people finding that they cannot make sugar in the western part of India so cheaply as they can get it from other places?—No; I think you must go further into the question than that to know why that should be. I think that part of the reason is, that sugar is a very elaborate crop; the ryot has to give a great deal of pains to it; I do not think he can do that very much while he is indebted. I think that the sugar crop is, more than the other crops, a crop of the indebted ryot. If, as I fear, the indebtedness of cultivators is on the increase, the number of ryots cultivating sugar would be on the decrease.

9962. Do you know whether it arises from the fact that the growth of sugar in India is the growth of an irrigated crop requiring a large course of irrigation, and that therefore the produce of such a crop as that is dearer than it would be in other places where it is produced under more favourable natural conditions?—Yes; but that does not explain why, having been obtainable formerly on comparatively favourable terms, it should cease to be so; why Bombay should be at a greater disadvantage in rearing sugar in later than in former years.

9963. Do you know whether it is at a greater disadvantage, or whether it has greater advantages from the facilities and improvement of commerce that have taken place in recent times in India?—I count it to be the greater disadvantage of India.

9964. You do not think that commerce in the East has been stimulated by the use of British vessels and other facilities for the great intercourse which India has with surrounding foreign countries?—I think that the statement that a large amount of sugar has been reared for consumption in Europe is certainly true.

3 O 4

9965. But

Mr.
J. Geddes.
—
11 July
1871.

Mr.
J. Geddes.

11 July
1871.

9965. But do you think that commerce has or has not been stimulated between the ports of India and the countries east of the Cape of Good Hope within the last 30 or 40 years by British enterprise producing a superior class of ships, and affording greater facilities for communication?—Yes; and if those only were the causes I should think it a matter of congratulation; but I do not think it a matter of congratulation that the labourers should leave the place where the cane was historically first grown, and should be deported under the Government arrangement to seek food in the Mauritius, and to rear a crop there which they might have reared at home.

9966. You think that if the land in the Mauritius will produce naturally, without irrigation, twice as much sugar per acre as the land in the western part of India will produce with the cost of irrigation, the people of India should not have the benefit of that circumstance, and, if they please, send their other agricultural produce to the Mauritius in exchange for this cheap sugar?—I think they should be able to please themselves in that way.

9967. And do they not please themselves?—I do not think that they please themselves. I do not think that it is under spontaneous action that they go to the Mauritius.

9968. Mr. R. Fowler.] You stated that former Governments of India had done more for the natives than the British Government has done; now have you any accurate information to found that opinion upon?—Yes, I have. Take the things which are usually said to have been done by the English Government, public works; if you look at them, you will find them of very little importance. The public works are the main argument on which the English are said to have benefited India.

9969. Sir C. Wingfield.] Surely the English Government have built a hundred bridges to where the native governments built one?—I daresay they have; but if they have taken the cost of it out of the natives, and the bridges do not pay; if the bridges have come down by the run sometimes, and the natives have had to defray the cost, I do not see that the natives are benefited. When I say that, I mean that they are not commensurately benefited. If you will turn to any statement of the expenditure by Government on account of Public Works in British India, for example, to the statement in the last number of the Statistical Abstract of British India (Parliamentary Blue Book 1870) Account, No. 49, which I put in (*vide* Appendix), you will find that the mere establishment takes up a very great proportion of the expenditure on Public Works. How does it necessarily benefit the natives to pay large sums to executive engineers (Englishmen) unless the executive engineers turn out works better and more extensive than they do.

9970. I should think that the proportion paid to executive engineers was a mere trifle to that paid to native workmen; is not that so?—The charge for establishment in that very last year figures at 1,012,451 £., and the total charge for Public Works is about 5,700,000 £. I think that a large per-centage for establishment, the charges for establishment being mainly European salaries. When I speak of establishment charges I take the figures from the Calcutta Financial Statement.

9971. Mr. R. Fowler.] Do not you consider that the great lines of India are a great benefit

to the people?—I have stated often that I do not think that the railways are a great benefit to the people; I think them a dead loss to the people. Returning to the examination of Public Works as set down in the Statistical Abstract, if you look at the statement of the total expenditure of 5,790,826 £., you will see that a large proportion of it is for repairs; the statement here for repairs is 1,162,035 £. against original works 4,628,791 £. And if you examine what these original works were, you will find that they were little other than barracks and gaols; so that a great proportion of the expenditure on public works is simply to keep going the mere machinery for Government, not adding to the wealth of the country.

9972. You spoke of the amount of indebtedness as regards the people of Oude; now does not money find its level, between Oude and Calcutta for instance, among the natives?—No, they are too far separated; money does not find its level in that way soon; you do not have the great money brokers of Calcutta transferring their sums to the little village loanmongers of Oude. It would not flow with the rapidity with which money would flow from Berlin to London, or in anything like the same ratio.

9973. Sir C. Wingfield.] Why do you suppose that there is a greater indebtedness among the tenantry in Oude than in any other part of India?—I do not say that.

9974. Mr. R. Fowler.] Is it your opinion that owing to the production of opium and indigo, India does not produce the amount of food required for the natives?—Yes; otherwise I do not see why they should starve.

9975. But would it not be your opinion that India could produce ample food for its population besides growing the amount of opium and indigo which it now produces?—Not under the present system.

9976. But with proper management do you think it would?—I do not think so, assuming the taxation of India to go on as before. In reference to that subject I should say that the population of India is, on the whole, a stationary one; that although celibacy among adults is very exceptional, the population is believed to be stationary. The recent census returns and the comparison of the settlement reports of the present time with those of a generation ago indicate a population stationary like that of France, rather than progressive like that of America. The question is a moot one, but the bulk of the official evidence points to the population being a stationary one.

9977. Mr. Lyttelton.] I gather from your evidence that in your opinion the failure of our Indian Administration is almost entirely due to the fact, that India is governed by a foreign and distant power?—Partly owing to that, but chiefly owing to the difficulty with which a Western Power taking over the duties of an Eastern Government can work through native institutions, especially the religious institutions.

9978. But that difficulty is one inherent in our Government, I am afraid?—Yes.

9979. Do you conclude from that, that our administration cannot be advantageous to the people of India unless the expense of it is in a great measure defrayed by the people of England?—Unless it is to some extent defrayed by the people of England, certainly.

9980. And you think that no economy on the one hand, and no improved system of taxation on the

the other, would strike at the root of the evils that you have been speaking of, that they would only, in fact, palliate them?—They would only palliate, and not remove the evils.

9981. Then you think that unless much of the cost of the Indian Government is defrayed by the British taxpayer our only other alternative is, that we should throw up our task, and leave the country?—Yes, only I demur to the throwing up of the task; I think that we have no business to undertake a task, and throw it up at our own pleasure, leaving the country in anarchy.

9982. What would you do to prevent that; have you ever considered the difficulties of terminating our connection with India?—I have considered them often and long. On the one hand there would be a very obvious difficulty in getting money in a country like England, already highly taxed, to carry on a Government so distant and inevitably so expensive; it would be impossible, for instance, to do so without, to some extent, injuring the English working classes, of whom I spoke; but it is a question of degree very much with regard to them and with regard to the richer classes in England. The question is rendered still more difficult, because the very idea of withdrawing from India itself weakens our power so very greatly. The attitude of the political officer always must be, and according to official record is, that we can allow no equal with ourselves in India. The difficulty is in fact everywhere very great, but something might be done. Wherever there is a Mysore, wherever it is possible to reconstruct a native government, to do so, and eagerly to hold on to every native institution, especially every political institution, we ought to avoid the foolish commercial missions such as have occurred in recent years to other countries, and we ought on every account to avoid embroiling ourselves in frontier disturbances. Of course all that is very difficult. It is very difficult to intimate that we are preparing to withdraw, and at the same time to continue to hold the prestige which we have hitherto been expected to wield.

9983. In regard to the enormous British interests in India, are you of opinion that unless such a programme as you have sketched out is followed, the charges of them should be borne by the British taxpayer, or that they should be charged upon the native governments that we should set up?—As many of them as we can get the native governments to take over, and as we can ask them fairly to take over, should be made over to them certainly. Part of them no doubt would have to be met by ourselves and adjusted by ourselves. The mode in which we should withdraw would of course very much govern the extent to which we could apportion the liabilities. A violent withdrawal means a cancellation, so far as India is concerned, of all the mortgages that we have against her; a peaceable withdrawal means otherwise, and that is one of the advantages, as well as the duties of a peaceful withdrawal; a peaceful withdrawal of course prolonged over a long sequence of time.

9984. Mr. Eastwick.] I should like to ask you a few questions as to facts. You have stated here "My impression is that famines have been on the increase under British rule;" now, I want to know what facts you know to justify that statement. In the first place, what famines do you know that have taken place under our rule; and in the second place what famines that have

0.59.

taken place under the native rule?—I know nothing more than I know from personal inquiry among the people of Orissa, and some of the districts of Bengal, and from a careful study of the entire literature available on the subject.

9985. That is to say, you have read all the Mahomedan histories?—No, I have merely read the ordinary histories, Elphinstone and all the others.

9986. Will you state what famines you know which have taken place under our rule, mentioning the years?—One mode of reasoning on which I proceeded is simply by examining the statements made by our official apologists, that famines are less frequent under our rule.

9987. I ask what famines which have taken place under our rule are you acquainted with, and what are the dates?—There is, first, the famine of 1770.

9988. Why would you call the famine of 1770 a famine that took place under our rule, seeing that we had only just at that very moment acceded to something like the government of the country?—It is a famine that took place partially under our rule. The famine of 1770 took place two years before the accession to "the Dewanee."

9989. You do not ascribe it to our rule, do you?—I do partially ascribe it to our rule, though I do not think that it was so serious as our historians make out. I say that we had something to do with it, as we were taking a large amount of money out of the country. Burke's Report of the Ninth Committee, from which I quote in this Memorandum, and all the accounts that we have of Bengal in the time of Warren Hastings tell us how very important an influence the English Government had at and before the Dewanee on the social condition of the natives.

9990. You must be aware that you stand almost single in the idea that that famine could possibly be owing to our rule, seeing that we had only just acceded to the administration of that part of the country?—I have already stated that, among the many antecedents that lead to famine, the influence of the British Government is one. I call it the most important antecedent, because it is an antecedent which is variable by human will.

9991. Will you state the other famines?—1783; that was mostly a North-West famine, but it was also a Bengal famine. Then the famine of 1837, which was very severe in the North-West, and had some severity in Orissa; then the famine of 1860 and 1861; and then the famine of 1866; and the later famines; the scarcity, almost famine you may call it, of 1868; then the very severe famine of 1869, throughout Northern India.

9992. In 1869 it amounted to a famine, did it?—Certainly, and with very great mortality. The necessity of dealing with that famine was one of the things which very greatly aggravated the deficits of the two years 1868 and 1869. When you speak about my being singular in my opinion, I quite admit that I am singular, that I am peculiar in my opinion. I think it right to tell the Committee so, and not to seem to be putting an opinion which is peculiar to myself as if it were held generally by officials.

9993. You have stated four famines. Will you allow me to ask you in return if you have ever read the history of the Mahrattas by Grant Duff?—No, it is very difficult to get a copy.

3 P

9994.* In

Mr.
J. Geddes.
11 July
1871.

Mr.
J. Giddes.

11 July
1871.

9994. In page 59 in that book I find, "In 1396 the dreadful famine, distinguished from all others by the name Duga Dewi, commenced in Maharashtra. It lasted, according to Hindoo legends, for 12 years. At the end of that time the periodical rains returned, but the hill districts were entirely depopulated, and a very scanty revenue was obtained from the territory between the Godavery and Kistna for upwards of 30 years afterwards?"—I have heard of that; that is amply quoted from in Mr. Girdlestone's memorandum on past famines in India, and other recent official memoirs.

9995. You admit its extreme severity?—Yes; but as to a famine in the sense of famine, such as wasted Orissa in 1866, I maintain that no society, whether Maharratta or any other, could have survived 12 years of such disaster. It is necessary to observe the very wide range of significations attaching to the word famine; for as the Orissa Commission has pointed out (Appendix H.) the word is sometimes used to denote mere scarcity and dearth, involving only hardship with considerable, inconsiderable, or no mortality; sometimes to denote the direst want with overwhelming mortality. This famine of Maharashtra must have been famine in the former sense.

9996. Have you heard of the famine in 1471?—Yes.

9997. Have you heard of the great famine in 1631, in the reign of Shah Jehan?—Yes.

9998. Have you heard of another great famine in 1661, which you will find stated at page 342 of the Report before you?—Yes; I believe that in this Report all that is known about the famines, or the substance of all that is known about them, is stated.

9999. Then there is the famine of 1770 (which in my opinion was entirely a famine under native rule, and not under English), in which case there would be then five very great and destructive famines, called historical famines, which raged over a great part of India before our rule began?—Yes, that is so. I demur however to being supposed to hold the opinion that we were not in any way chargeable with the famine of 1770, when among the records of that time you find the famine alleged to have been aggravated by the Company's officers forestalling and aggregating grain.

10000. That was aggravating, not occasioning, the famine. Now, with regard to the extent of that famine, you demur to the statement of Dr. Hunter as to the number of persons who died, namely, 10,000,000?—Yes.

10001. And the reasons that you have stated were of this nature, that you did not believe that it was consistent with the character of Warren Hastings to tax people who were suffering so severely?—To tax so severely people who were suffering so severely.

10002. Are there any other reasons which you can state?—Yes, among others, I would mention such as this: Dr. Hunter describes, in his graphic way, how the people died. He says, "Millions of famished wretches died in the struggle to live through the few intervening weeks that separated them from the harvest, their last gaze being probably fixed on the densely covered fields that would ripen too late for them." That seems to me a strange mode of reasoning; surely people would not have sown the normal quantity; surely people would not have sown the great quantity such as would have ended in the cheapness which Dr.

Hunter describes, had their stock been so very short; they would have certainly eaten a part of the seed grain, and have trusted to the chance of accidents for the following months, had they found themselves really in danger of being anything like a third of their numbers.

10003. However, it is distinctly stated, is it not, that, in spite of the great distress, they did add 10 per cent. to the revenue?—Yes.

10004. Now, you have stated your belief in the fact that famines are more common under our rule than they were under native rule; I wish to know why you think so; why should it be so?—Natives ordinarily say so; they tell you that famine is one of the things which came in with our rule.

10005. That, of course, is a mere superstitious opinion, but I want to ask your reasons?—Many of the reasons which are given on the other side by our official apologists are superstitious opinions; I have here Mr. Girdlestone's memorandum on famines; I think his reasoning as superstitious as that which you have attributed to the natives.

10006. I wish to know what reason you can give why there should be more distress under our rule than under native rule?—I accept the native opinion as a thing to be considered, and I decline to set it aside as a superstitious opinion any more than I do Mr. Girdlestone's opinion, merely because it happens to be superstitious.

• 10007. You simply base your opinion on the opinion of natives?—On the opinion of natives tested by the opinion of Europeans.

10008. You have no reasons to give of your own; have you said anything about the state of the communications?—Yes; that is one of the features that I wish to speak about. The expectation has always been that improved communications would decrease the chance of famine. Have we found it so? Colonel Baird Smith said that the distress by famine in the North-West Provinces would be very greatly alleviated, partly by the permanent settlement and partly by improved communications. The permanent settlement has not been completed; but the communications have been improved, yet famine has not disappeared.

10009. Had communications been improved in Orissa when the famine of 1866 took place?—Orissa was an outlying province certainly, but it had harbours and was able to dispose of its produce. Then touching the North-West and the effect of railways, the native opinion is that the railways have rather drawn from the reserves of food.

10010. Will you let me apply that reasoning to a neighbouring country, Persia; there are no railways in Persia and communications are difficult, and we know as a positive fact that the destruction caused there by famine is very great?—I thought at once of that on hearing of the famine in Persia, and I watched carefully for the accounts to see whether it was not time for me to revise my opinion, whether I had not drawn erroneous conclusions from the facts. I have not seen reason to do so. There would be famine in Persia under native rule, just as there were famines in India before our rule.

10011. But there you have the case of a country with bad communications, with a light taxation, and with a revenue collected in kind, and yet you have dreadful mortality, equal to our mortality. Would you say that our communications increase the mortality?—I am not aware that

that the mortality in Persia is equal, to our mortality in India. I have watched for the statistics, but have never been able to find any, or any reliable account which would take the place of statistics, and which demonstrate mortality in Persia anything like to the mortality of an ordinary Indian famine.

10012. As we are speaking of statistics I would ask how you can support that observation that you made with regard to the population of India remaining stationary? Are you speaking of the whole of India, or are you speaking of some particular points?—The statement is mostly based on the statistics of the north-west. I have thought over the question myself, in Orissa, and I speak from information tabulated more carefully in the north-west.

10013. But do you speak at all now of that part of India as compared with the Madras and the Bombay Presidencies?—No. I can only speak of them with what light the knowledge of native institutions in Bengal and Orissa will throw on Madras and Bombay. But I was very much surprised on first hearing the statement mooted that the population was, on the whole, stationary, and I demurred to it for awhile.

10014. But you have no positive facts, have you; there has been no census taken from time to time for a century, which could prove that?—No, there has been no census like our own decennial census for completeness; there have been census returns of much value, especially in recent years, for example, those of Oude reviewed by Mr. Williams, more of the north west, reviewed by Mr. Plowdene, also those of the central provinces, and the partial enumerations in Lower Bengal.

10015. What are the dates of these census returns?—I cannot quote the particular figures; I merely state the general purport.

10016. But I should like to have had the exact date of these census returns?—I think they were a generation ago, at the time of Bird's settlement in the north-west, and tested by the general census of 1865.

10017. But that would only refer to the North West Provinces?—Yes.

10018. Then, after all, you can only justify your assertion by very partial reference to the North West Provinces, which, after all, are but a very small part of this immense country?—I put the statement forward as subject to correction.

10019. Sir C. Wingfield.] There was no enumeration of the population at Mr. Bird's settlement?—The officials who revised the later census speak of the earlier census, the enumeration at the time of the settlement.

10020. There was no regular enumeration of population?—There was a statement of the village produce and of the village cattle, and so on.

10021. Mr. Eustwick.] To pass from that point, I do not remember exactly what you said about the loss of bullion yearly. Did you say that there was 4½ millions of bullion lost yearly by attrition?—That is Mr. Newmarch's estimate, by abrasion, by every form of misadventure, people dying, and traces of their hiding holes being lost.

10022. I would ask, if that is the case, how it is that in Persia, for instance, where the whole circulation is not, perhaps, above 10 millions, in the course of some 30 or 40 years, the coin does not disappear altogether, if that per-centage is 0.59.

lost every year; but, of course, it is a mere estimate?—It is a mere estimate. Mr. Newmarch possibly estimates the per-centage for the wear and tear too high; but still, with all allowance made, the accumulation of silver in India is nothing like what it is generally made out to be.

10023. I would like to ask you one question with regard to the great spiritual influence which you suppose the heads of caste have in India. I think you said that they could put a stop to the growing of opium, and to the usage of intoxicating drugs in liquors?—On that Question 9714, I wish to state that I did not hear the last part of Mr. Ayrton's question, and therefore my answer, "Yes," would not apply to the latter part of the question.

10024. It is the fact, is it not, that even the religious men amongst the Mahomedans are in the habit of taking bhang and other intoxicating drugs?—No; not religious men, certainly not.

10025. That is contrary to my experience. At all events, if not the religious men, it is the fact that the highest men in the country do take these drugs; that you are aware of, I suppose?—Many do, certainly.

10026. And that they did do it before we came into the country?—Some did; not so many as now.

10027. You seem to think that, if a person commits an offence, and is put out of caste, he cannot regain his position by money?—Certainly not merely by money; he must conciliate the brotherhood.

10028. He must give a dinner, in fact?—He must give a dinner; he must make a submission according to the religious institution.

10029. But you are aware, are you not, that it is the fact that the most immoral offences are condoned by caste dinners; is not that the fact; the caste meets, and a dinner is given, and the offender is received back?—Yes, after due compliance.

10030. Mr. Grant Duff.] You have told us that you wish for as speedy a liquidation as possible of our Indian concerns, and you gave us a brief sketch of the policy which you would recommend for that purpose?—I indicated it generally; it was merely in answer to a particular question as to all the difficulties in the way.

10031. But, when all is said and done, have you no more advice to give us than that when we happen to have a case like Mysore, we should act precisely as we did in the case of Mysore; that we should discourage the visits of Government officers to dangerous countries, as Lord Lawrence did in the case of Johnston's visit to Khotan, or the survey which it was proposed to push into the Shan States; and, further, that we should respect native political institutions, and be forbearing and indisposed to aggression on our frontiers, as a very great number of our officers are now. Have you anything more to say in the way of advice?—No.

10032. If we only do what you have suggested, should we take less than a thousand years to liquidate our Indian concerns do you think?—I included on the former occasion defraying part of the taxation out of English revenue.

10033. By that do you mean to say that there should be every year voted in the estimates a sum out of the English taxes for a subsidy to India?—Yes.

10034. Would that be fair to the English working

working class of which you spoke the other day? —It would be partly hard upon them; I do not think that it would be so hard on them as the present system is; I think that it would only be done under an impulse of a duty such as of itself, would get over many of the difficulties with the working classes. I think also that the taxation required in England should fall mainly on the rich classes in this country, so as to be retrenched from luxuries, and not on the working classes to make life harder for them. This would be the more reasonable, because it is the richer classes who have acquired and held India for their own benefit.

10035. But then you told us the other day that the working classes in this country would presently object to capitalists sending capital to India, even if they thought it a good place to send it to?—Yes, I think that is a serious difficulty in looking on to the future, I fear that we may have to deal with a Delescluze in London, as well as with nawabs in India.

10036. But still you think that they would not object to an appropriation of the money of the British taxpayer to subsidise India?—I think that with a proper appeal to them they could be got to agree to it.

10037. Could you refer us to any writings either in the present generation or in the past of persons who take your gloomy view, or anything like your gloomy view, of our prospects in India?—I think that Mr. Campbell, the present Lieutenant Governor of Bengal, whom I shall serve after a few months, takes a view quite as gloomy, or nearly as gloomy, as I do of Indian finance; there is an article in the "Quarterly Review" generally attributed to him, in the last January number, to which I refer.

10038. You think that the views in that article are quite as gloomy with reference to India as yours?—Yes, nearly.

10039. Mr. Lyttelton.] Does he regard the increase of the income tax as trustworthy and advisable?—No, I think he trusts more to local taxation as supplying the want.

10040. Mr. Grant Duff.] Supposing that we determine not to accept your advice, but to retain India as long as we can, have you any suggestion whatever to give us either for the increase of our revenue or for the diminution of our expenditure?—I have nothing further to suggest beyond what you call my advice, but which were really special answers to special questions.

10041. You have nothing to suggest beyond a subsidy out of the taxes of England?—No.

10042. Sir C. Wingfield.] You said that you dissented from the theory on which irrigation works are constructed, that they save the land revenue in time of famine, because, if the land revenue requires to be saved, it is too high. Now, famines in India usually proceed from want of rain and consequent absence of production; if the land revenue were reduced to a quarter of its present amount, still, if nothing were produced from the soil, the effects of famine on the population would not be mitigated, would they?—I think they would; less food would be depleted at the harvest than according to the present demand, because, immediately on the harvest, as soon as the crops are ripened, that process of sale for exportation aggravates the difficulty; all the produce of the market is thrown on the market at

once, to enable the cultivators to meet their autumnal instalment of land tax.

10043. But the food reserve would not be affected by the circumstance of the revenue demand being higher or lower; you assume that there must be reserves in the country?—That there ought to be reserves, in order to meet the vicissitudes of the seasons.

10044. But then the Government demand cannot have much effect upon the condition of the people when once a famine takes place; a famine could not be prevented by reducing the Government demand?—I think a famine is a process; it is not an event. I think that a famine could be alleviated by the action of Government, and I know that suspending the land revenue is one of the chief resources of the Government to mitigate the famine.

10045. It is a resource adopted not merely to mitigate a famine, but because from a poor peasantry you cannot get the revenue; you speak of one of the conservative customs of the natives being to provide stores of food against a bad year; now, was not one main cause of much grain being stored up in old times the impossibility of selling it owing to the want of roads to carry it to a market?—No doubt that did act. Some now may sell partly under compulsion; many, of course, sell voluntarily.

10046. Have you heard that shortly after the annexation of the Punjab there was great alarm that the settlement would break down owing to the excessively low prices of grain consequent on abundant harvests?—Yes, I remember that; and I remember a Minute of Lord Dalhousie's, in which he spoke of England getting wheat from the Punjab at possibly 20s. the sack. That expectation has received ample and miserable confirmation in the chronic dearthness of food throughout the Punjab, culminating occasionally in the direst famine.

10047. Is it not the case, that though a province may no longer keep reserves for itself, it can draw them from the neighbouring provinces, so that still in the aggregate there would be the same amount of reserve of grain in all India?—No; I think that if the amount exported varies under variable policies of Government, the food reserves would likewise alter.

10048. But is it not the case that in the more recent famines the grain poured in quantities into the famine stricken districts, owing to the improved communications?—Yes.

10049. You have read Colonel Baird Smith's Report, and you will recall, perhaps, that he describes the difference between the famines in the North West Provinces in 1837 and 1861; he says, that in 1837 food could not be obtained at any price, owing to the difficulty of sending grain to the afflicted districts from the want of communications, whereas in 1861 when communications had greatly improved, the grain poured in from all quarters, and all that was wanted was money to buy it; money was deficient from the stoppage of agricultural wages during the two bad seasons, when the land could not be ploughed; therefore, if communications serve to take grain out of the country, they also serve to bring it in?—Yes, they do; but I think Colonel Baird Smith insists very strongly that the famine of 1860-61, was more severe than the famine of 1837, to which you have alluded.

10050. But he certainly alludes to this, that in 1861 there was grain, and that the only want was

was money; whereas in the former famine, money could do nothing, because the grain was not to be had?—Well, I do not see how the people would have sold away their crop of 1859, or 1860, or the year of the drought if they had had so very much money; some may have had money, and others not.

10051. But when you say that people now are obliged to sell their grain to pay their land revenue, in all periods the land revenue could only be paid by disposing of the surplus produce?—Yes; but that same surplus produce would form a very different provision according as the land tax was payable in kind, and as it was payable in money, according as the surplus produce represented the residuum of crop left after paying a land tax, varying in amount with the varying yield of the harvest, and according to the surplus produce represented, the residuum left after paying a land tax of fixed money-value not varying with varying yield of the harvest.

10052. If it was paid in kind then the Government who collected it in kind must sell it, must they not?—But, under native rule, the grain so parted with remained still in the neighbourhood, and the people who obtained it in the neighbourhood passed it into local consumption under the use and wont, the customary ideas of the neighbourhood.

10053. (*Chairman.*) Would any more remain in the neighbourhood than the people in the neighbourhood wished to consume; would not the rest be exported beyond the neighbourhood. Supposing the Government took the revenue in kind, would they keep any more in the neighbourhood than the people wished to consume; would they not sell the surplus?—The services performed by officials resident in the neighbourhood would be paid for by grain available for consumption in the neighbourhood.

10054. But would they not have to sell the grain that they did not want for the purpose of buying all the other necessities of life?—They would part with grain for that purpose, and in doing so would feed the neighbours who under our system would starve.

10055. But would not the operation be, that as they want a great many things more than corn, they would sell all the corn except that which, if they chose, they might keep for their own mouths; must that have been the operation?—Yes, it would be the operation.

10056. Now the operation is, that instead of the officers of the Government taking the grain and selling it, the man who raises the grain sells it wherever he thinks fit, and pays out of it a less sum in money than he paid in kind before; is not that the present operation?—No, I think it makes a great difference whether the payment and consumption take place wholly on the spot or partly at a distance.

10057. You see that the man sells his grain now to somebody else instead of giving it over to the Government, and inasmuch as the Government takes less now than was taken formerly, he, as the agent for sale for the Government, sells less than he sold before, that is to say, as far as the Government demand is concerned, he sells less than would have been sold before; is not that so?—Under our system, no.

10058. Let us examine that; we have had abundance of evidence here that the Native Governments took half the crop in kind, and we now find that the Government is taking what is estimated to be one-sixth of the value of the crop in coin?—I have never found it stated that Native Governments took one-half of the crop. An assessment so very severe cannot be attributed in that absolute fashion to the Native Governments.

10059. Without going into the absolute fractions, it has been clearly shown that the quantity, which former Native Governments took in kind, bore a greater proportion to the whole crop than that which is now taken in money bears to the whole money value; do you admit that rate to be correct?—No.

10060. Then you differ from all the views which have been expressed to us on official records as to the comparative demand which is now made, and that which was made by the Native Governments before we assumed the Government?—I do not think you will find that to be the statement on all the official records; for example; if you take the most accessible one, Mr. Campbell's Essay on Land Tenure in the Cobden Club Volume, I do not think you will find that he says that the natives took half the produce.

10061. That is not an official document?—It is a document by an official.

10062. Everything that you write in a pamphlet, you do not call an official document, do you?—No. If you look strictly at the native official documents from which Mr. Campbell has compiled, you certainly will not find that a half of the produce was taken. If you refer to Mewn or to the Ayeen Akbari, you will find that it is a very small proportion.

10063. We have been endeavouring with you to confine your evidence to the state of things immediately before the British Government assumed its rule in India, and before it was changed by British rule; do you doubt the evidence given, that at that time the demands on the cultivator bore a greater proportion to the whole produce than they do now, the produce then being taken in kind, and now being valued in money?—I disagree with that statement, and I tell you that in verifying that, I go to the official records of Native Governments which preceded us.

10064. But is it correct to speak of the Ayeen Akbari, and treaties of that sort, as being official documents?—Those contain the principles on which the Government was carried on immediately before us, just in the same way as the principles of English rule in England are those of Coke upon Lyttleton, and Blackstone.

10065. We are endeavouring to direct your attention to the practice, not to the principles; the Institutes of Munu would give no information as to what was going on before the British Government was established; we want to direct your attention to what was going on then; do you doubt the correctness of the evidence given on that point?—I am not aware that the evidence is in the direction which you state.

Mr.
J. Geddes.

THE RIGHT HONOURABLE ACTON SMEE AYRTON, IN THE CHAIR.

Mr. WILLIAM THOMAS THORNTON, re-called; and further Examined.

Mr. W. T.
Thornton.
14 July

10066. *Chairman.*] I THINK you have stated that you hold the office of Secretary in the Public Works Department of the Secretary of State for India in Council?—Yes.

10067. Will you be good enough to explain upon whose advice generally the Secretary of State for India in Council proceeds in making arrangements for the construction of railways or other public works by joint-stock companies?—That is a very difficult question to answer. I think I can only answer it generally by saying that he acts upon any advice which he either invites or which has been tendered to him.

10068. Advice which may be deemed suitable to the occasion?—Yes.

10069. And does he, when he considers it necessary, refer to the Government of India for their opinion, or to the local government before acting in the matter?—I should think that in almost any case he would refer to the Government of India; of course if he does not do so, he refrains from doing so on his own responsibility.

10070. Can you state in the particular case of the Malta and Alexandria cable, upon what advice, and under what circumstances, the Secretary of State acted in his first transactions with reference to the Malta and Alexandria line of telegraph?—In order to make it clear, I will begin a little before that; I find that in April 1859 Lord Stanley, being then Secretary of State, proposed to the Treasury to lay down a cable between Rangoon and Singapore, at the joint expense of the English and Indian Governments. The division of expense was to be on the principle of one-half to each, if Singapore remained under the control of the Indian Government; but in the event of Singapore being transferred to the Colonial Department, as it was then in contemplation to do, and as has since been done, the share of England was to be two-thirds, and that of India only one-third. This letter was written by the India Office in April 1859; the Treasury did not reply till November; I should mention that in May, that is to say, a month after Lord Stanley's letter was written; the

Treasury had come to the conclusion to lay a cable between Falmouth and Gibraltar at their own expense, and they had this cable ready in November, but they then began to doubt whether it would be very wise to lay it between Falmouth and Gibraltar, and, therefore, in November the Treasury, in replying to the India Office letter of April previous, says that it is willing to join with the India Office in laying down a cable between Rangoon and Singapore, provided that the India Office is willing to take for that purpose the cable which the British Government would have laid down between Falmouth and Gibraltar. There might have been some little correspondence in the interval; but in April 1860, Sir Charles Wood, then being Secretary, agreed to this on condition that India's share of the expense shall only be two-fifths. Then arrangements were made for laying down this cable between Rangoon and Singapore; but, after a while, this cable having been partly shipped, was found to be heated. I do not suppose the Committee want to know in what way it became heated; it is all given in detail here; but the fact is that it did become heated, and it was then determined that it would not be safe to send it out to Rangoon, and that the expense of keeping it in England, considering that part of a season at least would be lost, would be very great, and on that account the India Office, Sir Charles Wood being still Secretary of State, proposes that this cable which had originally been made for the purpose of being laid down between Falmouth and Gibraltar, and which was now to be transferred to Rangoon, instead of being laid down there, should be laid down somewhere else, somewhere nearer home; and then the Treasury, in reply, propose that it should be laid down between Malta and Alexandria. Sir Charles Wood wrote, in reply to the Treasury, on the 20th September, stating, as follows, the conditions under which he was prepared to agree to the Treasury proposal. "In regard, however, to the mode of adjusting the expense, Sir Charles Wood considers it necessary to advert to the correspondence that has already taken place between Her

Her Majesty's Government and the Indian authorities on the subject of the principle which should be observed in apportioning between the Indian and the Imperial treasuries the cost of establishing telegraphic communication between Malta and India. He begs to draw the attention of the Lords of the Treasury to the accompanying extract from a letter from the late Court of Directors to the Board of Control, in which this principle, that had before been recognised, is maintained. The Secretary of State in Council is prepared to follow the course thus indicated, and to bear one half of the expense of the cable now to be laid between Malta and Alexandria, upon condition that the cost of the Persian Gulf line is also equally divided; or, if considered preferable, the Government of India will undertake the construction of the whole of the Persian Gulf line at its own cost, provided the British Government will pay the expenses attending the manufacture and laying of the present cable in the Mediterranean." The Treasury replied to that on the 28th of December, and, in reply to their letter, Sir Charles Wood "entirely concurs with the Lord of the Treasury as to the expediency, under existing circumstances, of transferring to the Malta and Alexandria line the cable which was originally destined to connect Falmouth with Gibraltar, and afterwards Rangoon with Singapore. He also agrees with them in regarding the proposal of Messrs. Glass and Elliott, submitted in their letter of the 20th ultimo, as one that may be accepted, provided the Board of Trade are satisfied that a greater depth than 100 fathoms will not occur in the proposed route from Malta to Alexandria." Then he goes on to say, "It was not, I am directed to add, Sir Charles Wood's intention by the remarks contained in my letter, to suggest a suspension of any of the arrangements which their Lordships had desired to be made for affecting the transfer in question; but, after referring to former correspondence on the subject, he considers it desirable, in order to avoid future misunderstanding, to advert to the principle upon which it was understood the apportionment of the expense of telegraphic communication between Malta and India should be made. This question can, however, as their Lordships desire, remain for consideration; all further payments by this office on account of the cost of the present line being suspended until it is settled." I have omitted to read the important letter from the Treasury, in which they concur in that arrangement. If the Committee will allow me, I had better refer to it, because it is very important. It is a letter of the 28th of December, in reply to the proposal of the India Office: "Sir, I have laid before the Lords Commissioners of Her Majesty's Treasury your letter of the 20th instant, and its inclosure, relative to the appropriation of the Rangoon and Singapore cable for telegraphic communication between Malta and Alexandria, and I am desired by my Lords to state, for the information of the Secretary of State for India in Council, that my Lords presume that the question of division of cost will remain for after discussion, but that their Lordships have received no intimation that Her Majesty's Government had intended or proposed any change in the distribution of the cost, and that they have no more, therefore, to do on the present occasion than to inquire whether the President of the Board of Trade may be autho-

rised to understand that he has the consent of the Secretary of State in Council for his proceeding to consider of new arrangements, or whether Sir Charles Wood may be desirous that the matter should be suspended, at whatever hazard or damage to the cable, until the whole subject with respect to the cost shall have been re-considered; a subject which may be found to open a somewhat wide field." I regret that I had put these letters in the wrong order, but the real substance of them is this, that when the Indian Office agreed that the cable should be transferred from the Rangoon and Singapore Line to the Malta and Alexandria Line; they did it on the understanding that the question of division of cost should remain for after consideration, to which the Treasury agreed. Then comes, on the 11th of February 1861, this letter from the Treasury: "I am commanded by the Lords Commissioners of Her Majesty's Treasury to request that you will again bring to the notice of Sir C. Wood, the letter from this Board, dated 14th December last, and the accompanying statement, which showed that 58,311 *l.* 14 *s.* 10 *d.* was then due from Indian revenues on account of the payments made by the Paymaster General for the Rangoon and Singapore Telegraph. I am to state, that several payments of considerable amount have since been made for the same service, two-fifths of which are recoverable from Indian revenues; and that as the money provided by Parliament under this head was a net sum, amounting to three-fifths only of the total disbursements anticipated, there remains at the present time no balance of the grant from which any further payments for the same object can be made. The Secretary of State for India will therefore see that it is imperative upon this Board to press for an immediate transfer from Indian funds to the amount of the claim made in December last, in order to enable them to meet the liabilities incurred towards the contractors." To which the India Office makes the following reply: "I am desired by the Secretary of State for India in Council to acknowledge the receipt of your letter, dated the 11th instant; and in reply, to request that you will remind the Lords Commissioners of Her Majesty's Treasury that when it was arranged that the Rangoon and Singapore cable should be transferred to the line between Malta and Alexandria, the question as to the principle upon which the cost of the work should be apportioned between Her Majesty's and the Indian Governments was left for consideration, upon the understanding that 'all further payments by this office on account' thereof should be 'suspended until it' (the question) 'is settled.' I am accordingly desired to state, that before ordering the payment of the sum of 58,311 *l.* 14 *s.* 10 *d.* now asked for, Sir Charles Wood requests to be informed whether their Lordships will agree to the arrangements adverted to in Mr. Merivale's letter of the 20th December last, viz., that the cost of the cable now under notice, and of that which may be made for the Persian Gulf, be equally shared by the revenues of this country and of India, or that the whole cost of the Mediterranean portion should be borne by the one, and the whole cost of the Persian Gulf line by the other." To that the Treasury reply on the 25th of February: "I am desired by the Lords Commissioners of Her Majesty's Treasury to request, with reference to your letter of the 16th instant, that you will state to the Secretary

1871.

of State for India in Council, that my Lords feel it impossible to acquiesce in the proposal for postponing all further demands on the India Office for their proportion of the expenses attending the construction of the telegraph cable between Malta and Alexandria. These demands are in accordance with the agreement concluded between my Lords and the India Office, when the adoption of the Rangoon and Singapore line was settled, and my Lords must remind the Secretary of State that the alteration in regard to the destination of the cable intended for this line, was made with the full concurrence of the India Office, it being obviously as much for the interest of the one department as of the other. It was not a mere project of the Government for the establishment of a Mediterranean line, but was proposed as the only means of averting a very heavy loss, which would have affected the two departments in common. It entailed no expense on the Indian Revenues, which had not been foreseen (and, it is to be presumed, provided for). It involved no change in the terms of the contract, so far as pecuniary liabilities are concerned, the payments under, which must have been continued under any circumstances, whatever might have been the fate of the cable. In the estimate voted last year, a deduction was made on account of that portion of the cost, which under the before-mentioned agreement, was to be made chargeable on Indian Revenues; the whole of that vote has been exhausted, and a further sum of 28,000 £. has been borrowed from the vote for civil contingencies, in full reliance on the good faith of the Indian Department in meeting its engagements. It will be necessary, shortly, to make further payments, which cannot possibly be deferred without a forfeiture of the contract, and a consequent increase of expense. With regard to the question of the Persian Gulf line, my Lords must protest against its being in any way mixed up with the question now before them, or being admitted as a plea for deferring their unquestionable claims for the repayments demanded. My Lords trust that the Secretary of State for India in Council will, on consideration, see the justice of this claim, and will take immediate steps for at once meeting it, as much inconvenience has already been felt in consequence of the delay, and it will be impossible otherwise to provide for the further expenditure accruing under the contract." To which the Secretary of State, Sir Charles Wood, makes the following reply on the 28th of February 1861: "Without concurring in all the remarks contained in your letter, Sir Charles Wood will not offer any further objection to the payment to the Treasury of the sum of 58,311 £. 14 s. 10 d.; on account of the proportion to be borne by the Indian Government of the expenses attending the construction of the telegraph cable between Malta and Alexandria."

10071. What took place after that?—Then, that being done, the cable was laid between Malta and Alexandria, and leased to Glass and Elliot, I think, on the 4th of June 1861; Glass and Elliot's Company subsequently becoming the Telegraph Construction and Maintenance Company, and so it went on until January 1871, when the Treasury, without consulting the India Office, sold the cable to the Anglo-Mediterranean Telegraph Company.

10072. Sir C. Wingfield.] The Anglo-Mediterranean Telegraph Company had previously

rented it of the Government, had it not; it worked that cable as early as 1869?—First of all, the cable was leased to Glass and Elliot, which company became the Telegraph Construction and Maintenance Company; I do not remember in what way the Anglo-Mediterranean Telegraph Company took the place of that company; very likely it did; however the essential thing is, that on the 20th of January last the Treasury sold the cable to the Anglo-Mediterranean Telegraph Company, and the India Office while of opinion that it ought to have been consulted at an earlier stage of the negotiation, acceded to the arrangement.

10073. What was it sold for?—I have got that stated here, but I want to show what the pecuniary result of the whole thing was to the India Office; the total receipts by the Indian Exchequer on account of the cable amount to 61,000 £.; the payments amounted to 176,947 £.; the total loss amounts to 115,946 £.; that is not including the interest, of course.

10074. Mr. Candlish.] Ten years' interest?—Yes, it would be about 10 years' interest.

10075. Chairman.] It would seem, as the result of the whole of the correspondence which you have stated, that the business was transacted upon the responsibility of the Treasury, and the India Office accepting the representations made by the Treasury, from time to time, formed its judgment as to what should be done with regard to the finances of India?—I think it might be represented in this way, that the India Office acceded to a proposal of the Treasury on certain conditions, or rather on the understanding that the pecuniary division should be reserved for after consideration, but that when the Treasury insisted upon payment without any principle whatsoever being defined, the India Office agreed.

10076. I mean that the expediency of the different steps was considered in the first instance and represented to the India Office?—Well, the India Office began the thing. The India Office began by proposing to the Treasury that the cable should be laid between Singapore and Rangoon at their joint expense, and then moreover when the India Office had agreed that the cable belonging to the Treasury should be employed for that particular purpose, it was the India Office which took the initiative of proposing to the Treasury, that inasmuch as that cable was heated, and could not be laid between Singapore and Rangoon, it should be laid somewhere nearer home.

10077. Upon what advice, professional or technical, did the India Office act in the first part of the operation in proposing to lay down the telegraph between Rangoon and Singapore?—I do not think that any technical advice would be required there; the question to be considered there would be whether it was advisable to have telegraphic communication between one part of the British dominions and another; and on political grounds Lord Stanley decided that it was, but that British interests were involved quite as much as Indian, and therefore he would only agree on the understanding of a joint division.

10078. But who was responsible for the consideration of the terms of the contract and its execution?—But you observe that no contract was formed for that particular purpose. As I said before, the Treasury did not reply to this letter

letter until they found that they had upon their hands a cable which they did not know what to do with; then they agreed with the India Office to join with them in the expense of laying down a cable between Rangoon and Singapore, provided that the India Office would agree to take the cable which they had on their hands; of course, Sir Charles Wood did not agree to this without having the cable examined by professional men.

10079. It was then examined, on behalf of the India Office, by professional men before it was accepted?—Yes.

10080. Sir C. Wingfield.] I do not quite recall the year in which it was determined upon to lay this cable between Malta and Alexandria?—On the 19th of December 1860, the Treasury suggested that it should be laid down between Malta and Alexandria.

10081. At that time had the Red Sea cable been laid to India?—I do not recollect.

10082. I wanted to ask whether this line was in connection with that cable?—Looking at these papers at random, I find, on the 28th of May 1859, a telegram from Mr. Newall, saying "Cable laid so far most successfully;" so that that answers your question.

10083. Chairman.] The contract for laying it was made, probably, in Lord Derby's administration in 1858, when Lord Stanley was Secretary of State?—Yes; I do not know what connection there might have been between the two schemes as far as the Treasury was concerned; I do not think that the India Office was concerned; the India Office, up to this time, had protested against having anything to do with the telegraphs running on this side of Suez.

10084. Sir C. Wingfield.] Apart from the expense, I want to know whether this scheme between Malta and Alexandria was in connection with the Red Sea cable, or altogether apart from it. And, taking the dates, I should say that a cable had been not only projected but had been laid before the proposal to lay a cable between Alexandria and Malta was adopted; is not that so?—My impression is, that when this arrangement was made for laying down the cable between Malta and Alexandria, not only had the Red Sea cable been laid, but the Red Sea cable had been proved to be worthless. I am almost positive that the Malta and Alexandria cable never worked in connection with the Red Sea cable; no one solitary message was ever sent by the Red Sea cable.

10085. Chairman.] You mean that, at the time this was laid down, the Red Sea cable had been laid down and tested, and failed?—I think so.

10086. Sir C. Wingfield.] So that, at that time, there was no prospect of continuing the communication by telegraph from Alexandria to India?—I should infer so.

10087. And, at this time, when it was decided to lay this cable between Malta and Alexandria, was there any telegraphic communication with Malta; had the Mediterranean Extension cable been laid then?—I really do not know. These are really not questions with which India is connected, and I positively do not know.

10088. But they have a bearing on the nature of this scheme; because, if it was simply to connect Malta and Alexandria, and there stop, with no further connection with India, and no further connection with London, the advantages would

be partial indeed?—I take it for granted that there must have been a connection between India and Europe, either in existence or in contemplation.

10089. Then, I gathered from the letter which you have just read, addressed by the Government of India to the Lords of the Treasury, that they threw out a suggestion that they should pay the whole of the cost of the Malta and Alexandria line, and that the Imperial Government should pay the whole of the cost of the Persian Gulf line; that one Government should pay the cost of one cable, and the other Government pay the cost of the other; and I think, as that letter put it, it was Her Majesty's Government which was to pay the cost of the Persian Gulf line?—No; it was the other way. There were two propositions: either that the Home Government should lay the whole of the cable between Malta and Alexandria, and the Indian Government the whole line in the Persian Gulf, or that the two Governments should divide the whole expense of both.

10090. At that time then it was evident that it was considered that the Home Government should bear some part of the cost of telegraphic communication with India?—Yes.

10091. But the result has been that the whole cost of the line through the Persian Gulf and of the Turkish lines has been borne by the Indian Government?—If you keep out of sight the expense of this telegraph between Malta and Alexandria, it is so; that is the only part which the British Government has contributed since the Red Sea cable failed.

10092. Mr. Fawcett.] You have represented the whole loss on these transactions resulting to the finances of India at 115,000*l*.?—Yes.

10093. But considering that the original amount expended was 170,000*l*., and that India usually borrows money at 5 per cent., and that that money was expended by India also, the more proper and correct estimate of the whole loss would be 195,000*l*., reckoning interest, would it not?—I have nothing to say against that, except that if you calculate it on that principle the expense will go on increasing for ever.

10094. But, as I understand you, the transaction here is closed. The Government buy a certain concern, and hold it for 10 years; they pay a certain sum for it, they receive a certain income from it, and at the end of 10 years they sell it, and rid themselves of the whole concern?—Just so.

10095. Therefore, to represent the true financial position of the matter, you ought properly to estimate the loss of interest on the capital expended between the first purchase and the time of sale, ought you not?—I have nothing to object to that, except that it is what no private individual ever does. When he invests money in a speculation that fails, he considers that the money is gone; he does not at the end of 10 years say, "In addition to having lost this money I have lost the interest which would have accrued on it." I do not think that we ought to apply a different principle to the operations of the Government from that which we should apply to private individuals.

10096. But do not you think that if any private individuals borrowed 100,000*l*., at 5 per cent., to invest it, and if they had to pay interest all the time on the money which they borrowed, and this money in the investment in which it was placed

Mr. W. T. Thornton.

14 July 1871.

Mr. W. T.
Thornton.

14 July
1871.

placed yielded nothing, they really ought to put the interest down as added to represent the loss which ultimately accrues?—Everything depends upon the way in which you like to make the calculation. I may show you whether I take your view or not, by stating it in my own way. Supposing that a man borrows 20,000 £, at 5 per cent., for the purpose of investing it in a speculation, which speculation fails, and the whole 20,000 £ are lost, and at the end of 10 years he calculates how much he has lost, he says, "I have borrowed 20,000 £, and have been paying interest at 5 per cent. on that amount for 10 years; together, interest and principal come to so much; that is the extent of my loss." But, then, I do not mean to say that he would not be perfectly justified in saying, that if he really has to pay 5 per cent. on the money which he has borrowed, and he has no means of repaying it, if he does not contrive to pay this money off for the next 20 years, he will have to pay 5 per cent. during those 20 years, and all this will be added to the loss of his original investment; you can put it so if you like.

10097. Still, I want simply to represent clearly and distinctly the loss which this unfortunate bargain has caused to the Indian people; they have actually paid interest on the money expended; it is an annual charge; therefore, you ought properly to include it, and say that the amount of money taken from the revenues of India owing to this unfortunate telegraphic speculation has been 195,000 £?—And inasmuch as it is impossible to prove that the money which was borrowed for the purpose of being invested in this speculation has been repaid, it is quite possible that the Indian public may still be paying interest on the money which was borrowed; therefore, whereas the loss two years ago was so much, it is now so much more; and, therefore, until the time shall have arrived when they will have paid off all their debts, you may, if you think proper, say that they never will have paid back the money which they invested in buying this particular cable.

10098. But in judging of the effects of it as a financial speculation, so far as the Indian people are concerned, it makes a difference, does it not, whether you enter into a speculation with a surplus revenue, or from borrowed money on which you are obliged to pay an interest charge?—It seems to me that the effect to the wealth of the nation is precisely the same; if they had not borrowed money, but had had 100,000 £ to spare, if this 100,000 £ had been properly invested it would have been going on yielding 5 per cent., which would have been an addition to their wealth; all that has been lost. It comes to precisely the same thing, it appears to me, whether money wasted is borrowed money or not borrowed.

10099. I judge from the general conclusions to be deduced from the tenor of the correspondence which you have read to us, and from the tenor of your remarks, that with regard to this telegraphic speculation, India was unfairly treated by the British Government; is that the conclusion which you draw?—One does not like to express such an opinion of an arrangement between two such august bodies, but if it had been individuals that were concerned, I should certainly say that there was sharp practice on the part of one of them.

10100. If, for instance, for the British Govern-

ment you substitute individual A, and for the Indian Government individual B, you say that in this financial transaction individual A has pursued uncommonly sharp practice towards individual B?—Yes; and in addition to that I say that it is impossible to suppose that any individual B would submit to such treatment.

10101. Then considering that individual B is represented by an able and accomplished politician, why did not individual B protest; India is represented by the Secretary of State, and the Secretary of State, I presume, is the Member of the British Government to protect the interests of India; why did he not protest?—That is really a question which no one but the Secretary of State can answer.

10102. Do you know whether the Secretary of State did protest?—Officially he did not; you have heard the tone of lofty indignation, in which the India Office was addressed by the Treasury, and the meek and submissive reply made by them to the Treasury.

10103. But I suppose that if it struck you that sharp practice was being pursued by the British Government towards the Indian Government, a similar impression must have been produced on the mind of the Secretary of State for India?—Always supposing that his mind was similarly constituted to my own.

10104. Are we to understand that it is customary, however much sharp practice is pursued by the British Government towards the Indian people, and however much their finances suffer in consequence of that sharp practice, that the Secretary of State should not officially protest?—My answer to that question is just this, that as to what constitutes sharp practice, opinions, of course, differ; but, I take it for granted that any conscientious Secretary of State who considered that sharp practice was being adopted would protest against it.

10105. Then I suppose what it practically comes to, is this, is it not, that if the Secretary of State does protest in a case like that supposed, he would have to protest before the Cabinet?—I simply cannot answer; I know nothing of the secrets of the Cabinet.

10106. What I want to get at is this; what security have the people of India, and what guarantee have they, that their interests are properly protected?—I should say that they have just about the same security as all men whose interests are in the keeping of other people.

10107. *Chairman.*] Have they not the guarantee prescribed by Parliament, that the members of the council, if they think that anything of that kind is being done, are expected to record their opinions on the subject?—I should say so; but it must always be recollected that the members of the council may form their own opinion as to whether sharp practice is being pursued.

10108. But if they are of opinion that injustice is being done by any act of the Secretary of State to the people of India, is it not their duty, according to the constitution, to record their views on the subject?—Certainly.

10109. *Mr. Fawcett.*] But as you say the Treasury adopted a tone of official hauteur towards the Secretary of State, would it not be likely to assume a tone of even greater official hauteur towards any protest of less important officials, namely, the Indian Council?—The protest can only be made by the Secretary of State himself.

10110. Therefore

10110. Therefore the only direct protest that can be made is from the Secretary of State, and that correspondence which you have read shows with what indifference such a protest is treated by the Treasury, does it not?—In this particular instance it does so.

10111. But should you not, from your experience, say that this particular instance was a sample of the general practice?—I do not think that my experience is sufficiently large to enable me to give an answer to so general a question.

10112. This, of course, will be a most serious question, and we shall have to account for this to the Indian people; I want that, as far as possible, you should give us an explanation which will prove satisfactory to the Indian people, that in all financial relations between the British and the Indian Governments their interests are fairly looked after?—If I am to judge from this individual instance, and giving, it must always be remembered, my own individual opinion, I should say that their interests are not properly looked after.

10113. Then assuming that they are not properly looked after, have you any suggestion by which the hand of the Secretary of State could be strengthened so as to prevent sharp practice being pursued towards the Indian people by the British Government should similar cases occur?—Again I take it for granted, that if the Secretary of State for the time had considered this to be sharp practice he would have protested; but I presume that as he did not protest, he did not consider it so; another Secretary of State might have considered it so.

10114. Having expressed an opinion in your last evidence that there is little chance of India being fairly treated when the interests of England come into conflict with those of India, have you any practical means to suggest which would give greater protection to the interests of India when they come into opposition with the interests of England?—I think myself that sufficient power is vested in the Secretary of State for India by the constitution for that purpose, if he thinks proper. I cannot say (how should I know?) whether it would be proper for him to resist the pressure of the rest of the Cabinet; but I do say that he could if he liked, that is, he might resolve not to remain in the Cabinet rather than yield. Now, to take the particular case of the Malta and Alexandria cable (I only give my own opinion), I think that in that case India was not properly treated; but I also say that if the Secretary of State had thought proper not to yield to the demand of the Treasury, the Treasury could not have forced him.

10115. Do you know whether, when the Indian Government is about to enter into a financial speculation like this that involves a considerable outlay, they take the opinion of practical engineers?—In this case it certainly was done; I have the proofs before me here. Practical electricians were employed to examine the cable and see that it was fit for its purpose, and so on.

10116. Is it the custom to take the opinion of a practical engineer as to the value of the thing; was any estimate made by practical men as to the amount of money that India ought to pay for in this particular case?—In this case, if you observe, the one thing that the India Office agreed to do was to bear an indefinite proportion of the expense of laying down a cable which was already made.

Q.59.

10117. But then do I rightly understand you that they entered into that arrangement after the outlay had been incurred?—The cable had been made at the expense of the British Government; the British Government had had this cable made for the purpose of laying it down between Falmouth and Gibraltar, and then having that cable on their hands, and not being disposed to lay it in the situation originally proposed for it, they offered to the India Office to join with them in the expense of laying a cable between Rangoon and Singapore, always supposing that the India Office would consent to take this particular cable.

10118. Who was employed by the Indian Government to protect their interests, to see that too much money was not paid for the telegraph, that it was not bought at too high a price, and that too much money was not spent in laying it down; were there practical men employed?—There were; with regard to the first point there was no question of buying the cable, it was already the property of the British Government; but with regard to the expense of laying it down practical men were employed. The Committee would not, I presume, wish to have the names of the men, but the full particulars are given in the correspondence; in fact, it was in consequence of the report of one of these professional men, to the effect that the cable could not be safely laid between Rangoon and Singapore in consequence of its being heated, that the India Office proposed that instead of being sent to Rangoon it should be laid down nearer home.

10119. Mr. Candlish.] Some expense would be incurred upon this cable in the proposal to lay it from Falmouth to Gibraltar, would there not?—That was quite an affair of the Treasury, with which we had nothing to do at all.

10120. The Indian Government was not charged with that expense?—No, we had nothing to do with laying the cable between Falmouth and Gibraltar.

10121. I mean that with reference to this particular cable which at that time was prepared to be laid down between Falmouth and Gibraltar, costs would be incurred upon that proposal in addition to the mere cost of the cable?—No doubt.

10122. Was the Indian Government charged with them?—Well, I should think not; I do not know; of course I could easily ascertain, but I never thought of looking into that point.

10123. If such expenses had been incurred and charged to the Indian Government, would you have regarded that as a just charge?—No, I should have regarded it as simply outrageous.

10124. Expense would also be incurred, would it not, on the steps that were taken to prepare it for Rangoon?—Yes.

10125. Were those expenses ultimately charged to the Indian Government?—Those would very probably be charged, that is to say, a portion of them.

10126. If this cable would have done between Malta and Alexandria, why would it not have done between Rangoon and Singapore?—For the reason that I gave, that when it had been shipped for the purpose of being carried to Rangoon, it was discovered to be in process of heating, and a Report, which I have among these papers, a Report by a professional man, represented that it could not with safety even be left in the vessel, that it must be taken out and put into tanks, and preserved in ice, and so on.

Mr. W. T. Thornton.

Mr. W. T.
Thornton.

14 July
1871.

10127. How did you get it to Malta?—It was done by the contractors who were engaged for the purpose.

10128. Would not the same appliances which took it safely to Malta and Alexandria have taken it safely to Rangoon, and laid it between Rangoon and Singapore?—I do not think it could have been trusted for a month on those ships; it had to be taken out and a certain process gone through; but quite independently of that, it would have gone into a much hotter climate, and would have been a much longer time on ship-board, if it had gone to Rangoon.

10129. Would not the course adopted in fitting it for Malta have been adequate to fit it for Rangoon?—The professional men employed certainly thought it would not, every one protested against sending it to Rangoon; it was out of the question for that season, it might have been taken out of these ships, put into tanks, and a quantity of ice put to it, and in that way kept over until another season arrived, and then it might with safety probably have been sent to Rangoon; but all that would have involved great expense.

10130. And then it would have anticipated any cable that might be laid between Rangoon and Singapore?—If it had turned out well.

10131. Was it a condition on the part of the English Government, that the Indian Government were to pay half the cost of laying the cable between Rangoon and Singapore, attached to this particular cable; did I rightly understand you to say, that the English Government would not agree to lay a cable between Rangoon and Singapore, unless the Indian Government were to take this special cable?—All I can say is, that when the India Office did propose to them to lay a cable between Singapore and Rangoon, the Treasury did not reply for many months; they simply left the inquiry unanswered until many months afterwards, when having this cable on their hands they agreed to the proposal made by Lord Stanley, provided that this cable should be employed.

10132. Does it appear in the correspondence between the Treasury and the India Office, that the proposal to lay this cable between Rangoon and Singapore was simply in order to get rid of this cable?—No; at least not farther than to this extent; they stated distinctly that they did not think it would be safe to lay the cable between Falmouth and Gibraltar until further experiments had been tried as to the safety of laying down cables in deep water.

10133. Do you know whether this cable of 1859 came up to the scientific attainments of that period?—One would suppose so from reading the reports with regard to it.

10134. You have no knowledge which could lead you to an opinion on the other side?—No.

10135. Who was the Secretary of State for India at that time?—Sir Charles Wood.

10136. And who was the Chancellor of the Exchequer?—I do not know.

10137. We hear of "The Lords of the Treasury"; who are the Lords of the Treasury, any more than the Chancellor of the Exchequer?—The First Lord of the Treasury and the Junior Lords.

10138. Do you know the procedure within the Treasury?—Not in the least.

10139. Have you any reason to believe that "the Lords of the Treasury" are simply the

Chancellor of the Exchequer?—I should have thought not; but I really know nothing about it.

10140. Probably you do know that Mr. Gladstone was Chancellor of the Exchequer, then?—I had forgotten it; but I recollect now that his name appears.

10141. How do you account for the Treasury having sold the cable in this present year, without any reference whatever to the proprietors of the cable, namely, the Indian Government equally with the English?—I cannot account for it.

10142. Has no explanation been given?—None at all.

10143. Has none been asked for?—Simply this, that the Secretary of State, in alluding to the arrangement, expressed surprise that he had not been consulted in reference to it.

10144. And you had no reply to that?—No.

10145. He did not ask why it was that the India Government's property should be sold without any reference to the Indian authorities?—No.

10146. Sir C. Wingfield.] Did they get a portion of the sale proceeds?—Yes; a small amount.

10147. Mr. Crawford.] Has anything further passed since you were last examined on the subject, with reference to the delivery charge of 9 s. 6 d. on telegraphic messages in India sent from this country?—When I was last examined, I mentioned to the Committee that I thought the Secretary of State would decide, next day, not to interfere. He has not come to any decision at all; the Government of India are continually telegraphing to know whether the Secretary of State does agree with them; but up to this moment he has not given any decision at all, the reason being that there have been strong remonstrances on the part of the Submarine Company; they remonstrating against this proceeding of the Government of India, and the Secretary of State being of opinion, I believe, that the Government of India are perfectly right, yet having been so far delayed by the remonstrances of the Submarine Company, as not yet to have sent any answer to the Government of India.

10148. What are the Committee to understand to be the position of the question at the present time?—Up to this time, the Red Sea Company have been in the habit of receiving for every message carried by them to India and delivered in the town of Bombay, although not delivered by them, 9 s. 6 d.

10149. Mr. Candlish.] What for?—I can give no reason why they should receive it; that is the point at issue. They have been in the habit of receiving this 9 s. 6 d. for every message carried by them to Bombay, and delivered at Bombay. The whole charge being 4 l. 10 s. for a message carried from England to India; if that message be delivered at Bombay they take the whole of it; whereas, if it be delivered five miles out of Bombay, the Government of India would take 9 s. 6 d., the company then receiving 4 l. - s. 6 d. With regard to a message carried by the company to Bombay, and not taken out of Bombay, the company receive 4 l. 10 s., the message being delivered at Bombay by the Government clerks and from the Government office. They have up to this time been in the habit of receiving 9 s. 6 d. in virtue of the delivery at Bombay, and the Government of India wrote a few weeks ago to let us know that they thought this an improper practice; it had recently been brought to

to their notice, and they wanted from the 1st of July to change it, and that the 9 s. 6 d. should in the future be taken for themselves.

10150. Mr. Crawford.] Is it not equally correct to say that the Telegraph Company charged 4 l. 10 s. for a message to any part of India?—That is to say, with regard to a message taken from England to any part of India, for that the company if they took charge of the message in England would charge 4 l. 10 s., accounting to the Government of India for 9 s. 6 d. of that, in regard to messages sent to any part of India, except Bombay.

10151. And upon that you place the construction that the Government get nothing for the delivery of a message in Bombay, in respect of which they have very little labour or expense?—Yes.

10152. Whereas, now you are going to charge the same sum for the delivery of a message next door in Bombay as you would if you sent it to Calcutta or Madras?—That is the prospective arrangement.

10153. And do I rightly understand that the Government of India are still pressing that on the Government here?—Yes.

10154. But the Government here have not yet made up their minds on the subject?—They have not yet agreed to do it.

10155. Do you remember a deputation connected with commerce waiting on Sir Stafford Northcote some years ago, and pressing on him the expediency of establishing telegraphic communication with India by way of the Red Sea?—I have some recollection of it.

10156. Was not the answer that Sir Stafford Northcote gave to those gentlemen to the effect that such an enterprise as that should be carried out by private capital and private intelligence, and that the Government could not undertake it?—I do not recollect his giving that answer, but I feel sure that that would be the answer that he would give.

10157. Then private individuals having undertaken that task, ought they not to expect any reasonable facility from the Government of India in carrying out their business?—I think that what they are entitled to in carrying messages to India is, the whole of what is paid by the senders of those messages for that conveyance.

10158. But having taken on themselves, in answer to Sir Stafford Northcote, a very risky business, ought they not to receive a liberal consideration and treatment at the hands of the Government of India?—If "liberal consideration" implies any pecuniary contribution from the revenues of the people of India, I should say certainly not.

10159. Do you not think that they ought to have the same accommodation given to them with respect to their messages in India as Indian messages have when they are received in this country at the hands of the Post Office authorities here?—I can give a very good reason why they should not. In the first place, in a country like this, where there is an immense deal of traffic; a very much lower rate will pay the expenses. It would be quite an impossibility for the Government of India to charge so low a rate for the conveyance of messages across that great country, where, moreover, the telegraph has been established at so great an expense, and is maintained at so great an expense.

10160. I am not talking of actual comparison 0.59.

of rates, but as to the principle on which messages of the public should be received and accommodated in India. What I mean is this: in India you tell us that you intend to charge 9 s. 6 d. as a recompense to the Government for the labour of carrying every message received at Bombay to any part of India, the next door house even in Bombay included, the charge for a regular local message of 20 words carried from Bombay to any part of India being 4 s. Now, in this country the charge for a local message is 1 s., and it has already been stated, I believe, in evidence (if not, I believe I may state it to be a fact) that the cost of bringing an Indian message received at Falmouth to London is not in the proportion of 9 s. 6 d. to 4 s., but in the proportion of 9 d. to 12 d. Now, can you justify the excessive difference in the relative treatment of the same line at either end; in the one case you carry the message here for 75 per cent. of the regular charge, and in India you carry it at a cost of something more than 200 per cent. of the regular charge?—A very great number of points are involved in your question. I think I can justify the Indian Government in regard to every one of them. Let us take, first, the one upon which you lay the most stress, namely, that whereas the English Government charges less for through messages than for local messages, the Indian Government charges twice as much apparently for through messages as for local ones. Now, with regard to that, I have first of all to endeavour to set the Committee right with regard to the matter of fact. It is quite true that for a message of 20 words taken from England to India by the Red Sea Company to Bombay, and carried from Bombay to Madras, or Chittagong, or any other part of India, the Government of India will charge 9 s. 6 d. for its delivery in India; whereas if the message had not come from outside of India, if it had originated at Bombay, and been carried to any other place in India, then for that message the charge would only have been 4 s. Apparently, there is a difference of 5 s. 6 d. in favour of the local message; but then it must be understood in regard to the through messages, that they are carried in a different way, and with many attendant advantages; this charge of 4 s. on local messages is made on the understanding that they shall not be carried at night, that they shall not be carried on Sundays, and that they shall not be carried on holidays; whereas through messages are carried at all times, night and day, on all days, and in addition to that, they are all repeated, no local message being repeated. I have not put my case quite strongly enough yet; if a local message should be carried on these exceptional days, and with these exceptional advantages, then it is carried at different rates, which I have got here if the Committee will allow me to refer to them. We have said with regard to local messages, that the ordinary rate is two rupees, or 4 s. for 20 words; now if a local message were sent on Sundays, or between 10 p.m. and 6 a.m. on week days, instead of being charged only 4 s., it would be charged 8 s.; if it were a cipher, or code message, it would pay 8 s., or even 16 s. if sent on Sundays, or at night; now these are the ordinary local charges for local messages; these are the charges which would be made for a local message if it were sent in the same way as a through message; therefore, I think the Committee will see that local messages really and truly for equal services,

Mr. W. T. Thornton.

14 July
1871.

Mr. W. T.
Thornton.

14 July
1871.

vices, not only do not pay less, but pay more than through messages. Now in further justification of the amount, namely, 9s. 6d., which does no doubt seem a very large amount (and I will not say that it is not too much), there is this further to be remembered; that when the Red Sea Company was established special wires were put up at a very great expense for the conveyance of those messages; they are not sent by the ordinary wires. Now, again, to see whether the amount be too large, the Committee will recollect that when I was last examined, I showed that notwithstanding the high rates for telegraphic messages in India, the whole telegraphic establishment was carried on at a loss to the Indian Government of 80,000 l. a year without counting interest; if that is the case it shows, I think, that the local rates are not too high, not high enough in point of fact, so that even if the rates for through messages were more in proportion, it would not be a proof that they were too high.

10161. May it not be the fact that that loss is sustained by your rates being too high generally?—The answer to that would be that they have been very greatly reduced lately in the expectation that a diminution of rates would cause an increase of traffic, and in that expectation I am sorry to say that the Indian Government has been greatly disappointed.

10162. How long have they been so reduced?—Eighteen months or two years, I think.

10163. Is it not probable that the charge of a double rate upon ciphered messages may have something to do with it?—I do not think so.

10164. On what principle do they charge a double rate for ciphered messages?—I believe it is universal.

10165. That all telegraph companies charge double for a cipher message?—That they charge more at any rate; I believe they charge double.

10166. Is not that charge owing to a feeling on the part of the Government of India that treasonable messages may be sent under the guise of cipher?—I do not imagine so; I do not think that that motive can at all weigh with the Red Sea Company here; and, moreover, though I do not like to speak very positively about it, I am almost certain that the Vienna Convention lays that down as the law to be obeyed by all parties to the Vienna Convention.

10167. But the Indian Government is not under the dominion of the Vienna Convention?—Excuse me, they are.

10168. As regards their internal business?—Yes.

10169. Are you bound by their rules?—Yes, the whole of India was represented at the last Vienna Convention.

10170. Do you mean to say that the Indian Government cannot alter their internal rules as regards the conveyance of messages from Bombay to Calcutta, if the alteration is not in accordance with the prescriptions of the Vienna Convention?—I do say so, that they could not alter the rates in contravention of the rules of the Vienna Convention.

10171. Is it not a fact that the Indian Government have declined to allow the British Indian Company to have an office of its own in Bombay?—I answered that question at my last examination; I am quite ready to repeat what I said then.

10172. It is so, is it not?—I do not like to say that the Indian Government declined to allow

that; what they did was to offer something to the company which the company preferred.

10173. Did the company want an office of their own in Bombay?—They did want an office of their own in Bombay.

10174. And that the messages should be received in their own office?—Of that they said nothing whatsoever.

10175. Is it the fact that the Government, having the dominion over their own office, are prescribing rules and forms to be filled up in that office in which messages are to be sent over a line with which they have nothing to do?—I have not heard that that is a fact; I should think that they were going beyond their province if they were to prescribe certain forms with respect to the conveyance of messages which were to be sent over lines that were in no respect their own.

10176. It has reached my ears that the Government are laying down a form to be filled up in their office at Bombay for messages intended to be sent to this country; what is the reason of that?—I suppose that they would not do it without a reason; I do not myself see what reason they can have for it.

10177. Mr. Grant Duff.] The state of the case is this, is it not, that with regard to all international charges we are bound by the Vienna Convention, but not with reference to our internal tariff?—I believe that that is the right statement of the case.

10178. Sir C. Wingfield.] In fact the terms of the Vienna Convention leave the Government free in regard to internal traffic?—The correction which Mr. Grant Duff has just made of my previous answer applies to local messages not to through rates; they might alter the local rates. I was really thinking of the conveyance of through messages through India.

10179. You dwelt a good deal on the great advantages that the Submarine Company enjoyed in having its messages carried by a special wire, and also in those wires being worked all the 24 hours; whereas local messages have to go on the ordinary wires, where they may be delayed, and they are charged double between certain hours at night; but is it not the case that by Articles 1 and 2 of the Vienna Convention you are bound to send international messages or submarine messages by a special wire, and to make the same charge night and day?—I doubt it very much, without seeing it in black and white; but, at any rate, even supposing that it was so, the Vienna Convention does not require you to make new wires, which was what we did, and better wires than we had before.

10180. If it binds you to send the messages by a special wire confined to international messages, it binds you to provide that wire, whether new or already existing?—I really have not the Convention here, and without having it I do not like to admit that we are bound to that.

10181. I speak from my recent reference to the book?—But is it your meaning that all through messages are to be carried by a wire which is appropriated to them, and to them alone.

10182. That international messages shall be sent by a special wire, and that they shall be sent at all hours; that is my reading of it yesterday. My argument upon that is this, that inasmuch as you cannot help giving us those advantages by the terms of the Vienna Convention, the British Indian

Indian Company owes the Government of India no special thanks for those advantages. What have you to say to that?—I think I must remind you that the Vienna Convention in assigning certain duties to certain administrations, also does distinctly say what rates they may charge for them, and the Vienna Convention does entitle us to charge 7 s. 6 d., and did entitle us to add the 2 s., which makes the 9 s. 6 d.

10183. But your argument was that if the British Indian Company considered that the special advantages which it got in reference to having messages sent at all times, and having a special wire, the rate of 9 s. 6 d. would not be more than the local rate; and the answer to that is, that inasmuch as it is not optional with the Indian Government to provide a special wire, and send those messages at all hours, but they were bound to do it by the Vienna Convention, that does not furnish any plea for charging a higher rate?—The simple question is whether the 9 s. 6 d. is too much.

10184. That is the general subject for discussion; but I am interrogating you on the reason which you particularly assigned for charging that 9 s. 6 d. Have I not shown that that reason does not apply?—But perhaps I may be allowed to alter the words which you have suggested for me; I did not assign that as the reason why the 9 s. 6 d. was charged; I assigned that as the reason why the 9 s. 6 d. was not too high.

10185. That is the same thing; and I say that those reasons fail. However, we have not the Vienna Convention here, and therefore there is no good in saying any more on that point now. Are you aware that the French Government have recently allowed the British Indian extension cable to land at Porte St. Jaques, which is the port of Saigon, and that under the agreement they make the same charge for the messages to Saigon as by local rates, and no more; and that they also allow them to have an office of their own, and delivery clerks of their own, or to use the Government offices?—I did not know that that was the fact; but if it should prove to be the fact, both there and in another case which was mentioned to me the other day by Mr. Pender, I should say that such exceptions only prove the rule. The rule is, that Governments do have a terminal rate; and when in reply to such an assertion as that, I am told that it is not done at Saigon, and that it is not done in Egypt, I say that such exceptions prove the rule. I should like to read a memorandum which has been kindly drawn up for me by Major Champain, who has looked into the matter. We wanted to know whether we were justified in saying that a terminal rate is charged by the European Governments, and he has looked into the matter, and this is the way in which he gives it to me: "In Article 14 of the Brussels Convention of 1858, the high contracting parties adopt as the basis for international tariff the then recognised local rate of 1 s. 3 d. per 50 miles, 2 s. 6 d. per 100, and so on for messages of 20 words. The inconvenience of this system, which necessitated a different rate from and to every different station in Europe, and involved terrible intricacy of account, led at the Paris Conference of 1865 to the adoption by universal agreement of an average through and terminal rate for each State, and this arrangement was, without a solitary objection, continued at the Vienna Conference of 1868. It is an invariable rule to charge the terminal

rate for a message directly it crosses a frontier either marine or land. The Vienna Convention defines as follows: 'La taxe terminale est celle qui revient à chaque. Etat pour les correspondances en provenance ou à destination de ses bureaux.' On this principle the British Post Office receives a terminal rate on all the cables between England and the Continent, of which there are 22 to France, 8 to Holland, 9 to Belgium, 1 Jersey to France, and others to Denmark, &c. All, without exception, pay the same rate for all England, the same for all France, all Holland, all Belgium, &c.; so that, for example, a message from Dover to Calais pays precisely the same tax to England and France (irrespective of cable charge) as if it had passed between the Shetland Isles and Marseilles." And here there is one more example, to which I particularly request the attention of the Committee: "Another example is this: a message from India to Fao (at the mouth of the Euphrates) pays our cable charge and in addition 9 francs to Turkey, although delivered possibly a few yards from an office door and never passing over a Turkish wire at all."

10186. You make the rule yourselves then, do you not?—Excuse me, that is what we pay to the Turkish Government.

10187. You say that in all countries they take a terminal charge, but in England certainly that terminal rate covers the transit rate, because no messages are received and delivered on the sea coast, either on the Anglo-American or on the British India line; there is no local traffic whatever, and the messages are sent all over England, therefore it is really a transit rate?—There is no parallelism between England and India; still what you have just said applies equally to India; we charge the same for through rate as we do for terminal rate; although for this message delivered at Bombay next door, we charge 9 s. 6 d.; we should charge no more than 9 s. 6 d. for it if we carried it to Chittagong.

10188. But in one case you carry a message 50 miles, or 1,000 miles, and in the other case you charge for carrying it next door?—It would be unpardonable for anyone but a Government to charge money for doing nothing; in a Government it is pardonable. The complaint against the Indian Government is that it charges the people of Bombay 9 s. 6 d. for merely delivering messages to the house next door; or rather not that it does so, but that it contemplates doing so hereafter. Observe, that that being the complaint against the Indian Government, what possible excuse can be found for the Submarine Company which up to this time has always charged that 9 s. 6 d. for messages which it did not deliver, but which have been delivered by the Government clerks. If the charge is to be made at all, should it be received by the Government who do what little service is done, or by the company who do not do even that little service?

10189. When you say that you must be aware that the British Indian Company would be only too happy to be allowed to deliver by their own clerks, but the Government will not allow them to do so?—But the question we are now talking of is whether it is right that 9 s. 6 d. should be charged for delivering messages brought to Bombay in Bombay; whether that charge be made by the company or by the Government cannot make any difference with regard to the principle;

Mr. W. T.
Thornton.

14 July

Mr. W. T.
Thornton.

14 July
1871.

principle; if it be a complaint against the British Government that they should charge so much for doing so little, the complaint is still greater against the Submarine Company for charging so much for doing nothing at all.

10190. You are aware that in the interview you had with Mr. Pender, the British Indian Company said, "Very well we will not take the 9s. 6d., do not you take the 9s. 6d., let the public have the benefit of it?"—Really the question divides itself into three branches, first of all the propriety of levying a terminal rate at all; secondly, that being admitted, the next branch of the question is who shall receive it, the company or we; and the third question is whether the amount be too large or too small. It really would be advisable to keep them distinct.

10191. I think you admitted that the British Indian Line was a benefit to India, that it would be a calamity if this line were stopped, and you had not an alternative line?—A very great calamity indeed.

10192. You are quite right to grant no favour to the British Indian Company, but why not give it a fair field; allow it to have its office and delivery clerks at Bombay, and allow it to solicit custom, and enjoy perfect freedom to consult the benefit and interests of the public fairly, without hindrance or restraint from the Government?—Well, it is not for me to suggest what questions I should be asked by the honourable Member; I am quite ready to answer that question, but I wish it had been postponed; I wished to have disposed of the terminal rate first, but if I am asked why the company are not to be allowed not only to have offices, but to receive and deliver the messages and charge for them, the sort of answer I should give would be this: the reason why the Government would not allow them such commercial freedom is the same reason for which all Governments shackle commerce, for the purpose of getting revenue.

10193. Mr. Crawford contrasted the different treatment by the Government at one end of the cable and that of the other; that whereas the English Government charges less than the local rate, the Indian Government charges a great deal more?—But really there is an open question now between the Government of India and this company; the company are levying this charge now, the Government wish to levy it, and that question is unsettled, and I wished to give reasons why the Government might claim it. There is another thing that I should like to mention. Up to this time the company have been receiving this terminal charge, which amounts to about 8,000 £, which has been paid to them for doing absolutely nothing. What little is done is done not by them, but by the Government officers. There is no doubt about this, that the 8,000 £. are paid into the company, that the terminal rate amounting to 8,000 £. is received by the company, and the company do nothing for it. What I want now to point out is, that this 8,000 £. comes out of the pockets of the people of India, and is really equivalent to a subsidy to this company. Now, quite apart from the general inexpediency of subsidising any company, there are special reasons why this company should not be subsidised. When this company was in process of formation, it was very much afraid of the rivalry of the Indo-European Company, which goes through Russia and Persia; the latter was then rather more than in process of formation, because it had been formed

and was about to open its communications. Now, in the letters addressed to the India Office by the Red Sea Company when it was in process of formation, there were various things that they demanded, but one thing in particular, that we should never henceforth give any pecuniary or financial assistance to any line which could come into competition with theirs, and the Secretary of State gave the promise that he never would give such pecuniary assistance. Nevertheless, inadvertently, the Indian Government has up to this moment been giving a subsidy to this very company which remonstrated against subsidies being given to any, and the Government of India finding out this wish to correct it for the future.

10194. You call it a subsidy, not to take the same amount for messages delivered in Bombay that it does for messages delivered in Calcutta?—No.

10195. Because they did take 9s. 6d., and are going to take 9s. 6d., for messages delivered in Calcutta, and they have never yet taken it in Bombay?—It is not as if a different charge were made to the public at Bombay from what is made at Calcutta; it is 4 £. 10s. in both cases; the only question is, who is to get the odd 9s. 6d. I say that if the Government in every other case gets it, but in Bombay lets the company have it, it is subsidising the company.

10196. How do you meet what the company say, "We will not charge it; do not you charge it"?—I think that in saying that, the company are talking very much like the dog in the manger, if he could talk. "We were quite content to charge it as long as we could have it; but we object to your charging it when we cannot have it." The people of Bombay have never complained; they know perfectly well that if an average rate be established all over India, the average rate must be in some places too high.

10197. The people of Bombay would prefer to get their messages for 4 £. to getting them for 4 £. 10s., would they not?—I think it is very possible that the people of Bombay may be sufficiently enlightened to be willing to pay 4 £. 10s. in order that they may pay only that when they go to the other end of India, just as we are willing to pay a penny on our letters in order that people in the Isle of Man and at John-o'-Groat's House may pay only a penny.

10198. Mr. *Fauvelt*.] Suppose that the question came under the consideration of the India Office, whether a guarantee should be given, I believe that no guarantees are given at the present moment; but if in past years the question arose, whether a guarantee should be given of 5 per cent. to any proposed railway, what course was adopted with a view of ascertaining the advisability of the guarantee or not?—I think it is for the Secretary of State to judge for himself, where he would seek for advice, where he would seek for information, and the means of forming a judgment. He would apply for opinions to any persons whom he thought capable of giving them.

10199. I understand from Mr. Secombe that it specially formed a part of your official duties to advise the Secretary of State as to the advisability or unadvisability of giving a guarantee?—I should give a very different definition of my own duties myself. My business is rather to carry out the instructions of the Secretary of State, or to put them into writing. At the same time, no doubt, every Secretary is very frequently invited to give an opinion, and very often is

is permitted to volunteer one. In my own case, I often am invited, and often do volunteer; but that really is a matter of grace on the part of the Secretary of State; he listens to me, and allows me to speak or not, as he thinks proper.

10200. Do you know whether, for instance, careful estimates are made before the guarantees are promised as to the probability of the railway realising 5 per cent., so as to cover the guarantees?—Almost all the guaranteed companies were created before I had the railway business. I can undertake to say that no guarantee ever would be given again without a most careful estimate as to the railway paying.

10201. In past times, have not railways been guaranteed since you were connected with the railway department?—One or two.

10202. If that case, was an estimate made of the probability of the railway paying?—An estimate, considered to be careful, was made, but nothing but the result can prove that it was careful.

10203. What steps were taken; were engineers employed?—Yes, in all cases the land is carefully surveyed, reports are given as to the existing traffic, estimates made of the probabilities of the increase of the traffic, and so on.

10204. Do you know whether in that particular case the estimates turned out to be at all correct?—The one which I am thinking of now is the estimate for the Carnatic Company. I do not think that of it the first sod has been laid yet, and I do not think that besides it and the Oudh and Rohilcund any railway has been guaranteed in my time.

10205. But suppose the estimate did not show that the guarantee would be covered, would it then be part of your duty to point that out to the Secretary of State, and advise him that no guarantee should be given?—It might not be my duty, but certainly it is an office that I should presume to take upon myself. I should venture to state to the Secretary of State my objections, but it would be entirely for him to judge whether what I said was worth listening to.

10206. Do you know whether in every case in which 5 per cent. was guaranteed, the estimate showed that the 5 per cent. would be realised?—No; because in many cases the objects of the railway were considered to be at least as much, if not more, political and military than commercial.

10207. Sir S. Northcote.] I think that the questions of the honourable Member for Brighton, if I understand them rightly, point to the general system upon which the Secretary of State proceeds in acquiring information, in order to judge whether he should, or should not, give a Government guarantee for a particular work. Would you just mention to the Committee what you consider to be the relative functions of yourself as Secretary of one of the departments of the India Office, the members of Council, the Committee, especially, of Council, which looks into railway matters, and the Secretary of State?—Speaking with regard to the papers upon which the whole affair was based, whether it was an application from some company which wished to create the railway, or whether it was a letter from the Government of India, or whatsoever the document might be, in all probability it would come in the first instance to myself; I do not mean by that, that it would not come before the Secretary of State, but the Secretary of State

0.59.

refers it to me, and then my business upon that is to read it, and place upon it a sort of report, or *précis*, or minute, or whatever else it is called, which first of all states the contents, and the object; and in addition to that, I always consider myself at liberty to give my opinion as to the propriety or policy of acceding to the application; then, I having done this, this report of mine goes to the Under Secretary of State, who sends it to the Secretary of State, either one or the other making comments upon it in those stages as he pleases; and then the Secretary of State refers it to the Committee, who again consider it, and either adopt it, or modify it, or reject it, or substitute something for it; and then after the report, or whatever it is called, has passed through that ordeal, it goes again back to the Secretary of State, who again sends it to the Council, who again sit in judgment on it, and either modify it, or accept it, or reject it with the Secretary of State's concurrence; he, as I understand and take for granted, being the final judge as to the final course to be adopted; every one as it seems to me is responsible to the Secretary of State for the opinions which he offers to the Secretary of State, the Secretary of State being himself responsible for the action which he takes on those opinions.

10208. When you say that the Secretary of State is the person finally responsible, do you mean the Secretary of State individually, or the Secretary of State in Council?—Well, I answer the Right honourable Member with great diffidence; but I should have thought that in all cases, except those of finance, he was individually responsible. This particular one is a question of finance, however, and he could not in such a case decide without the consent of the majority of the Council.

10209. That is to say, it would not be competent for the Secretary of State to give the guarantee of the Government of India to any public work, railway, or otherwise, unless he obtained the assent of the majority of the Council?—That is so.

10210. Then before the matter is finally discussed and decided in Council, the Secretary of State has had the advantage, at all events, of the official experience of the Secretary of the Public Works Department and of the Members of Council who form the Committee which sits upon public works?—Just so.

10211. Now are you aware whether it frequently happens that in addition to consulting those authorities, the Secretary of State either himself consults, or desires those with whom he is in communication to consult, persons outside the office, who are competent as engineers, or from other reasons, to form an opinion upon the question at issue?—I almost doubt whether in any case the Secretary of State has taken such a step as that. I think myself that though he would require an engineering opinion, he would think very likely that the engineering opinions which he had obtained from India would be of more value than any which he might obtain from engineers in England, owing to their not having had Indian experience and local knowledge; but, of course, it is competent to the Secretary of State to do that if he thinks proper.

10212. But is it not within your knowledge, as a matter of fact, that the Secretary of State has from time to time consulted engineers with reference to such works as the Kurrachee Har-

Mr. W. T. Thornton.

14 July 1871.

Mr. W. T.
Thornton.

14 July
1871.

bour or the bridge over the Hooghly, or various other works of that kind?—Yes; I thought you were speaking only of guaranteeing railways.

10213. The same principle would apply to the guaranteeing of railways, as of any other works, would it not?—Much the same process is adopted; as I said, in answer to the honourable Member for Brighton, before any railway is undertaken a very careful survey is made of it, which implies that engineers are specially employed to investigate the matter. Of course their report comes to the Secretary of State, which is another form of his consulting them. But in regard to the Kurrachee Harbour Works, the Secretary of State took the initiative there, and sent out an engineer to examine.

10214. As I understand, the honourable Member for Brighton wants to ascertain whether the Secretary of State, who is probably a person versed in political life, but is probably not conversant with matters of engineering, takes the responsibility upon himself personally, or whether before doing so he takes steps to consult those competent to form an opinion and give information, and if he takes steps to obtain the opinion of those competent to form an opinion, what those steps are?—Invariably one way or another he would either himself ask the opinion of competent men, or when the project was placed before him, it would be accompanied by the opinions of practical men who had been previously consulted.

10215. I rather think that this question arose, in the first instance, out of a question with reference to the Mutlah Railway; that the question was asked by the honourable Member for Brighton, who was responsible for recommending, first, the guaranteeing of that line, and, secondly, the taking of that line upon the Government; can you say who would have been responsible; of course, the ultimate responsibility rests upon the Secretary of State, but I mean what advice would the Secretary of State have received before he decided on those two steps?—I cannot answer as to the facts in respect to the first part of the question; I know what he might have done, and what, in all probability, he did. For example, with reference to the construction of this railway from Calcutta to Port Canning, the Mutlah Railway, my idea is that in this particular instance the Secretary of State got the first idea from the promoters of the company who wanted to create this railway; I do not think that the original idea came from the Government of India; but, of course, the Secretary of State would not have guaranteed such a railway without taking some steps to ascertain whether the Government of India concurred with him in the propriety of making it. There is no doubt that the line has turned out a failure, but I do not think that there is any difficulty in seeing why.

10216. Then, according to your experience, it probably was the case that the original guaranteeing of this line was the result of communications between the Government of India and the Secretary of State?—I can scarcely doubt that; I do not recollect it, but I cannot conceive that the Secretary of State could have guaranteed the line without ascertaining whether the Government of India concurred with him in the propriety of doing so.

10217. *Chairman.*] I think, as a matter of history, that line was particularly pressed upon the Home Government by Lord Canning, when he

was Governor General?—That was not my impression; I rather thought that it was pressed upon Lord Stanley by people in India.

10218. *Sir S. Northcote.*] You are not able from memory, it seems, precisely to state what the circumstances of the guaranteeing of that line were. Can you say how those circumstances can be got at in case the Committee wish to investigate them?—Nothing would be more easy; we have nothing to do but to refer to the correspondence.

10219. And you would be the person in the India Office to give the answer?—Now, I should; but at the time that that company was guaranteed, though I was Public Works Secretary, I had not charge of the railway business; that was transferred to me afterwards.

10220. And similarly, with regard to the subsequent transactions, when the line was taken out of the hands of the company by the Government, you would be able on referring to the correspondence to give the answer?—That part of the question I can answer at once.

10221. Perhaps you would mention generally how that came about?—It is just this, that the railway did not pay its working expenses; every year there was a deficit, of which the Government got tired; they got tired of adding this deficit to a debt of which they saw no prospect of recovery, and so they gave the company to understand that if things were to go on in that way the company would have to pay it out of their guaranteed interest, which means that they could not have given 5 per cent. to their shareholders; the guaranteed interest being 5 per cent. on the cost of the line, of course it would not pay 5 per cent. to the shareholders, if they had to deduct out of that any loss for their working expenses.

10222. *Mr. Crawford.*] Then the company could have enforced the surrender clause, and called upon the Government to take over the concern?—Yes.

10223. *Mr. Fawcett.*] Am I to understand from your answers to Sir Stafford Northcote, that when we are investigating the question of railway guarantees next Session, you would be the proper person under the authority of the Secretary of State, to produce from the India Office all the papers with the names of those people who wrote them, upon which the Secretary of State formed his opinion as to the advisability of giving any particular guarantee, assuming that the Committee desire the production of such papers?—I should be the proper officer of the department to give any information relating to railways, and to produce those papers under the authority of the Secretary of State. I mean so far as the Secretary of State has formed his opinion upon documentary evidence.

10224. *Sir Stafford Northcote.*] It is possible that he might have formed his opinion to some extent on interviews, or non-official correspondence which does not remain in the office?—Yes.

10225. *Mr. Beckett Denison.*] Are you cognisant of the transactions that took place between the Orissa and Behar Irrigation Company and the Government of India, at the time of the taking over of the works of that company?—I am.

10226. I wish to direct your attention to some answers that Mr. Geddes gave in answer to the honourable Member for Brighton: At Question

tion 9525, Mr. Geddes says, "I would point out, for example, that in the talking over of the Orissa Irrigation Company, it was well known that the company had been paying dividends out of capital, and it was notorious that the shares were at a discount." The next question is, "Then did the Government take over a company whose shares were at a heavy discount, and take over the shares at par?—A. I believe so. Q. Did they give anything besides that?—A. I think they gave 50,000 £. as a bonus, and they gave also 14,000 £. to keep up a scheme called the Behar scheme, for which the company had some kind of promise, but for which they were unable to raise capital. Q. Then is it your opinion that a company whose shares were at a very heavy discount, and which had been notoriously paying dividends out of capital, was bought by the Government at par, and received 50,000 £. in addition?—A. I believe those were the facts. Q. And you state that opinion after perusing the documents?—A. Yes." Would you kindly tell the Committee, if you can, what were the considerations that led the Government of India to take over those irrigation works on the terms that they did?—The grounds are both general and special. Generally the Government of India think it very unadvisable, that any private companies shall create or have anything to do with irrigation works. There is no occasion to state what the reasons are for that opinion; I presume they are tolerably patent. But with regard to this particular company it is the only unguaranteed company, or almost the only unguaranteed company that ever really had any status at all. I do not mean to say that there were not one or two other abortive undertakings that lasted for a time, but this company without a guarantee, did succeed in raising a capital of, I think, a million, for the purpose of creating irrigation works in Orissa. But having expended the whole of this million it came to a stand-still; it could not raise any more, and it applied to the Government for assistance. The Government gave it a certain amount of assistance, principally because it was necessary to give employment to the starving population.

10227. Pecuniary assistance, do you mean?—The Government advanced money, but, as I say, principally with the view of affording employment to the starving population of the district. But the Government did not think that that would be a plan which it would be at all advisable to continue indefinitely, and there really was no prospect, at least the Government thought there was none, of the company being able to raise any more money without a guarantee, or without some sort of assistance from the Government, which the Government simply had no idea of giving. Well, it was very important that these works should be continued one way or another, and inasmuch as the company could not continue them without the assistance of Government, the only alternative was for Government to get them out of the hands of the company, and it did so by offering them these terms, which, in one sense, certainly were very extravagant. There is no doubt that the shares of the company were at a heavy discount, and that we paid, for the shares at par; and, in addition to that, gave them 50,000 £., not exactly as a bonus, that is not exactly the proper word; this 50,000 £. was given in order to compensate those officers of the company who might lose their employment in consequence
0.59.

of the transfer. With regard to the 14,000 £., certainly something was given in consideration of the Behar scheme, but I forget the exact amount; but in all other respects the facts are substantially as they are stated in the evidence of Mr. Geddes. I say that this appears in one sense to be an extravagant bargain on the part of the Government, but the Government, nevertheless, thought that if these works were continued they would be remunerative, not perhaps so largely remunerative as the company had been in the habit of thinking and representing to the public in general, but they had reason to believe that they would be fairly remunerative; and I must just add to that, that, according to our most recent Reports, and we have had lately a very elaborate Report drawn up with extreme care upon these Orissa works by one of the most eminent engineers in India (*vide* Appendix), there is every reason to believe that the works will pay very fairly indeed, some 10 or 12 per cent. I am not sure whether it is not more, but there is every prospect now of their paying fairly. It will take some time, because they were works which really involved an immense deal of unproductive expenditure before the productive expenditure could commence. It was necessary that an immense amount of money should be spent in bridling the rivers, before any steps could be taken for turning the water to account.

10228. Had not the Government come to the rescue, what would have been the natural result; the works would have been indefinitely postponed, I suppose, the company not being able to find the money, and the Government could not have compelled the Irrigation Company to withdraw from the country, nor yet to complete their works?—I think that unless the company had gone to Parliament, as they very probably would, and endeavoured to get a special Committee to examine into the whole thing, and recommend that Government, in spite of itself, should guarantee them, the company must have come down to any terms that the Government had thought proper to offer. In the meantime the works would have deteriorated; the Company would have fought a hard battle for it, no doubt; but still, if they had not got this support, which most companies of the kind think that they may get from Parliament, then the result would have been that they must have come to the Government and accepted any terms that the Government thought proper to offer.

10229. And were the terms as finally arranged by the Government contested by the Irrigation Company as insufficient?—They were, strange to say; the strangeness can be explained, if it is worth while to explain it. One thing was this; the Government of India wrote a despatch to the Home Government, that is to say, to the Secretary of State, recommending the purchase of the works, and giving their reasons in great detail, but particularly saying that they thought that the works might pay; they were not very sure about it, but it was probable that they would pay more or less one of these days; but still the great reason for taking them over from the company was not that they expected to make much by them, but the extreme impolicy of leaving them in the hands of the company. Well, if the details of this despatch had been known to the shareholders of the company, I have no doubt that the company would have been uncom-
monly

Mr. W. T.
Thornton.

Mr. W. T.
Thornton.

14 July
1871.

monly glad to get paid at par for shares at a discount; but as they really did not know them, they began to imagine that the Government thought that the undertaking was a very good one indeed, and were trying to get it on cheap terms; the company being in the dark, and taking it for granted that the Government must be endeavouring to drive a hard bargain, said, "If they are offering so much, it must be because they think that the works are worth more."

10230. Mr. *Eastwick*.] The great difficulty had been, had it not, to get the ryots to take the water?—There had been that difficulty.

10231. And there had been a great outlay, and the prospects of getting repaid were considerable at the time that the Government insisted upon these works being given over; and that that is the case is proved by the report which you have just mentioned, which shows that they were likely to pay 10 or 12 per cent.—I think that all that you state is quite true, as is proved by the result. The works were in a condition in which the judicious expenditure of a further sum would have made them remunerative; but then the difficulty was to persuade the shareholders of that. The public could not be convinced of that; all they did know was, that they had already subscribed a million, and had not got a penny of dividend except from capital.

10232. You would say after all, would you not, that the company had some reason for rather demurring to the arrangement?—I do not think so at all. I think that I have given the simple reason; the public not knowing the views of the Government, finding that they made a liberal offer, and taking it for granted that they wanted to drive a hard bargain said, "If they offer so much for the works, it is because they think them worth more."

10233. Mr. *Beckett Denison*.] Was not there a reason of policy in the Government offering these liberal, or even as you say extravagant terms, namely, that they did not wish it to go forth to the country, that Government had done anything in the way of strangling private enterprise in India?—I have no doubt that there would have been a very great outcry about it; and indeed there is some justification for the company. Since these men who had been induced to raise money without a guarantee had entered into a bad speculation, I think that if ever any men did under similar circumstances deserve consideration from the Government, those men did.

10234. You say that you have every reason to believe, from the latest report, that these Orissa irrigation works will prove productive; from evidence given to the Committee, there is some fear that the irrigation accounts are made to include the increase of the land revenue, that that is comprised in the irrigation works accounts, as well as the water cess proper. Can you give the Committee assurance that any returns which are brought before us of the remunerative character of these irrigation works shall be made to show the details both as to the water rate and as to the increased land revenue?—It is worth while explaining to the Committee that the practice in reference to the returns from irrigation works is different in different parts of India. In Madras it is as you say, but not in all parts of Madras. In the old works of the Cauvery Delta, and in most of the irrigation works of Madras, there is no special charge made for the supply of

water, but the Government having created an irrigation work, charge a higher land tax for irrigated land than for unirrigated land, and therefore in the greater part of the Madras Presidency it is almost impossible to ascertain how much of the increased revenue which follows irrigation works is due to those irrigation works. It is a constant subject of dispute between the engineers and the revenue officers; but in the north of India, with regard to all those irrigation works, the revenue for which the works get credit, is simply direct revenue obtained for water, you charge so much for the supply of water. There are also certain miscellaneous charges, tolls, and things of that kind, but the revenue for which the department takes credit, and will take credit in this case, will be what it gets for the supply of water. Quite irrespective of that, there is the indirect revenue, the increase of land revenue consequent on irrigation.

10235. Mr. *Eastwick*.] In these reports just come home, does it mean that the 10 or 12 per cent. is due to payments from the water, or does it include the land revenue?—When I say 10 or 12 per cent. my memory may fail me; all I know is that it is a good prospect that is held out, and it means not from the land revenue, but the water cess.

10236. Mr. *Candlish*.] What was the amount of the capital of that company?—It was a million, I think.

10237. How much did we give for it?—A million, plus 50,000 l. plus 14,000 l.

10238. What was the price of the shares at that time?—It was more than 20 per cent. below par; I forget how much.

10239. Could you put in a small Return, showing the essential facts of this transaction?—Yes. —(*Vide* Appendix.)

10240. Who were the leading men of the Orissa Company?—Mr. James Thomson, the chairman of the Agra and Masterman's Bank was chairman; Sir George Pollock, Mr. Arthur Kinnaid, Colonel Grimes, and Colonel Onslow were the others.

10241. I think I understood you to say that you gave them a guarantee; that is to say, you took their shares at par, simply because they never asked for any guarantee?—No, I did not say that; what I meant was, that they being the only company that had raised money without a guarantee might be more entitled to consideration than any other portion of the public.

10242. Then if their price was 40 per cent. below par, as an honourable Member has suggested, and we gave them par, we gave them 400,000 l. more than the market price of their stock?—If we did give that price; I forget what it was.

10243. Sir *Stafford Northcote*.] With regard to this company, it was one that was established with a view to carry out a very desirable object by means of private capital, was it not?—It was.

10244. It was established at a time when a great deal of dissatisfaction had been expressed with the system of Government guarantees, and when it was the opinion of many persons in England and of some in India, that British capital might be profitably employed in India upon public works without any guarantee?—It was.

10245. And a capital of a million was raised for the purpose of carrying out works which were confessedly of great importance to India?—It was.

10246. At

10246. At the time of the Orissa famine, was it not the case that a great deal of attention was directed to the fact that the irrigation of Orissa had been very imperfectly executed?—That was a fact notorious before; but, of course, it was brought out into greater relief then.

10247. Was it not also brought out that this company, for the purpose of providing work for the starving people, and of pressing forward of these works, had expended considerable sums of money in works that were really in the nature of relief works, which they would not have executed with a view simply to the profit of the company?—That is not quite consistent with my recollection. My impression rather is this, that the Government of India, seeing that their works would provide occupation for the starving population, advanced them money which they might so lay out, but still in works which they would not have carried out if they had not been conducive to their own ultimate object.

10248. Yes, you are quite right; I had forgotten the circumstances; but in point of fact money was then laid out in the extension of their works which they were not in a position to have expended themselves?—Certainly; they had applied to the Government for advances, and they got them to a certain extent on this account.

10249. Do you remember what sum it was?—I cannot recollect; 100,000 £. or 200,000 £. I should think.

10250. Was it not a part of their contention that the expenditure of that money committed them to further works which ought, in order to make them remunerative, to be completed, but which they had not the means to complete?—I think it was a part of their contention; but we merely regarded that as a sort of lawyer's argument.

10251. Was it not also a part of their contention, and a much more important part, that the whole of their system required a much larger amount of outlay than they were able to afford, and that in order to make their system really remunerative they ought to expend a much larger amount than they had hitherto been able to expend?—Those were the facts, but they were facts for the consideration of their own shareholders; I do not think that upon these facts they would have been justified in making any appeal to Government.

10252. I am asking what their contention was; was not their contention that it was of importance for the completion of works which were admitted to be beneficial to India that a further sum should be expended, which sum they said they had not the means of raising without the assistance of the Government in the form of a guarantee?—Those facts were quite notorious. If they had brought them forward they would have brought them forward to base upon them an application for the guarantee.

10253. As a matter of fact did they not do so?—They did, and that must have been part of the argument.

10254. Perhaps you have not refreshed your memory recently with all the details?—I have not. I recollect that they did apply for a guarantee, but as it was not entertained I did not pay much attention to the grounds on which it was based.

10255. Perhaps it would be more satisfactory that before we discuss the question you should refresh your memory as to the details, and then

we can discuss it in full?—Yes, if there is anything to be gained by going into it.

10256. For instance, with regard to this Behar scheme, they had obtained the exclusive right to carry a system of irrigation works through a portion of Behar, had they not?—They had, but they had not the means of raising one penny to carry out the undertaking.

10257. But was it not of importance for the Government of India, after the warning of the famine, that irrigation works should be proceeded with, and that rapidly?—Yes, certainly, but not by private individuals.

10258. Then if it was important that those works should be proceeded with, they must either be proceeded with by the Government or by private individuals, must they not?—By one or the other.

10259. It appeared that, with regard to the Behar district, this company were not in a position to continue the works by private enterprise unless they got a guarantee; was not that so?—Quite so.

10260. And, on the other hand, the Government were not able to undertake it, because the company had possession of the field?—Yes.

10261. Therefore, if the matter had been left to stand over until the company broke down, the works might have been indefinitely postponed, might they not?—For a considerable period they might have been.

10262. Was it not the contention of the company that they were able to pay a certain dividend upon the capital that they had actually embarked, and that they believed that they should go on and continue to make a profit out of what they had done, but that they were not in a position to expend any more?—I do not think that they ever pretended that they were making profits which would enable them to pay dividends on the outlay which had already taken place.

10263. Did they not contend that they were in a position to lie on their oars if they were not required to go further?—I think they did say so, but I do not think that anybody believed them.

10264. This took place at the time that I was the Secretary of State, did it not?—Yes.

10265. And I was responsible for the arrangement that was come to?—Yes.

10266. Do you remember that it was made a subject of discussion in Parliament?—I had forgotten that.

10267. Mr. Fawcett.] Is this estimate that you have given, which I believe you say is on an official report, that the Orissa works are likely to yield 10 or 12 per cent., based on anything like accurate details?—It is based on an exceedingly elaborate and careful report.

10268. In that do they include, for instance, as an addition to their capital accounts, the number of years during which there has been no return whatever to the 1,000,000 £. which the Government paid?—I daresay they have not, but I will not be sure.

10269. Do they reckon 10 or 12 per cent. on the additional amount which the Government has spent in that way?—I think that in all probability, in counting the outlay they have not added the accruing interest.

10270. That would very much diminish it?—On second thoughts it would not, because if you recollect, with reference to the Orissa Company,

Mr. W. T. Thornton.

14 July 1871.

Mr. W. T.
Thornton.

14 July
1871.

the Government simply paid the Orissa Company a certain sum down, and therefore the arrears of interest would only be for the period succeeding that payment, namely, a year or two.

10271. Have we been correctly informed, that a portion of the Orissa irrigation works have already been opened, and may we take it that the returns yielded on the portions opened may be considered a fair sample of what the returns will be for the whole work, and also that this portion that has been opened scarcely pays its working expenses?—I am not sure, but I do not myself think that it would be correct to say that the portions which are now opened do not pay a fair interest upon the sum expended in their creation; one cannot answer these questions offhand, but I am quite certain that it is not correct to say of the greater number of portions opened that they do not pay their working expenses. My impression is that they pay a good deal more than their working expenses, but the recent receipts are no suitable data at all on which to form an estimate for the future; that is clear enough. As soon as irrigation works are opened, the ryots do not begin to take water, particularly in a territory like that where they have had very little experience of irrigation. It takes a great number of years to teach them the value of it, and the extent of land under irrigation increases every year.

10272. There is a question which I want to put to you connected with railways; supposing that there came a heavy flood and destroyed the bridges on a particular railway, and a couple of millions was required to repair them, and supposing that the revenues of the company were not adequate to provide that money, new capital would have to be raised, would it not?—New capital would not have to be raised if the general rules were followed; in such a case as that, the new bridges which would have to be made would be regarded as repairs, and if the ordinary rules were adhered to then the whole expense, whatever it might be, would have to come out of revenue. But if such an extraordinary catastrophe as that took place, it might be a question whether the ordinary rules should be adhered to, and it is perfectly possible that the Secretary of State, in a case of that kind, might allow the expense of these restorations to be charged to capital; but if he did so it would be an exceptional arrangement on his part, it would be a departure from the ordinary prescribed course.

10273. Then if all repairs come out of revenue, repairs are really paid for by the Indian Government, because owing to the fact of repairs having been paid for out of revenue, the Indian Government has to pay so much more to make up the guarantee?—If the revenue were not sufficient.

10274. But it is not sufficient, is it?—In certain cases it is; there are one or two that do pay a surplus revenue. The East Indian, for example, pays a surplus revenue, and the Great Indian has once or twice paid a surplus revenue.

10275. But in all cases where the receipts are not sufficient to pay the guarantee, you may say that not only the Government gives a guarantee of whatever the amount may be, but that it also undertakes to pay for the repairs?—It depends upon the railway: I speak a little under correction, and perhaps the honourable Member for the City of London will kindly set me right if I make a mistake; but according to the rule which was in force until lately with regard to all rail-

ways, any amount of guaranteed interest which was not paid by the earnings of the railway for that year would be set down to an account to be paid hereafter, whenever the railway should have a surplus revenue, and that is what would be done in this particular case. Supposing that a large sum had to be taken out of revenue to pay for repairs, and that the earnings of the year were in consequence not sufficient to pay the guaranteed interest, then whatever deficiency remained unpaid would be set down to an account of arrears of interest, which would be paid whenever (if that time ever came) the railway regularly earned a surplus revenue.

10276. But until that time does come, it is correct to put it as I put it, that the Government gives a guarantee of 4½ or 5 per cent. and pays the repairs also, is it not?—I think it is rather a complicated way of saying it. I think that you had better put it in this way: that the Government guarantees 5 per cent., and takes as much as the railway can give it in repayment of that 5 per cent. Of course, if the working expenses are very heavy, and if the repairs are very heavy, then the railway is able to repay less during that time; but what the Government really does pay, really does lose for the time being, is the difference between the 5 per cent. guaranteed interest which it pays and the amount of net revenue which the railway yields, and which of course is less when the working expenses are high, and when there are extraordinary expenses for repair.

10277. *Chairman.*] The honourable Member means that if the railway came to an end, and instead of earning anything, created that charge by this operation for repairs, such a deficit would be a charge upon the revenues of India of, say 5 per cent., with that special charge added to it in respect of that particular railway for that particular year?—It depends a great deal whether this increased charge is occasioned by repairs, or by working expenses.

10278. Whatever it is, if, after receiving all the income of the railway, the Government finds that it has to pay more than that income in respect of that railway for that year, then the Government for that year has to pay not only 5 per cent., but the amount of the deficit also?—Well, it is not under any absolute obligation to do that. As I mentioned in the case of the Calcutta and South Eastern, the Government of India is only bound to pay the 5 per cent. guaranteed interest, and if the railway does not pay its working expenses, the Government can insist, if it thinks proper, that the excess of working expenses shall be paid out of the guaranteed interest.

10279. That is the right of the Government, provided it exercises it?—Yes.

10280. And, thereupon, the railway company, as I understand, has the right of surrendering its line, and all its property to the Government, and then the Government has to make the best of it for the people of India?—Yes.

10281. *Mr. Fawcett.*] But I understand that in this year, 1869-70, four millions of additional capital has been raised by these railway companies, and that represents an amount not supplied by revenue, but represents additional capital?—Yes; but then this capital has been raised for construction purposes; either the railway has not been finished, or it has been making an extension, or something of that kind.

10282. But

10282. But I understood from a previous witness that a portion of this 4,000,000 £. represented money paid for new rails and things like that; the ordinary current expenses of a railway?—I can explain the thing more clearly if I give one little illustration. Now, let us suppose that the rails which cost any amount a ton, say 5 £. a ton, had been worn out, and that these rails should be replaced by rails of the same character; if they were not in any sense improved, if they were simply placed there in restoration of the worn-out rails, then those rails would be paid for out of revenue, and would not be paid for out of capital.

10283. *Chairman.* If any works were done in addition to that which tended to enlarge the railway, and make it available for other and new traffic, then that would be an expenditure out of capital?—Yes, in this sort of way: supposing that you were to make a station which had cost 10,000 £., and you found it not big enough, and you were to pull it down and build another which cost 20,000 £., you would charge 10,000 £. to capital.

10284. *Mr. Crawford.* The principles on which that was determined were settled between Lord Halifax and the railway companies, and are reduced to writing?—Yes.

10285. *Mr. Fawcett.* But putting the case which you suppose, of the station being pulled down and rebuilt on a larger scale, the additional money spent upon which you say would be put down as capital, would or would not the Government guarantee apply to that additional capital?—To any amount whatsoever, which comes out of capital directly, the Government guarantee applies.

10286. I will put a case to illustrate my point: what I wish to show is this; that the Government does really pay for the repairs of the line; suppose that the revenues of the company are 300,000 £. a year; the Government guarantee on that railway is 150,000 £. a year; its mere working expenses are 200,000 £. a year, for one particular year, we will say; that would leave the net receipts of the railway 100,000 £., and the Government would have to supply 50,000 £.: suppose that next year it is discovered that a bridge is bad, and that the railway has to pay 50,000 £., the takings of the railway remaining in the same position as before: in consequence of their having to pay 50,000 £., the position of the company would be this: receipts, 300,000 £.;

working expenses, 200,000 £.; spent upon the bridges, 50,000 £.; leaving the net amount of only 50,000 £., and the Government, instead of having to pay 50,000 £. to make up the guarantee, it would have to pay 100,000 £.; and the difference between those two represents the amount of the cost of repairing the bridges: therefore, they really pay for the repair of the bridge, do they not?—If the transaction closed in that year, I think you would be right; but then you forget that the Government have a lien upon the company for this expense; it is added to the debt which the company owe to the Government, and which they are to pay if they are ever able to pay.

10287. But my statement is perfectly correct, and remains correct until that day arrives when the company will be able to pay the guarantee?—Yes; and it is a diminution of the amount which is paid back to the Government.

10288. But it may never be paid?—Then of course it is a dead loss.

10289. *Chairman.* As regards the administration of the railway, does not the Government receive into its treasury the whole income of the railway company, and pay out of its treasury all the disbursements on account of the railway company?—In the first instance it receives the whole.

10290. And the balance, whatever it may be, remains to the credit of the Government to be applied by them in diminution of the guaranteed interest that they pay?—Of the year.

10291. Therefore in one sense the Government pay everything; in another sense they suffer the loss rather of the deficit?—Yes, undoubtedly.

10292. *Mr. Birley.* But the railway company receives a share of any surplus earnings?—Yes, where there are any.

10293. When it earns a revenue of more than 5 per cent. the railway company receives a share of the surplus?—Yes, half.

10294. *Sir D. Wedderburn.* You say that there is an account kept of these charges that are thrown upon the Government by special repairs; would the Government obtain credit for them in the event of a railway company surrendering their property to the Government, as they have, I believe, the power of doing?—In such a case as that, the Government would have to accept these as bad debts, and pay to the company the net amount of their capital; the capital that they had expended on the railway.

Mr. W. T. Thornton.

14 July 1871.

Mr. THOMAS LAWRENCE SECCOMBE, C.B., re-called; and further Examined.

10295. *Chairman.* You have not yet explained to the Committee the item of receipt "from Her Majesty's Treasury, and other public departments," 1,470,631 £. at page 2 in the Home Accounts for 1869-70; will you be good enough to go through the principal items of that amount?—The first item included in that sum is 41,326 £. received from the Crown agents for the Colonies in repayment of advances made in India on account of the emigration of coolies: In order to enable the emigration agents to meet their disbursements in India, which comprise certain payments per head on the coolies embarked, the salaries of agents, and other miscellaneous payments, as well as a portion of the remittances made by the emigrants to their families, the

0.59.

Government of India make advances to the agents, taking their bills which are forwarded to the Secretary of State for recovery. The sums so recovered amounted in the year 1869-70 to 41,326 £.

10296. For emigration, where?—To the West Indies and to Natal.

10297. Is not that emigration regulated by local Acts?—Yes, by several Acts.

10298. What is the next item?—The next item is 5,622 £. received in repayment of the expenses of Madras troops employed at Labuan. There was some time back a larger force at Labuan of Madras troops than in the year in question; in 1869 two companies only of one Madras regiment remained there, but the force is now entirely withdrawn.

Mr. T. L. Seccombe.

Mr. T. L.
Secombe.

14 July
1871.

10299. And this payment includes the expenses of keeping the force there?—Yes, that was the payment made in the year in question.

10300. The next item is what?—The next item is 12,166 £. in repayment of pensions paid in India to out-pensioners of Chelsea Hospital; the payments are made to the pensioners there, and the amount is recovered in this country from the War Office.

10301. What is your next item?—The next item is 57,391 £. in repayment of supplies to Her Majesty's ships on the East India Station. They are supplies made to the commanders and paymasters of Her Majesty's ships to meet the pay of officers and crews, purchase of stores, provisions, &c., and for contingencies. The bills are drawn upon the Accountant General of the Navy, and the recoveries amounted in 1869-70 to the sum of 57,391 £.

10302. The Government acting merely as agents?—Merely as agents; these are all remittance transactions.

10303. The last item consists of what?—The last item is the sum received in 1869-70 in part repayment of the disbursements made in India, on account of the Abyssinian Expedition; it amounted to 1,354,123 £.

10304. Does that close the account?—No, the account is not entirely closed; we are still recovering small sums. I think after this, there is no very serious item.

10305. Then with regard to the principle of exchange, on what principle do you adjust the rate of exchange between the Treasury in India, and the British Government?—In the autumn of every year we propose to the Lords of the Treasury that a certain rate of exchange shall be adopted for the ensuing year; that rate of exchange is calculated with reference to the cost of placing a rupee in India, and of a remittance to England by bills purchased in India, taking the mean of the two operations.

10306. Do you enter in the accounts the assumed profit or loss on that exchange with reference to any other standard of exchange?—We do not; it is entered in the Indian accounts only.

10307. Mr. Beckett Denison.] But for a long time (I will not say now) all these accounts were adjusted at par, were they not; that is to say, at 2 s.?—For many years.

10308. Whilst you were paying something very much more for your remittances?—Yes, the exchange stood at 2 s. frequently when we did not get 2 s. for our bills on India.

10309. Then to that extent it became an unfair charge upon the revenues of India?—Hardly so, because although in the accounts we use the rate of 2 s., the rupee has not of late years been worth so much.

10310. Chairman.] But if you paid a rupee in Bombay and the Government of England paid 2 s. here to you, were you not the gainers?—When we have received 2 s. here we have obtained a very favourable rate; we have got more than the real value of a rupee.

10311. Will you proceed to the next item?—The next item is a receipt from the agents of the Madras Medical Fund, 180 £., merely the balance in their hands.

10312. What is the "Miscellaneous" item, 96,458 £.?—Before giving the particulars of that sum I wish to explain that when we had the 2 s. rate, it was arrived at in the same manner as the

lower rate which we have at present; it was the mean between the two operations of sending silver to Calcutta and buying a bill there to remit home.

10313. It had been originally arrived at upon a consideration of those facts, but it was not annually re-adjusted?—It was fixed year by year, although for many years it prevailed at 2 s. The miscellaneous receipt of 96,458 £. comprised a great number of items, some of which had been debited to Captain Willoughby, agent in Egypt, for adjustment at Bombay in connection with the accounts of the Abyssinian Expedition, and of the Overland Troop Transport Service. It was subsequently determined that the expenditure should be adjusted in England, and consequently the credit is given here, and the payments have been included among the home charges. The head of Miscellaneous includes also a repayment by the Imperial Government on account of Mr. Rassam's Mission to Abyssinia, from September 1867 to June 1868, amounting to 6,263 £. 10 s. 2 d.; the realisations of portions of estates under the charge of the Administrator General, 4,036 £.; repayment of deposits in Regimental Savings Banks issued in India, 3,869 £.; recovery from the securities of three paymasters who were defaulters, 3,693 £.; retrenchments from officers, 2,922 £.; and a number of minor items.

10314. Then the next item on the account would appear to be 4,783,553 £. for "Indian Railway and other guaranteed companies"?—That sum comprises the gross amount deposited in the Home Treasury by those companies. They withdrew certain sums, which are shown on the other side of the account, but that was the total of their deposits in the year 1869-70.

10315. Are all the companies named in this list, the Bombay, Baroda, and Central India Railway Company, Eastern Bengal Railway Company, East Indian Railway Company, Great Indian Peninsula Railway Company, Great Southern of India Railway Company, Madras Railway Company, Scinde Railway Company (including Indus Flotilla and Punjab and Delhi Railways), Oude and Rohilkund Railway Company, and Carnatic Railway Company, carrying on their operations under contracts with the Secretary of State for India in Council?—They are.

10316. And are those contracts all on the same footing, that they are to pay all their capital into the Treasury of the Secretary of State for India in Council?—Yes.

10317. And that out of that they are to draw the sums that are necessary for paying for the construction of the railways?—For purchase of rails and materials here, and for establishment charges.

10318. And also out of that, you have to place in India under those contracts the sums that it is necessary for them to disburse in India for their works there?—Quite so.

10319. These several sums, making the total which I have mentioned, represent the deposits made by all these railway companies within the year to the Treasury in London?—They do.

10320. I think that accounts of those deposits have for the most part been laid on the Table of the House of Commons?—I believe that the contracts entered into prior to April 1859 were laid before the House of Commons, but not those made subsequently.

10321. Mr. Fawcett.] That 4,000,000 £., then, represents

represents so much added to the capital of these railways?—It does.

10322. Then 5 per cent. is guaranteed upon that 4,000,000 £, I suppose?—On the larger proportion of it 5 per cent. is guaranteed.

10323. So that this sum, which is put down each year in the Accounts under the head of receipts of the Home Treasury, of the Government Treasury, represents really an additional liability and charge thrown upon the people of India?—There is no doubt that there is a charge for guaranteed interest upon the whole amount; but this which we are dealing with now is the cash account of the Secretary of State.

10324. That is not my point. What I say is this: the mere fact that this item appears in the receipts shows that the capital account of these railways is increasing, and that the returns are not sufficient to pay the amount which the Government have guaranteed; it represents that the loss to the people of India by these railways will be increased?—I could not undertake to say that. There is no doubt that the Government has to pay the guaranteed interest upon this amount; but the question whether those railways are profitable or otherwise does not enter into this part of the account at all.

10325. Then what I come to is this; does this item which is put down as a receipt really mean that the amount which the Government have guaranteed is increased by 200,000 £?—Yes.

10326. Mr. Crawford.] It represents the reproductive capital?—The capital to be employed.

10327. Chairman.] Provided that the railways produce an income equal to the amount?—Yes.

10328. And if they do not, the difference between the guaranteed interest and that will become a charge on the revenues?—It will increase the charge for guaranteed interest.

10329. Mr. Fawcett.] You said, in reply to the honourable Member for the City, that this 4,000,000 £. represents a reproductive capital. How can you say that it represents a reproductive capital, when, as a general rule, the amount that has been spent on the railways in India represent a very heavy annual loss to the Indian Government?—I think that it is not necessary for me to show that it produces 5 per cent. to prove that it is reproductive. It is reproductive to a certain extent; in some years it may be 4 per cent., in other years more or less.

10330. But do you think, considering that the Government has guaranteed 5 per cent., and that the fact of their guaranteeing 5 per cent., has caused them a loss of a million and a half a year, you are justified in employing the general word "reproductive"?—Yes; I think that the railways are certainly reproductive, though it may not be to the amount of the interest guaranteed.

10331. Chairman.] You use the word "reproductive" in contradistinction to expenditure, which is not designed to produce anything; such as the expenditure on a fortification?—I do.

10332. Mr. B. Denison.] Can you say how the exchange is now regulated with the railway companies?—I can give the rates of exchange generally. If very precise information be required in regard to the contracts with the railway companies, I would submit that the secretary of that department should give the information; but generally in regard to the Bombay,

Baroda and Central India Railway Company, the Eastern Bengal, the East Indian, the Great Indian Peninsula, the Great Southern of India, the Madras Railway, and the Scinde Railway Companies, I believe the transactions are adjusted at the rates of 1 s. 10 d. the rupee, and those of the Oude and Rohilkund, as well as the Carnatic, at 2 s. the rupee.

10333. Under their terms of contract?—Yes.

10334. It does not vary with each year?—No.

10335. I suppose that there would be no objection to placing before us a statement, showing in a condensed form the profit and loss on the exchange from the beginning, with the railway companies capitals?—No.

10336. Mr. Fawcett.] Does this 4,000,000 £, which is put down under the head of receipts from the railway companies, represent the whole additional amount of capital on which from year to year the Government give a guarantee in regard to railways?—The whole amount received in the year under consideration, namely, 1869-70.

10337. All the new capital on which the guarantees, say 5 per cent., applies, must have been paid in to the India Home Government?—No; it is open to proprietors to pay in India, but very small sums only have been paid there.

10338. But is all the additional capital, for instance, which is required for the repair of bridges and the renewal of works, paid into the Indian Home Government, and is a guarantee of interest given upon that, 4½ per cent., or whatever the guarantee is?—Yes; the whole amount added to the capital of the several railways must be paid into the Government Treasury, and they withdraw such portions as they require.

10339. Mr. Crawford.] The repairs of bridges and the renewal of works are paid out of revenue, are they not, not out of capital?—Certainly.

10340. Therefore, the money is supplied out of the earnings of the railway in India?—Yes.

10341. Sir D. Wedderburn.] You said that you would be able to inform me how the expenses connected with the solar eclipse were apportioned; can you do so now?—They were apportioned equally between the Imperial and the Home Governments both with regard to the expenditure in India and with regard to that in England.

10342. I see in these Accounts a variety of items which are apportioned between the Imperial Exchequer and the Indian, and I should like to know whether there is any general principle on which those apportionments are made; is any general principle adopted?—There is no general principle laid down; the charge would be adjusted according to the agreement entered into in each case as it arises. In regard to the solar eclipse, the expenditure in this country was 1,083 £; the expenditure in India 1,835 £, amounting together to 2,918 £; and the Treasury paid a moiety.

10343. On the ground that it was for the benefit of India as well as for the benefit of the empire in general that these observations were made?—Yes.

10344. Mr. Grant Duff.] You put in a Paper, do you not, with a comparative view of the Indian and Imperial Estimates?—Yes. (*The Paper was handed in, vide Appendix.*)

Mr. T. L. Seccombe.

14 July 1871.

A P P E N D I X

Appendix, No. 1.

PETITION of Members of the Bombay Association and other Native Inhabitants of the Bombay Presidency in British India.

Appendix, No. 1.

To the Honourable the Commons of Great Britain and Ireland in Parliament assembled :

The Humble Petition of the undersigned Members of the Bombay Association and other Native Inhabitants of the Bombay Presidency in British India,

Most Respectfully Showeth,

THAT your Petitioners, who are British subjects residing in Her Majesty's Indian territories, beg leave most respectfully to approach your Honourable House for the purpose of presenting to your Honourable House a statement of their grievances, and humbly, but earnestly, to solicit that such measures may be taken to redress the same, as your Honourable House may deem to be expedient.

2. That in the first place your Petitioners desire to express their gratitude for the numerous blessings and advantages which, in common with the generality of their countrymen, they have the good fortune to enjoy under the British rule. In making known their grievances, and beseeching Parliament to redress the same, your Petitioners are not actuated with any feeling of discontent with the rule to which Providence has entrusted the destinies of 150,000,000 of your Petitioners' countrymen and fellow-subjects. Whilst emphatically disclaiming any such feeling, your Petitioners beg to avail themselves of the inestimable privilege which they enjoy, as loyal subjects of the British Crown, of making known their just complaints to your Honourable House. In making this appeal your Petitioners are encouraged by the following assurance, contained in the Proclamation issued by Her Most Gracious Majesty the Queen to the people of India on Her Majesty's assumption of the direct sovereignty of Her Indian territories in the year 1858 :

"It is our earnest desire to stimulate the peaceful industry of India, to promote works of public utility and improvement, and to administer its government for the benefit of all our subjects resident therein. In their prosperity will be our strength, in their contentment our security, and in their gratitude our best reward."

3. Your Petitioners would beg to invite the earnest attention of your Honourable House—

I. To the state of the finances, and the financial administration of British India.

II. To the disposal of the revenues of India by the authorities in England ; and

III. To the adjustment of the financial relations subsisting between England and India, on a just and equitable footing.

I.—4. The affairs of the financial department of this country have of late years been conducted with such negligence and extravagance as to produce within the short period of four years ending in 1869-70, a deficit equal to 11,514,628 £. This large deficit has not been caused by a decline in any of the ordinary sources of revenue, nor by the occurrence of any extraordinary emergency, such as war or other calamity ; but it has been produced, your Petitioners regret to say, by excessive expenditure and mismanagement. During the

Appendix, No. 1.

last 13 years the revenues of India have shown remarkable elasticity, and have increased from 33,000,000 £. to 52,000,000 £. sterling; but the public expenditure, instead of being kept within proper bounds, has been so much enhanced from year to year as not only to absorb the whole amount of increased revenue, 19,000,000 £., but also to produce the large deficit which has involved the finances in a state of serious embarrassment. In order to supply the annual deficits which occur, and to restore an equilibrium, the Government of India has resorted to the expedient of increasing several of the existing taxes, and has imposed a most odious war-tax, in the shape of the income-tax, which was last year suddenly increased to 7½ d. in the pound. These extraordinary proceedings have produced universal discontent and dissatisfaction amongst all classes of Her Majesty's subjects throughout the whole extent of the British Indian territories. The aggregate burden of taxation has now become so heavy as to be almost intolerable. It has culminated in the levy of the income-tax, which your Petitioners consider to be most unjust and oppressive, and productive of extensive corruption, demoralisation, and extortion; a tax, moreover, which has been condemned by the highest authorities, including most of the finance ministers for India, and almost all the governors and official representatives of the Indian Presidencies and Provinces. Your Petitioners, in appealing to your Honourable House to be relieved as much as possible from the excessive taxation to which they have of late been subjected by the Government of India, sincerely trust that your Honourable House will express your disapprobation of the mode in which the financial administration of India has hitherto been carried on.

5. Your Petitioners proceed to draw the attention of your Honourable House to the following facts connected with this very important department of the State.

6. A comparison of the public expenditure in India in the year 1856-57, with the amount now disbursed, will show that in the short term of 13 years, there has been an increase under that head of more than 20,000,000 £. sterling. In almost every department of the State, the expenditure has increased from year to year. Your Petitioners more particularly refer to the Revenue, Public Works, Military, and "Home Departments," in which the increase has been excessive. Your Petitioners humbly submit that for such excessive increase in expenditure no valid reasons can be assigned.

7. Your Petitioners would also request the attention of your Honourable House to the fact that the embarrassments of the finances of India are attributable chiefly to the want of an efficient check to prevent the constant increase of expenditure and taxation in India, and to the absence of all control over the disbursements of the Indian Treasury made by Her Majesty's Secretary of State for India in Council. Your Petitioners therefore submit to your Honourable House the necessity of providing a proper safeguard against the recurrence of this great evil.

8. According to the present system of Government, the different classes of Her Majesty's Indian subjects have no effective voice in the imposition of taxes, the disposal of the revenue, and the enactment of laws. There is a sort of faint and nominal representation in the Supreme Council, which, however, only militates, in your Petitioners' opinion, against its usefulness as a representative council. Two natives, often not conversant with the English language, in which the proceedings of the Council are conducted, together with two non-official Europeans, selected from the mercantile class, are admitted to the Supreme Legislative Council of India. The former being usually selected from the class of feudatory native chieftains, and not being acquainted with the condition and wants of the generality of the people under the British rule, and possessing no direct interest in the important matters that come up for consideration before the Council, cannot be said to be fit and proper persons to represent the inhabitants of India. Moreover nearly all of these non-official members are unable to take even a nominal part in the deliberations of the Council during a great part of the year, when its sittings are held at the remote hill-station of Simla. The preponderating and influential majority of this assembly (besides the three official members) consists of eight members of the Executive Government, who frame the Budget, and formally introduce it into the Supreme Council. The small number of non-official members do not therefore possess any power to revise, reduce, or reject any of the items of ways and means and expenditure.

9. Your Petitioners therefore respectfully submit to your Honourable House the advisability of abolishing the present empty form, and substituting a scheme of effective representation in the Supreme Council, by re-organising and enlarging that body and admitting a sufficiently large number of representatives of the people. With this view your Petitioners venture to submit the following proposal for the consideration of your Honourable House:—

10. Subject to control on the part of Her Majesty's Secretary of State for India in Council, the Government of India might be allowed to continue to exercise the power it now possesses annually to fix and set apart the amount that may be found to be necessary for the diplomatic and military services of the Indian Empire. The imperial charges necessary for enabling the Supreme Government and Her Majesty's Secretary of State for India to carry out and maintain all imperial objects, such as the army, marine, post-office, electric telegraph, interest on the public debt, railway capital, and loans for public works extraordinary, &c., pensions, allowances, assignments, &c., should be accurately defined and provided for; and the contributions which each Presidency, lieutenant-governorship, and administration should be called upon to make to the Imperial Government, should be fixed in the Budget. After making this provision the residue of the revenues of each Presidency and

and province should be left to its own management and disposal for the purposes of its administration, subject to the general control of the Supreme Government. To guard against any apprehension of fresh schemes of unnecessary taxation being devised by the provincial governments for local purposes, your Petitioners submit that it is desirable to impose a check upon the further increase of such burdens. With this view the local authorities should be restrained from the levy of fresh taxes, except with the previous sanction of the Government of India, on a representation of the necessity for such levy. The procedure in regard to the Budget should be assimilated, as much as possible, to the plan adopted respecting the Budget of the United Kingdom, on its introduction into your Honourable House. The Imperial Budget of India, with which the budgets of the local presidencies and administrations might be amalgamated, should be framed by the Finance Minister, published for general information, and brought forward annually, and every item of ways and means, and of the estimates, should be fully discussed by the members of the Supreme Council, with liberty to reject, revise, or pass the same by the votes of the majority. The same course should, your Petitioners submit, be adopted by each of the local governments in regard to local budgets to be introduced into the local legislative councils. With a view to enlarge their powers and increase their efficiency, it is necessary to re-organize and enlarge the local legislative councils also by the admission of a greater number of duly qualified non-official members, representing the interests of different classes of the local community. By adopting this plan, a salutary check will, your Petitioners conceive, be provided against the increase of expenditure and taxation, and an adequate voice will be given to the people in the imposition of taxes, the disposal of the public income, and the enactment of laws.

11. Your Petitioners regret to say that, owing to want of judicious management on the part of the functionary selected by Government to superintend the Financial Department and frame the annual budget for British India, your Petitioners have of late been subjected to unnecessary burdens of the most objectionable character. If the revenue had been properly estimated, there would have been no ground for apprehending the large deficit which an erroneous estimate had created, and there would have been no necessity for making an enhancement in the income tax to $3\frac{1}{2}$ per cent. last year. In the same way taxation was also enhanced during the year 1869-70, on the anticipation of a deficit of 625,594 l. which did not really occur, the year having resulted in a surplus of 118,668 l.

12. The state of the revenue this year being more favourable than was anticipated, has enabled the Government of India to give some relief to the public by reducing the income tax from $3\frac{1}{2}$ per cent. to 1 per cent., and exempting all incomes under 75 l.; but your Petitioners respectfully submit that the effect of that relief will be neutralised by the reduction that has been made in the amount allotted for the services of the several departments of the administration lately made over to the local Governments, entailing on them the necessity of imposing fresh taxes. Your Petitioners view with anxiety and alarm the consequences likely to result from the permission thus accorded by the Government of India to local Governments to raise additional funds by means of local taxation to supply the deficiency just referred to. As proof that substantial reasons exist for this apprehension, your Petitioners would respectfully call the attention of your Honourable House to the fact that the Government of Madras has just passed Acts for the levying of two local taxes throughout the whole extent of that large Presidency. In the North Western Provinces, the Punjab and Oude, plans have been matured for imposing additional taxes on the people residing in those territories, and projects of fresh taxation are under consideration for the Bengal and Bombay Presidencies.

13. Your Petitioners would also respectfully represent that it is a well-known fact that lavish, wasteful and enormous expenditure in the Public Works Department has contributed in no small degree to produce the deficits in the Financial Department of the State. Public buildings, constructed at a heavy and ruinous cost have crumbled and fallen to the ground, and public works of all kinds have been undertaken with an outlay of public money much greater than with proper management was requisite. Many magnificent palatial barracks have been constructed at an enormous cost in different parts of India, but in utter disregard of the wants and circumstances of the country, the peculiarities of its climate and other important considerations. The entire cost of these stupendous permanent edifices, amounting to upwards of five millions, has been defrayed out of the current revenues. Several of these works were so badly constructed as to necessitate their being pulled down or repaired and propped up, whilst many of them have proved complete failures, and have had to be abandoned as unfit for the purposes which they were intended to serve. The failure of the Public Works Department being undeniable, it is necessary, your Petitioners submit, to make a radical change in its organisation with a view to substitute a good, simple, and economical system with well-defined responsibility, in supersession of the present costly, cumbersome, and irresponsible agency, which has entailed such serious losses on the country.

14. Whilst respectfully insisting on the practice of rigid economy in the financial administration of India, it is far from your Petitioners' desire to advocate the adoption of a short-sighted policy, and to ask for any curtailment of a judicious and adequate outlay of public money for educational purposes, or for the construction of approved public works of a remunerative nature, which are necessary for developing the resources of the country and promoting the happiness of the people; but your Petitioners trust your Honourable House

Appendix, No. 1.

will disapprove of the practice of drawing from current revenue the whole amount of expenditure necessary for such public works, and thus throwing the entire burthen on the present generation. Works for the benefit of future generations should, your Petitioners submit, be paid for out of terminable loans, so as to spread their cost over a number of years.

15. Although the imposition of the income tax has produced extreme dissatisfaction, and this obnoxious measure has, in its practical operation, been productive of very great annoyance, injustice, and oppression throughout the whole extent of Her Majesty's Indian territories; and, although this year has yielded the largest amount of revenue ever yet raised in British India, being 1½ million in excess of the estimate, yet your Petitioners are mortified to learn that the Government of India have resolved to retain this hateful tax though at a reduced rate, which is estimated to yield 600,000 £. To enable the Government to raise this paltry sum, a Bill for re-imposing the income tax has already been introduced into the Supreme Legislative Council. Instead of reserving this "mighty engine of finance" for an extraordinary emergency, the Government of India appear to have resolved to make it an ordinary and permanent source of revenue, a proceeding utterly at variance with recognised principles of a wise and economical administration of the finances.

16. Your Petitioners desire to draw the attention of your Honourable House to the fact that not a single native was present in the Supreme Legislative Council to represent 150 millions of Her Majesty's Indian subjects when the budget and the proposal to retain the income tax were discussed on the 17th instant, and that nearly all the official members appointed by Government to represent the different presidencies and provinces, and both the non-official European members, who represent the commercial interests of India, remonstrated against the impolicy of the proposed retention of the income tax, but in vain. The proposal was carried by the members of the Executive Government, who paid no attention to the protest urged against that objectionable measure.

17. In the Budget of 1871-72, just submitted to the Supreme Council, the Government urge the following excuse in favour of the retention of the income tax:—

"The one per cent. income tax which we retain is manifestly indispensable, inasmuch as "without it we should have to produce a budget with a deficit, which is an alternative not "to be adopted so long as any legitimate or reasonable resource may remain to us."

18. Your Petitioners submit to your Honourable House the undermentioned facts and circumstances, which, they trust, will be deemed sufficient to satisfy your Honourable House that the continued infliction of the obnoxious income tax is totally indefensible. The efforts of the Government of India have of late years been directed chiefly towards enhancing the existing imposts, and seeking new sources of taxation in this country. During the last 12 years, the salt tax has been raised 100 per cent. in Madras, 81 per cent. in Bombay, and 50 per cent. in other parts of India; the duty on sugar has been enhanced 100 per cent., the abkaree or excise on spirits, 100 per cent., the stamp tax has been repeatedly revised and enhanced, and is now so complicated, vexatious, and excessive, as frequently to lead to a denial to justice;* customs duties have been increased several times; heavy court fees, and a succession tax of 2 per cent. have been recently imposed; a local land cess of 6½ per cent.; village service cess at the same high rate; rural towns cess, taxes on trades and callings, house tax, tolls, and a considerable variety of municipal and local rates and taxes, amounting in the aggregate to an extremely large and oppressive sum, have been levied in different parts of the country.† It is now proposed to impose fresh local taxes to supply the deficiency caused by the conduct of the Government of India in curtailing the grant for several provincial services. Your Petitioners submit that over-taxation has, for many years of British rule, been the bane of India, and that strenuous endeavours have not been made by the authorities to reduce the public expenditure, which has been increased from year to year until the augmentation now amounts to the vast sum of 19 millions over and above the expenditure of 1856-57. Even during the two last years of extreme financial distress, no reductions have been made except in the Police Department, and a considerable curtailment of the expenditure on public works ordinary. On the contrary, the expenditure in the Land Revenue, Forest, Salt, Opium, Post Office, Telegraph, Ecclesiastical, and Administration Departments has been increased to the extent of more than two millions, and the retrenchment of half a million proposed by Government in the Army Estimates of last year, has not been carried out. In the course of the next year, it is proposed to make an additional retrenchment of more than one-third of a million in the grant for public works ordinary, and to make two insignificant reductions of 178,000 £. in the enormous expenditure kept up in England (amounting to upwards of 12 millions per annum), and 316,000 £. in the huge military expenditure of India,‡ which absorbs more than

* The stamp revenue has been enhanced from 622,165 £. in 1857 to 2,441,508 £. last year, being an increase of 400 per cent.

† In the Financial Statement made before the House of Lords on the 23rd July 1869, the present Secretary of State for India, the Duke of Argyll, declared that of the increase of 15 millions which had taken place in the revenues of India during the previous 10 years, "7,301,620 £. was due to sources of revenue on which there had been increased or new taxation."—(Hansard's Parliamentary Debates, vol. 198, p. 522.)

‡ The Budget for this year refers to considerable retrenchments in the Army Estimates, but they are neutralised by a considerable increase in several items, which reduces the net saving to the paltry amount above referred to.

than one-third of the entire revenues of the country. Thus, your Honourable House will perceive that even at a critical period like the present, no serious attempts have been made by Government to give adequate relief to the people of India by making extensive reductions in the excessive and ruinous public expenditure which is persistently kept up to the manifest injury of the interests of British India.

19. Your Petitioners venture to bring to the notice of your Honourable House the conduct of the Government of India, in connection with the enhancement in September 1869, of the heavy duty imposed on salt. Your Petitioners have no special objections to urge against this indirect tax, so long as it is kept within reasonable bounds; but your Petitioners respectfully remonstrate against the propriety of the fresh enhancement made in September 1869, of a tax which had before been repeatedly raised until it had already reached the highest limit, and beyond which it does not admit of being enhanced without injury to the vast majority of the people, who are so poor as to be unable to bear the present increased cost of that necessary of life, taking into consideration the high price of all the other necessaries of life. Thus the salt-tax now presses very heavily on the poor, and in a large majority of cases their means are so wretchedly limited as to prevent them from procuring more than half the quantity absolutely required for health. Your Honourable House will, on inquiry, your Petitioners believe, feel convinced that the present excessively heavy tax on salt checks its consumption; and that, independent of other considerations, the dictates of humanity alone ought to induce the Government to refrain from imposing on the mass of the people an enormous tax, amounting on an average to 1,000 per cent. on the cost of production. In confirmation of these views, your Petitioners would respectfully call the attention of your Honourable House to the following declaration made by the Right Honourable Mr. Massey, late Finance Minister of India, in the Budget for 1867-68:—

“It is no doubt true that an addition to the salt-tax, which would yield a considerable revenue, might be easily levied without any cost of collection; and it has been confidently asserted that such an addition would not be oppressive to the people, whose condition has been materially improved by the rise in the value of labour within the last few years. But the enhanced wages of labour have prevailed chiefly in the Presidency towns and the surrounding districts, and have not extended to the great mass of the population, upon whom the pressure of the salt-tax almost entirely falls. The custom and excise duties on salt amount to 5,500,000 *l.* sterling; and if you leave out the land revenue, which is not so much a tax as a rent, and the opium returns, which are not paid by the people of India in any form, nearly one-third of the revenue is drawn from the great mass of the labouring people, whose wages, on the whole, have not risen beyond the rise in the cost of the necessaries of life.”

20. Your Petitioners would press on the attention of your Honourable House the military expenditure of India, forming “a gigantic item,” which (to use the language of the Honourable George Campbell) “swallows up our revenues in a proportion far exceeding anything known in any other country in the world.” This expenditure, which was less than 12,000,000 *l.* in 1856-57, amounted last year to 16,300,000 *l.*, a sum which is equal to one-third of the entire revenues of India. This is exclusive of a large amount spent on military works, such as the building and repair of barracks and military roads, which are included under the head of “Public Works,” the cost of Army chaplains, which is included under “Ecclesiastical Establishment,” and other charges, which together bring up the aggregate cost of the Indian Army to the vast sum of 18,000,000 *l.* sterling.*

21. Your Petitioners respectfully submit that no necessity exists for this heavy drain on the resources of the country; and they earnestly entreat your Honourable House to direct that immediate steps should be taken to make a considerable reduction in these enormous military charges. And in support of this prayer your Petitioners would beg leave to refer your Honourable House to the testimony of Sir C. Trevelyan, late Finance Minister for India, and of the present Secretary of State, and Under Secretary of State for India. The first-named gentleman, in his recent address on the subject of the finances of India, made the following important declaration on the 27th July last:—

“I will confine myself to three examples of the prevailing disregard of financial consideration. First, the Army. Although the great native military Powers which formerly balanced our own, Runjeet Sing, Gwalior, Oude, and Hyderabad, have been extinguished or disarmed, and all the remaining Native States have been conciliated, and attached to our interests, though our great Bengal Sepoy Army, which required a large European and Native force to look after it, has disappeared, and we have drawn the teeth of the Native States by depriving them of their guns; though our Army now reigns supreme, and unrivalled, and one regiment is able to do the work of ten by the formation of railways; and lastly, and chiefly, although the people of India have entered upon a course of educational and industrial improvement which is quite incompatible with their former revolutionary aspirations, the military expenditure, according to the Budget estimate, is 15,745,341 *l.* It

* Some of the duties devolving on the regular army have been transferred to the Military Police Establishment, lately organised on the model of the police force of Ireland, costing 2½ millions per annum.

Appendix, No. 1.

It therefore absorbs nearly a third of the gross revenue. This is more than the ordinary military expenditure of the great military monarchies of Europe, and, above all, it is more than the military expenditure by which England maintains the security, not only of these Islands, but also of the whole of the British Colonies, including Canada, exceeding, if not in population, at any rate in extent of territory, and in the formidable character of the Powers by whom they might be assailed, the whole of British India. The net charge for the British Army this year is 11,762,200 £, while the estimated net expense of the Indian Army is 15,009,116 £, or 3,983,141 £ more."

22. In a Despatch sent to the Government of India, dated 2nd December 1869, the Right Honourable the Duke of Argyll declares:—

"The necessity of effecting every practicable reduction of expenditure was fully apparent to me when my financial Despatch of the 2nd January last, No. 62, was written. In that Despatch I called your attention to the military charges, and stated the grounds on which I considered that those charges should be reduced to at least the scale of 1863-64, and that it might be possible to bring the whole military charges in India, including stores, a million and a-half below the present amount."

23. Mr. Grant Duff, Under Secretary of State for India, in the Budget Speech delivered by him before your Honourable House on the 3rd August 1869, speaking of the Indian Army, acknowledged that "its weakest part was its enormous cost." Later, in the course of the financial statement which he submitted to your Honourable House on the 5th August, last he declared that the first great line on which "our financial policy should be built was military reduction."

24. The enormous increase in military charges is attributable, not to an increase in the aggregate number of troops employed in India,* but, amongst other causes, to immense sums of money being lavished on military stores, transport of troops, keeping up separate chief military commands in each Presidency, the maintenance of large regimental depôts in England, the extravagant arrangements made by the authorities in England on the amalgamation of the late East India Company's troops with the Royal Army, and the ruinous scheme sanctioned for granting promotion to European officers of the Staff Corps, entailing on the Indian revenues enormous charges for "non-effective" service, which liability must go on increasing from year to year until near the close of this century, during which period, it is estimated that an aggregate sum of sixteen to twenty millions sterling will be sacrificed over and above the excessive amount now disbursed on account of military charges. Some of these charges may, your Petitioners submit, be totally abolished, whilst others may be considerably reduced without impairing the strength and efficiency of the military forces employed in India. Your Petitioners regret to learn that the control exercised over this disposal of the Indian Army by the Department under His Royal Highness the Commander-in-Chief in England often operates prejudicially to the interests of the Indian Treasury. Your Petitioners therefore solicit your Honourable House to devise and adopt suitable measures, with a view to reduce the enormous military expenditure of India, and to keep it within proper limits, so that it shall bear a fair and reasonable proportion to the income of India.

II.—25. Your Petitioners would now respectfully invite the attention of your Honourable House to the disbursements made in England out of the revenues of India by Her Majesty's Secretary of State for India in Council, and to the immense increase which has taken place therein during the last thirteen years, amounting to 10 millions.

26. The increase in some of the items, such as guaranteed interest payable on railway capital and loans borrowed for Public Works Extraordinary, &c., can be justified but when these funds are carefully spent on desirable works; but your Petitioners submit that many of the charges paid in England out of the revenues of India will, on inquiry, be found to be excessive, and several of them without reasonable justification.

27. Instead of practising rigid economy, and making use of private enterprise for the conveyance of troops to this country, a highly expensive overland troop-transport service has been lately organised, costing more than a million for ships, and 320,000 £. per annum for the maintenance of the service, besides a further annual charge of nearly 100,000 £. for the passages of officers and troops. If this costly service be abolished, and if a proper system of transport by public competition be substituted, the service could, your Petitioners firmly believe, be efficiently performed at about half the present cost. The system under which stores are sent out from England is open to the same objection; their ultimate cost is excessive, and entails a heavy loss on the State. During the last five years there has been an increase of 50 per cent. in the charge for stores. On inquiry, your Honourable House will, as your Petitioners believe, find that there has been a great increase in the expenditure of "the Home Treasury" of the Government of India in many departments which admits of considerable reduction. Although the marine charges of India amount to three-quarters

* Since the year 1850-57 the Native army has been reduced by 110,000 men, and the European army has been increased by 10,000 men. Notwithstanding this aggregate reduction in the numerical strength, the military charges have been enhanced by five or six millions per annum, or 50 per cent., without any commensurate gain to the efficiency of the force.

quarters of a million per annum, the Indian Treasury is unfairly made to contribute towards the expenses of vessels belonging to Her Majesty's Navy, on the plea of their being employed to survey in the Indian seas, Persian Gulf, and other Asiatic waters.

III.—28. Your Petitioners beseech your Honourable House to take into your earnest consideration the importance of placing the financial relations between the Government of India and the Imperial Government on a just and equitable footing. Your Petitioners grieve to say that India has for a series of years been treated with injustice, and that items of expenditure, and charges which ought to have been provided for entirely from the Imperial Exchequer, or distributed in equal proportions between India and England, have been entirely defrayed out of the revenues of India.

29. To illustrate their meaning, your Petitioners would respectfully ask the attention of your Honourable House to the treatment adopted by the Imperial Government towards the colonies, which presents a singular contrast to the treatment of an empire like that of India, which adds immensely to the power, dignity, and influence of England in all parts of the world. England has not charged a shilling to the Colonies for the heavy cost of conquering and defending those possessions, whilst India has been charged with the entire cost, not only of conquering and defending these territories, but also the whole cost, and in several cases half the cost, of many protracted wars waged in pursuance of a British policy, with which the interests of India were but remotely concerned. The whole cost of the Colonial Office, and the greater portion of the costs of the military defence of the Colonies, including Ceylon, amounting to a large sum, are borne by the Imperial Exchequer, whilst the entire cost of the India Office establishment has been charged to the revenues of India. India has been charged not only with the cost of all the troops supplied to her from England, but also with the cost and charges of their maintenance in England for several months prior to the date of their dispatch. The expenses, ranging from 500,000 £. to 1,000,000 £. per annum, of large depôts of troops maintained in England, and serving as part of the garrison of Great Britain and Ireland, have all been charged to the Indian Treasury. During the last two years a new charge of 70,000 £. per annum has been imposed on the Indian Treasury "as a contribution towards the expenses of Her Majesty's ships" employed in the Indian seas, as well as in other parts of the East. Your Petitioners submit that India should be relieved from this charge, and should not be made to contribute towards the cost of the naval squadron maintained by Her Majesty's Government for the protection of English commerce, and for the support of the supremacy of England. The cost of Her Majesty's establishments in China, and of the Missions maintained in Zanzibar and Persia for Imperial purposes, are charged to India, although these establishments and missions are placed under the departmental control of Her Majesty's Secretary of State for Foreign Affairs. Until lately India was compelled to bear a moiety of the amount of loss annually accruing to England for the conveyance of Her Majesty's mails to Mauritius and to Australia; and up to the present time half the loss resulting every year on account of the Mediterranean, Egyptian, Ceylon, and China mails has been charged to the Indian Treasury.

30. In addition to the above, your Petitioners would most respectfully draw the serious attention of your Honourable House to the following heavy charges with which the finances of India have been burdened.

31. In the year 1834, when Parliament thought proper to deprive the late Honourable the East India Company of the monopoly of trade which they exclusively carried on with the East, a great boon was conferred on the merchants of Great Britain by thus declaring the trade free and open to all; but India has since been burdened with an annual charge of 629,970 £., being interest on the amount of compensation granted to the said Company for the loss of their monopoly. In the official accounts this charge is designated "Dividends to Proprietors of East India Stock." Although the original capital stock of the Honourable East India Company, 6,000,000 £. had, your Petitioners are credibly informed, been swept away by losses sustained by the Company; and although the Company had received dividends, amounting to 23,000,000 £. from the Indian Exchequer, Parliament in 1834 awarded to the said proprietors of East India Stock the sum of 629,970 £. to be paid to them annually out of the revenues of India as dividend on that Stock; and in addition directed that in the year 1874, these proprietors should be paid the original amount of the Company's capital, 6,000,000 £., and should receive besides another sum of 6,000,000 £., thus granting them the extravagant sum of 12,000,000 £.,* although the Company had during their administration of the affairs of India contracted a debt of from 50 to 60 millions sterling, which has unjustly been treated as part of the public debt of India. Your Petitioners most respectfully, but most earnestly, beg to remonstrate against this charge. Your Petitioners submit that a charge like this, incurred not for the advantage of India, but for the purchase of the privilege of open trade with the East for the express benefit of the merchants of Great Britain, should, in common fairness and justice, be at least equally apportioned between India and England, if not wholly transferred from the Indian Treasury to the British Exchequer. No reasonable plea can, your Petitioners submit, be urged in favour of the equally unjustifiable proceeding by which the revenues of India were charged 150,000 £. a year

* The sum of 2,000,000 £. was taken from the revenues of India in the year 1838, and invested in the English Funds as security for the payment of the said sum of 12,000,000 £.

Appendix, No. 1. year for the award of "compensation annuities," for closing the late East India Company's commercial establishments at Canton and other places, and other large sums which have been charged to India for the expenses of the said Company's establishments at St. Helena, Bencoolen, Malacca, and Prince of Wales' Island.

32. A very considerable portion of "the Public Debt of India," amounting last year to 102,866,189 £, and forming an annual charge of 5,025,014 £ on the revenues of India, has been incurred for defraying the cost of wars carried on beyond the frontiers of India for Imperial purposes, and by the express orders of Her Majesty's Government. Your Petitioners would refer for example to the Affghan War, of which the entire cost, amounting, it has been computed, to 20 millions sterling, has been thrown on the revenues of India; a war which was forced on the Government of India by the English Cabinet against the remonstrances of the late East India Company.*

33. In short, your Petitioners are constrained to represent that, from the expenses of a ball given to the Sultan of Turkey to the charge for the maintenance of lunatics in England, and the costs of presents given to members of the Zanzibar Mission, every charge, with which the name of India can be connected, is fastened on the Indian Treasury, which has gradually been so much exhausted that, with much difficulty, it can bear the increased pressure put upon it from year to year.

34. In confirmation of the complaint that India is treated with unfairness by the Imperial Government, your Petitioners are able to adduce the testimony of the undermentioned high authorities. Her Majesty's late Viceroy and Governor General of India, Lord Lawrence, made the following observations when the Secretary of State for India made the financial statement in the House of Lords on the 28th of June last:—

"It was felt that there were some items which were unfairly charged against the revenue of India. Last year he protested against the charge made upon India in reference to the Abyssinian War, and now he would mention two or three other items. Some years ago there was established a line of telegraphic communication between England and India, and the whole expense of that line, upwards of 1,000,000 £, had been charged against the revenue of India. That seemed to him to be very unjust. The advantage had been very great to England, and each country should have paid half the expense. In the nature of things the line was one that would never pay. He thought, also, that the charge for supplying India with troops should not be higher than was absolutely necessary; that was, that the charge should be upon the lowest scale. Further, he did not see why India should pay anything on account of our establishment charges in China. All these items made up a large sum; but the question was not so much the amount of money as the feeling that the charges engendered in India. Whilst the Englishmen exiled in that country complained of the income-tax, the whole people of India complained that novel taxes were levied upon them, and that in certain instances they were paying more than they should pay for charges in England, and these things caused great dissatisfaction."

Sir Charles Trevelyan and Mr. Laing, late Finance Ministers for India, and Sir George Wingate, late Revenue Survey Commissioner of this Presidency, have recorded similar testimony, to which your Petitioners beg to refer your Honourable House.

35. Whilst the acquisition and defence of the Colonial dominions of the Crown have cost the Imperial Exchequer, as your Petitioners have been assured, an enormous sum of money, the fact is incontrovertible that the vast Indian Empire, which is justly regarded as the brightest jewel in the Crown of Great Britain, has been acquired and maintained up to the present moment without entailing the smallest charge on the British nation. This consideration, coupled with the many valuable benefits and advantages reaped by the British from their connection with India, will, your Petitioners sincerely trust, be deemed sufficient to induce your Honourable House to apportion the cost of perpetuating that connection, alike profitable to the rulers and the subjects, and adjust the financial relations between India and England upon an equitable basis. With this object your Petitioners humbly beseech your Honourable House to grant such relief as may appear just and necessary for the purpose of extricating the finances of India from the state of embarrassment in which they have become involved, and diminishing the excessive and increasing drain upon the resources of this impoverished country.

36. Your Petitioners submit that by an act of justice it is in the power of Parliament to afford immediate relief to the Indian Treasury to a considerable amount. The high rate of interest, payable every year for the public debt of India, forms a heavy charge on the revenues of this country. By giving an Imperial guarantee for this debt, and converting it into consols, there will be a clear annual gain of about 1½ millions, which, if formed into a sinking fund, or invested in reproductive public works, would liquidate the whole debt within a definite period. This debt, your Petitioners submit, cannot any longer be regarded as only an Indian liability. Her Majesty the Queen having assumed the direct sovereignty of India since the year 1858, Her Indian territories have become part and parcel of the British empire, and have thus become subject to all the liabilities attaching to them.

Moreover,

* V. Third Report of the Select Committee of the House of Commons on Indian Territories, 1858, p. 49; and Sixth Report of the Select Committee of the House of Commons, 1863, Appendix, p. 193.

Moreover, in the course of the debate, which took place in your Honourable House on the subject of the East India Loan in the year 1859, the Right Honourable Lord Halifax, then Secretary of State for India, made this important declaration:—

“If we take away Indian revenue by Imperial legislation, we incur not merely a moral, but a positive liability.”

On the same occasion, the Right Honourable the Earl of Derby, then Lord Stanley, is reported to have made the following observations:—

“I would ask the House seriously to consider how far, looking at the fact that more than 50,000,000 £ has been contributed by English capitalists, it would be morally possible for this country altogether to repudiate the Indian debt without shaking its own credit? I would likewise ask the House to bear in mind that if ever the time should come when the established policy in this respect should undergo a change, and when a national guarantee should be given for these liabilities, that guarantee would operate to reduce the interest paid upon the Indian debt by no less than 750,000 £ or even 1,000,000 £, which, formed into a sinking fund, would go far to pay off the whole.”

37. This act of expediency, if not of justice, is, your Petitioners submit, not calculated to entail any burden on the Imperial Exchequer, nor expose the British nation to any real risk.

38. The consequences resulting from the mistaken policy on which the Government of India is now conducted are, your Petitioners grieve to say, deplorable. India is burdened with many heavy charges which ought to be borne wholly or in part by the Imperial Exchequer of England; the public debt is rapidly increasing;* the resources of the country, so urgently needed for internal improvements, are misapplied; much useless and wasteful expenditure is kept up in India as well as in England; the people are loaded with excessive and odious taxes; India is impoverished by the heavy and increasing drain of its wealth to the governing country; the people are denied an honourable career by being shut out from all the higher offices in the public service of their country; and no adequate efforts are being made to rescue the mass of the people from a state of gross ignorance and abject poverty,† or to improve their wretched condition and increase the products and develop the resources of the country.‡ Matters have come to a crisis, necessitating the interference of your Honourable House, which your Petitioners now humbly invoke.

39. By making judicious retrenchments, practising rigid economy, relieving the Indian Treasury of many burdens unfairly imposed on it by the Imperial Exchequer, and adjusting the financial relations between India and England on an equitable footing, your Petitioners humbly submit there will be no deficits, all financial difficulties will disappear, the necessity of excessive taxation will be obviated, and ample funds will be available from the ordinary revenues of India for every legitimate purpose, whether Imperial or local, for developing the inexhaustible resources of the Indian empire, for diffusing the benefits of education, and ameliorating the condition and promoting the permanent welfare of 150,000,000 of Her Majesty's loyal subjects.

40. Your Petitioners are extremely gratified to learn that, on the motion of so distinguished a personage as the Right Honourable W. E. Gladstone, a Select Committee of your Honourable House has recently been appointed to inquire into the financial administration of India. Your Petitioners solicit your Honourable House to refer this Petition, and all the facts and representations therein set forth, to that Honourable Committee for investigation and report. Your Petitioners sincerely hope that the inquiry entrusted to the Select Committee will lead to beneficial results, and enable your Honourable House to relieve the people of India as much as possible from the present excessive burden of taxation, and provide adequate remedies for the evil of which your Petitioners and their fellow-subjects residing in different parts of India, now complain, place the financial administration of India on a sound and satisfactory footing, and adjust the financial relations between England and India on a just and equitable basis.

41. Your Petitioners submit that it is desirable to put the said Select Committee in possession of the views and sentiments of the intelligent portion of the native inhabitants of India. As such native witnesses are not available for examination in England, your Petitioners solicit your Honourable House to instruct the Select Committee to procure in India the views of the representatives of different classes of Her Majesty's Indian subjects, in regard to the important matters entrusted to the Committee for inquiry and report.

42. Your

* Since the year 1840 the public debt of British India has increased from 34,484,997 £. to 102,866,189 £, and the annual charge for interest thereon has risen from 1,595,778 £. to 5,052,014 £.

† Out of the large income of 51 millions, the amount devoted by the Government of India for the promotion of education this year was 606,200 £. for a population of 155,348,000, being at the rate of less than 1 d. per head. In the United Kingdom the amount spent by the State for primary education is 1,214,661 £. for a population of 30 millions, being at the rate of nearly 1 s. per head.

‡ The following statistics give a fair idea of the poverty of India compared with the capacity and means of Great Britain, her Colonies, and the United States of North America. Whilst Australia is able to consume 6 l. a head, and British North America 1 l. 5 s., India consumes only about 2 s. a head of British manufactures. The exports of the produce of the United Kingdom are nearly 6 l. 10 s. a head of the population, those of British North America about 3 l. a head, and of Australia about 11 l. (exclusive of gold); those of India are scarcely 5 s. a head.

Appendix, No. 1.

42. Your Petitioners, therefore, humbly pray that your Honourable House will be pleased—

(1.) To direct the Executive Government of India to reduce the public expenditure, totally to abolish the income-tax, reduce the recently enhanced salt-tax, and other imposts which press heavily on the people, and prohibit the imposition of fresh taxes for Imperial or local purposes;

(2.) To provide a permanently efficient check upon the increase of public expenditure and taxation in India;

(3.) To devise suitable measures for curtailing the overgrown and excessive expenditure of that department of the Indian Treasury which is under the immediate control of the India Office in England, and to provide an efficacious check against its increase, by prescribing definite limits for the principal charges, which should not be exceeded without obtaining the previous sanction of Parliament;

(4.) To relieve the Indian Treasury of charges which ought to be defrayed wholly, or in part, by the Imperial Exchequer; and

(5.) To grant an Imperial guarantee for the public debt of India, under such conditions as may be necessary to secure to the public the saving to be made thereby.

43. By adopting suitable measures for redressing the grievances of the people, and by thus removing the existing sources of dissatisfaction, your Honourable House will strengthen the attachment of 150,000,000 of British subjects to Her Majesty's Throne; and your Petitioners humbly trust they will not have appealed in vain to your Honourable House to do this act of justice to the people of India.

And your Petitioners, as in duty bound, will ever pray.

Bombay, 20 March 1871.

Appendix, No. 2.

PAPERS RELATING TO OPIUM.

Appendix, No. 2.

From *A. R. Young, Esq.*, Secretary to the Government of *Bengal*, to *W. Grey, Esq.*, Secretary to the Government of *India*, No. 1780, dated 14th July 1860.

I AM directed to acknowledge the receipt of Mr. Secretary Edmonstone's letters, No. 557, dated the 23rd November 1858, and No. 23, dated the 12th January 1859, forwarding communications from the agent to the Governor General in Central India, and from the Government in the North Western Provinces, in which a change of system is suggested in the mode of realising the revenue derived from opium in Bengal. The proposal is to substitute for the present Government monopoly of manufacture and sale, the free and unrestricted cultivation of the poppy, and the free manufacture and export of opium on payment of a fixed duty. On this proposal the opinions of the Lieutenant Governor and of the Board of Revenue are invited.

2. The Board's report, dated the 21st November last, No. 405, with its voluminous enclosures, is herewith forwarded; and the arguments on which the proposed change is based are so completely discussed in these papers, that little is left to the Lieutenant Governor to add on this subject. The conclusions to which the Lieutenant Governor has arrived are, that all the evils imputed to the opium monopoly, whether direct or indirect, and whether affecting of India, England, or China, are without exception imaginary; and that all the principles on which the system is attacked, are either demonstrably unsound, or of no practical importance, so far as this particular question is concerned. He is also of opinion that the monopoly works admirably in practice; he does not think it impossible that a very large revenue might be raised in India from opium, without resort to the device of a monopoly; but he cannot see how any real advantages, greater than those of the present system, are attainable under any other system. He sees in any change a risk of permanent loss of revenue, whilst he holds it to be certain that any sudden change would involve a great annual financial loss of indefinite duration; it follows that in his judgment it would be ruinous, in the present state of the Indian finances, to try organic experiments in this most prosperous department.

3. Sir R. Hamilton's objection to the Government monopoly in opium seems to rest entirely on the "opprobrium" to which it subjects the Government, and he considers that were "the system which obtains in Malwa introduced in Bengal, free and unrestricted growth and cultivation, being allowed anywhere and everywhere, an uniform duty on export might be levied without the revenue from this source being sacrificed or endangered." Mr. Muir, a member of the Board of Revenue in the North Western Provinces, who is the other advocate of the change of system, urges its adoption, likewise mainly with a view to "relieve the Government from the odium at present attaching to it, of not only encouraging the growth of the poppy, but of itself being the direct trafficker in the drug, and its monopolist"; and he also considers that the revenue would be sustained under a system of excise and export. He advances in support of his proposal the further considerations, that the suggested reform would get rid also of the "large and costly establishments maintained by Government for the complicated system of advances, &c." and that with the agency system would cease, "the harassing interference which it exercises throughout the country with the transactions of the peasantry," whereby "a sensible relief to the administration" would be afforded.

4. The objection founded on the imputation of immorality to which the Government is exposed under the present system, is of little weight; were the imputation true, this would be a fatal objection against which no financial arguments could stand; if the imputation could be supported on the foundation of fact with any show of reason, the objection would have weight; but there is neither truth nor show of truth in it; now, at all events, that the importation and cultivation of opium has been legalised by the Chinese Government, there remain no means of putting the imputation into a plausible form.

5. The Lieutenant Governor fully concurs with so much of the Board's remarks on this point, as go to show that the distinction, as a question of ethics, between raising a revenue from opium by an excise on consumption and a duty on exportation, and raising the same revenue by monopolising the manufacture, is fanciful and false, whatever the truth may be as to the effect, on the whole, of eating and smoking opium in India and China. No per-

Appendix, No. 2.

son, whatever may be his views on the total abstinence question, has attempted to draw a moral distinction between the *octroi* on wine and the monopoly price of Government tobacco, to both of which modes of taxation consumers in many continental towns are subject. But the Board seem to the Lieutenant-Governor to over-argue this point when they attempt to prove that the proposed system of free manufacture would be infinitely injurious and demoralising in comparison with the present system of monopoly. It is not at all necessary to the Board's conclusion that this argument should be established. It is not professed that "under the existing system the quantity of opium is checked and limited by Government," on any considerations of the injurious and demoralising effects of the use of opium; and to claim for this system any superiority on this ground would be to set up, and to set up unnecessarily, an unreal and unfair pretext. The same must be said of the plea in favour of the purity of the drug which is ensured by the present system, as compared with the perniciously adulterated article which it is assumed, contrary to experience in Malwa, would be produced under the proposed change of system. The truth is, that questions such as these do not properly belong to the subject. It is a fact as much beyond dispute that the Chinese are consumers of opium on a large scale, as that Europeans consume wine, spirits, and tobacco on a large scale. It is also an ascertained fact that supplies of opium can and will be obtained by the Chinese, whether the people and Government of India assist in furnishing those supplies or not. There is no doubt that if the growth of the poppy were to cease in India altogether, the Chinese would still be opium smokers, and would obtain from elsewhere, at home or abroad, what supplies of opium they required. This country, however, has a natural monopoly of good and cheap opium. If anyone seriously contends that this natural advantage, which Providence has granted to India, should be artificially counteracted by the prohibition of poppy cultivation in this country, out of regard for the Chinese, such an argument may safely be left to its fate. If things were left to their natural course, India would supply China with the greater part of the opium which Chinese consumption demands. It is the policy of the Indian Government to let things run as nearly as possible in their natural course, whilst it gives the public exchequer the benefit of the natural monopoly in question, thereby avoiding the necessity of equivalent taxation in some more inconvenient form. In doing this, the only duty of the Indian Government is to decide what method is most expedient and most for the advantage of this country. To this point the question narrows itself; and a candid decision in favour of the present system as compared with that proposed, will not be assisted by dragging into the discussion fancied advantages to the foreign consumer, which in reality do not at all enter into the motives by which the fiscal arrangements of India are regulated.

6. The Lieutenant Governor also finds it necessary to express his dissent from all that part of the argument of the Board's letter which assumes that the cultivators would cease to grow the poppy under a system of free manufacture, or that they would continue the cultivation only under the pressure of some such unpopular system as the indigo system has grown into in some districts. There is no more reason against the free cultivation of the poppy than there is against the free cultivation of the sugar cane, so far as cultivators and zemindars are concerned.

7. To notice next the assumption on which both Sir R. Hamilton and Mr. Muir proceed, that there would be no risk of loss of revenue from the introduction of the export and excise duty system, I am to observe that it appears to the Lieutenant Governor that the very material difference in the position of the poppy growing districts on this side of India and those of Malwa, with reference to the sea-board, appears to have been lost sight of by all who have taken part in this discussion. The Lieutenant Governor believes that no opium from Malwa can reach any place from which it can be exported by sea, except by routes passing over ghats, in which the traffic can easily be watched and checked, or by such circuitous routes as would swallow up all the profits of a contraband trade. In Bengal, on the contrary, it would be almost impossible to establish a really effective cordon, which would prevent the smuggling of opium to the sea-coast, down every water channel, and along every road, if, as Sir R. Hamilton proposed, poppy were allowed to be grown and opium to be manufactured "everywhere and anywhere." To avoid evasion of duty to an enormous extent, the only method open in Bengal, besides that of a monopoly and that of a limited and regulated manufacture, having little more resemblance to a true system of free cultivation and manufacture than the monopoly itself has, is to tax the poppy field.

8. On the score of expense, the Lieutenant Governor can see no limit to the cost of a really efficient preventive establishment; and the levy of the tax upon the land would be also exceedingly costly. A mere cordon enclosing any given tract of country would not be sufficient; but in every district establishments would have to be formed to prevent the illicit cultivation of poppy and retail sale of opium, and it cannot be doubted, as the Board remark, that such establishments, composed as they must be of native officials, would exercise a really "harassing interference" with the people.

9. That no such "harassing interference" is exercised under the present system, is established not only on the evidence of the local officers, whose testimony might in such a matter be received with hesitation, but on that of numerous landholders in the districts in which the agency operations are carried on, whose opinions have been collected by the agent of Behar. The highly respectable English planters of those districts, who have also been consulted by that officer, while they very naturally evince a desire to share the advantages of the trade in opium, and consider it desirable that it should be thrown open to all, have

nothing

nothing to urge against the present system as one involving any degree of hardship to the cultivator. It is, on the contrary, fully admitted by all who are acquainted with that part of the country, including Mr. Reade, Mr. Muir's eminent colleague in the North Western Provinces Board, that no cultivation is in so much favour with the ryots as that of the poppy for the Government agencies; and that in every point of view it is most beneficial to all engaged in it, or interested in the prosperity of the villages into which it is introduced. The engagements to cultivate being entirely voluntary, and terminable at option of the cultivators, cannot in any way be oppressive; and that the engagements are voluntary and terminable in practice, is proved by the enormous extent of what was poppy land, converted to other purposes within the last few years of general high prices. There is no doubt from the absence of any difficulty in the adjustment of balances, that poppy cultivation wherever it is continued, is remunerative. As soon as it ceases to be so, and in consequence other crops are sown in poppy lands, it is the policy and practice of the department to raise the price of the raw produce, as far as may be necessary to induce an increase of cultivation up to the desired limit. As far, therefore, as the cultivator is concerned, no system can be more free or more natural. Advances are made without interest, and under the personal superintendence of European assistants. All complaints are patiently listened to, and no coercion or interference whatever is exercised by subordinates in any stage of the production of the drug. Liberal allowance is made for loss of crops caused by storms or other calamities, and at the close of every season the amount due to the ryot is promptly paid up in full. Under such a system as this it is impossible that the ryots should be otherwise than thriving and contented; and that they thoroughly themselves appreciate the advantage of their position as opium cultivators is strongly illustrated by the incident adverted to in the Board's 12th paragraph, of their having adhered faithfully during the mutinies to their engagements even in the most disturbed districts, and having brought in their opium, often at much personal risk, in order to settle their accounts and to retain their position in the department.

10. In conclusion, the Lieutenant Governor desires strongly to deprecate, at the present time, any fundamental change in the system which now obtains in the opium department of the Bengal Presidency.

From the Honourable *A. Eden*, Officiating Junior Secretary to the Board of Revenue, to the Officiating Secretary to the Government of *Bengal*, No. 405, dated the 21st November 1859.

1. I AM directed by the Board of Revenue to acknowledge the receipt of your predecessor's letters, Nos. 2641, dated 2nd December 1858; 183, dated 22nd January 1859; and 532, dated 7th March 1859, with their enclosures.

2. The Board desire me to express their regret at the delay that has occurred in submitting the reports called for, but the question of the Government connection with the manufacture of opium is one of such vast importance, and the existing system has been attacked from time to time with so much prejudice and ignorance, that the Board were anxious to receive, and fully consider, the opinions of their subordinates before submitting their reply. In now forwarding the reports* of the opium agents and sub-deputy agents, together with their enclosures, I am directed to state that the Board most strongly deprecate any change of system, the result of which they are satisfied will inevitably be a temporary, and in all probability a permanent, loss of the extensive revenue now derived from this source.

3. The present system of raising revenue from opium has been most truly described by his Excellency the Governor General as a scheme showing so much integrity and soundness of policy as a means of finance, that it will be found difficult to devise any other scheme possessed of so many advantages, and so few real disadvantages; and yet the Government is now called upon, at a period of unexampled financial pressure and difficulty, and immediately after the suppression of a formidable mutiny and rebellion, to abandon that system, and to substitute another by which more than three millions sterling of the revenue will be imperilled; and this great risk is to be undertaken to satisfy the scruples of a few very enthusiastic and doubtless excellent persons, who, knowing but little of that against which they declaim, are pleased to consider and represent the manufacture and sale of opium by Government agency to be an opprobrium to the British Government and a heinous offence against morality. It will not be very difficult, the Board think, to show that the scheme now proposed will be infinitely more injurious and demoralising than the present one. The advocates of the former apparently see nothing wrong in raising revenue from opium by means of an excise and export duty, but they hold it to be a national sin to obtain revenue by the cultivation of the poppy and the manufacture of opium by Government agency, a nice distinction which the Board are unable to comprehend.

4. Under the existing system the quantity of opium is in some degree checked and limited by Government; under the one proposed there can be neither restriction nor limitation, and the drug which in its pure state is not pernicious if not used to excess, will be rendered so by adulteration with all sorts of deleterious ingredients.

* From Opium Agent of Behar, No. 49, dated 14th April 1859, with ten enclosures.

From Opium Agent of Benares, No. 40, dated 20th April 1859, with one enclosure.

Appendix, No. 2.

5. The present discussion arose originally with reference to the system which previous to 1856 obtained in the North Western Provinces, of farming the duties on the retail sale of opium for internal consumption; the expediency of admitting foreign opium into those provinces by passes; and the lowering of the retail price of Akkarree opium. The question, however, into which these discussions have now resolved themselves, is nothing less than the expediency of giving up the opium monopoly, a measure strongly advocated by Sir R. Hamilton, Agent to the Governor General in Central India, and Mr. Muir, Junior Member of the Revenue Board of the North Western Provinces, who would apparently substitute for the present system of manufacture and sale by means of Government agency, the free and unrestricted cultivation of the poppy throughout India on the payment of an acreage tax, and the free manufacture and export of opium on the payment of a fixed duty of 400 rupees per chest.

6. The Board desire me to point out that the whole of Sir R. Hamilton's arguments in favour of this plan are founded upon the very fallacious supposition that "if the Chinese consider opium smoking a necessity or a luxury, they will purchase the drug, for they cannot grow it." Now, from the reports of Her Majesty's consuls forwarded to this office, with Mr. Secretary Halliday's letter, No. 47, dated 18th January 1849, it was apparent that in the Southern Provinces of China, and especially in Yunnan Kwangsee, Ninghae, and Keangsee-Che-Kuang, there was a very considerable and increasing indigenous cultivation of the poppy as long ago as 1848; and there are very strong grounds for the belief that this cultivation has been extended to a very great amount since that period. The withdrawal of the prohibition of the Chinese Government, the increase of duty on the Malwa drug, and the late high prices obtained at the Calcutta sales, are events any one of which is sufficient in itself to give a very strong impulse to the poppy cultivation in China.

7. The Board are informed from more than one reliable source that there are this year 20,000 chests of the indigenous drug in the China market, a specimen of which has been forwarded to them, and is now under analysis.

8. With therefore an increase of production in China it is not to be expected that the Chinese will continue to take that produced in India after they have ceased from any cause to prefer it to the indigenous drug, and there is but little room to doubt that this preference will cease as soon as the Government retires from the manufacture of opium, and leaves its cultivation and preparation to the chance care of unskilled speculators, and the risk of adulteration by competing and short-sighted manufacturers.

9. The high price which the Bengal opium has hitherto commanded in the China market arises principally from the confidence which exists there as to its purity from adulteration, and the skill, experience and science of those by whom it is prepared. The slightest change even in the external appearance of the chests in which the opium is contained, has been found to create suspicion in the minds of the brokers, and to affect the sale. Opium, therefore, prepared under a system of free and competing manufacture, could not be expected to command anything approaching the prices of the Government provision opium. The large shippers in Calcutta would never then be able to purchase, as they now do, without examination or even inspection, large quantities of the drug, in full reliance on the good faith of the agency through which it comes to the market. And the able report of Dr. Impey, forwarded to the Board in Mr. Under Secretary Beadon's letter, No. 954, of the 15th April 1846, thus describes the distinction made by the Chinese between opium prepared under a system of free cultivation and that prepared at the Government agencies. Speaking of the Malwa opium, he remarks: "In China, at the present time, the frequent adulterations have given rise to so much mutual suspicion and mistrust, that a supercargo from each opium vessel is generally in attendance while the Chinese boil and make the extract, so little is confidence acknowledged on either side." There could scarcely be a more scathing aspersion than this upon the character of the examination to which opium is subjected in Bombay, and the value that is set upon British acumen and disinterestedness *per contra*, may be quoted the following passage from Martin's British Colonies: "It may be here observed that a chest or ball of the East India Company's opium is instantly purchased by a Chinese customer, without any other examination than that of the Company's mark."

10. There are, therefore, sound reasons for doubting whether opium manufactured by private parties in Bengal would be able to compete with the indigenous drug of China, an analysis of which, in 1853, proved it even then to be a very formidable rival to the Bengal produce; it is perhaps, even now, rather a caprice than any real superiority that makes the Benares and Patna opium such a favourite with the more wealthy consumers in China; it is, at all events, a matter of certainty that as soon as the confidence in its purity begins to be shaken, it will be a mere question with the Chinese whether they will import their rice and grow their opium, or import their opium and grow their rice. With their very dense population, it is not possible that they can grow both sufficiently to meet the demand, and so long as the Bengal opium continues to enjoy its present *prestige*, and is obtainable at a moderate price, they will, in all probability, to a great extent at least, prefer the latter course.

11. The Board observe that one of Mr. Muir's principal objections to the present opium agency system is the "harassing interference which it exercises throughout the country with

with the transactions of the peasantry"; but his colleague, Mr. Reade, a most distinguished officer, having more than 20 years' experience in the opium producing districts of the North Western Provinces, has satisfactorily disposed of that erroneous statement; it is also thoroughly refuted by the impartial testimony of several respectable and experienced European indigo planters, gentlemen who cannot be accused, generally, of viewing the proceedings of the Government with a very indulgent eye.

12. The opium Assamees, however, have themselves given the most conclusive contradiction to this unjustifiable charge of oppression; they were everywhere faithful to their engagements, and loyal in their conduct throughout the whole of the late season of disturbance and disorganisation; when all other classes were unsettled and excited they peacefully continued their cultivation and regular occupation, and brought in their produce as usual to the Government factories, notwithstanding that their districts were overrun with rebels and mutinous soldiery, many of whom were bound to them by the ties of kindred; and not only this, but, for better security, the Ghazepore cultivators left very large sums in deposit in the Agency. Had the abolition of the Government manufacture of opium been "a sensible relief" to the peasantry, is it not natural to suppose that they would have hastened to take advantage of these lawless times to knock off the fetters of the Opium Department? But, so far from doing this, they set a striking and useful example of loyalty and good-will towards the British Government. If it were necessary to adduce further proof of the inaccuracy of these charges against the Department, the Board would allude to the measures which it has twice been necessary to adopt of late years to prevent the extension of the cultivation, which, from its great popularity with the agricultural classes, threatened to exceed the limits within which the then Government thought it desirable to circumscribe the production of the drug.

13. When the Governor General's agent for Central India has framed this very important scheme, without taking into consideration the large amount of indigenous opium produced in China; and when the junior member of the Sudder Board of Revenue, North Western Provinces, is so misinformed as to make allegations which have no foundation against the Opium Department, the Board submit that it is incumbent on the Government to pause and consider well before consenting to adopt and carry out a proposal which is based apparently on such very imperfect and superficial information, and which involves the abolition, at a very great risk, of a system which has worked well for so many years, and has yielded a princely revenue without any difficulty, discontent, or oppression.

14. The proposal to abolish the monopoly and substitute an export duty on opium raised under a system of free production, at first seems plausible; but the Board trust to be able to show that such a change can only be attended with the worst effects, whether viewed in a merely financial or in a moral point of view.

15. The condition of the China market and the peculiar circumstances which affect the price of opium are such as to make it impossible to fix any specific rate for the duty, which could be considered to secure equally to the Government and to the exporter a fair share of the profits of the trade. The fluctuating nature of the price of opium is apparent from the fact, that in 1853-54 the average price obtained at the opium sales was Rs. 740. 5. 5½, whereas throughout the present year it has been fetching considerably over 1,600 rupees per chest. From the Appendix C. of the Behar Agent's Report, it will be seen that the average cost price to Government, of a chest of opium in the year 1887-88, was Rs. 286. 9. 5½, and that the average sale proceeds of that year's provision were Rs. 538. 12. 10. If in that year, then, the Government had levied a mere export duty of 400 rupees per chest, the revenue of the State would have gained to the extent of Rs. 147. 12. 7½ per chest in excess of the actual profits obtained under the existing system, and the manufacturer, under Sir R. Hamilton's plan, would have been a loser to the same extent. But if the year 1856-57 is taken, it will be found that the cost price of each chest was, on an average, Rs. 269. 6. 1., and the selling price Rs. 1,436. 4. 7½; and if in that year, instead of receiving the full advantage of the high market prices, the Government had merely been able to levy a duty of 400 rupees, the State would have lost Rs. 766. 8. 6½ on each chest, which 22,016 chests would have been a loss of revenue amounting to 1,68,76,000 rupees on the Behar opium trade.

16. In adjusting the duty, it would only be possible to fix it at the *minimum* rate of monopoly profit, otherwise in a bad season the whole of those engaged in the manufacture would be ruined, and the opium manufacture at once abandoned, for, as shown in paragraph 4, the Chinese are no longer solely dependent upon India for their supply, and there would not therefore be a possibility of shifting the whole duty upon the consumer. If, then, the minimum rate of profit was to determine the amount of duty which the Government should levy, the difference between that and the maximum would become the certain profit of the exporters, to the very great detriment of the interests of Government.

17. Another most important objection to the proposed scheme, in the opinion of the Board, is that, if the present average opium revenue is to be maintained under the change of system (which no one seems to question), this can only be done by increasing very largely the production of opium. If even a fixed export duty of 500 rupees per chest can be permanently imposed, which the Board consider extremely doubtful, the cultivation must in all possibility be more than doubled to yield the same amount of revenue as is now realised with so much punctuality, facility, and satisfaction to all parties.

18. Had a fixed export duty of 500 rupees per chest been in operation in the years 1856, 1857, and 1858, instead of the present system, the very large additional number of chests

Appendix, No. 2.

shown in the following memorandum, would have been required to produce the net revenue realised in those years.

YEARS.	Net Opium Revenue.	Number of Chests sold.	Number of Chests required to make up Revenue of Column 2 taking Duty at 500 per Chest.	Increase required.
	<i>Rs.</i>			
1856 - - -	2,71,37,210	41,402	64,274	12,782
1857 - - -	3,51,54,460	43,902	70,308	26,406
1858 - - -	3,77,44,003	32,686	75,489	42,803
	10,00,36,073	1,18,080	2,00,071	81,991

19. The Board doubt, whether, competing as we should have to do with smugglers, an export duty of 500 rupees could be maintained, and think that 300 rupees will be found to be the maximum duty that could be imposed; should this be the case, if the opium revenue is not to suffer very seriously, the cultivation and consumption of the drug must be increased to an enormous extent.

20. If this increase of production and demand could not be secured, the proposed system would fail most completely as a measure of finance; whereas, if they could be secured, it would utterly fail as a measure of morality, for in the year 1858 we should have had to find an increase of consumers capable of taking 42,803 chests, or, in round numbers, taking the average consumption of one man to be one mace per diem, which is generally admitted to be a fair average, we should have required 1,088,251 consumers in excess of those who are now purchasers of the drug.

21. If, indeed, the use of this drug be as bad and demoralising as it is represented by those who so zealously denounce the connection of Government therewith, the proposed plan will increase the evil many fold, and so far from the Government being relieved thereby from "the odium at present attaching to it of encouraging the growth of opium," it is very palpable that if the measure succeeds the growth of opium will be very much encouraged, and the Chinese markets glutted with the drug, which will also be introduced into every hole and corner of India.

22. The Governor General's Agent apparently considers the large increase of opium produced under the Mulwa system a matter for gratulation; but the Board cannot help thinking that if an equal amount of revenue could have been obtained from half the quantity of opium exported the financial skill would have been more apparent, and the result less injurious. Admitting the drug to be as noxious as Sir R. Hamilton and Mr. Muir believe it to be, the Board fail to see why a system should be adopted which involves the production and dissemination of more of it than is necessary, and which will increase opium eaters and smokers by decreasing its price. It is true that the use and abuse of opium cannot be stopped, but they can be, and have, under the present system been to a great degree controlled and restricted. This, however, would be impossible under a system of free manufacture and cultivation.

23. The Board further desire me to point out that a certain consequence of the abolition of the monopoly will be the sacrifice of almost the whole of the Abkaree opium revenue, which, in the lower provinces alone has increased from 2,44,798 rupees in 1847-48, to 6,64,669 rupees in 1857-58; and that it will at the same time deprive the Government of all power of checking the local consumption of the drug.

24. The poppy plant can be grown to a certain extent in almost every district in Bengal. It is supposed by persons who are competent judges of such matters, that lands which produce tobacco will yield a fair average poppy crop. If this is the case, when the prohibition of the cultivation of the poppy is withdrawn, it will be grown in small patches for local consumption in almost every village and hamlet in Bengal; and even those who have hitherto abstained from its use will be tempted by its cheapness to have recourse to the stimulant. What the effect of such widely spread cultivation of the poppy would be it is not difficult to foresee.

25. The Board cannot comprehend how any persons should be found to propose the withdrawal of the only check that we have on the consumption of this so-called deleterious article, and thus to expose our own subjects to those great evils which are so much deplored by them in the case of the Chinese. Surely, the Board observe, our own subjects are at least entitled to the same consideration as the people of China; why then, for the sake of removing an imaginary stigma which is supposed by misinformed persons to attach to the opium monopoly are we to expose the whole population of India to the evil of an unrestricted supply of this so-called noxious drug? The use of opium has been carried to such an extent in China that nothing that the Indian Government can do will check it; if they did not get their supply from this country they would from other countries, and failing this would grow it at home, and appropriate for the cultivation of the poppy the land which is now employed in producing wholesome food and all the prime necessities of life. This is not the case with Bengal; the Abkaree system has hitherto acted as a strong check upon the excessive use of the drug, and the Board can scarcely conceive any measure more mischievous in the eyes

eyes of those who deprecate the Government connection with the growth of the poppy than the withdrawal of this check in these provinces. Appendix, No. 2.

26. It is true that Mr. Muir says that he would still maintain an excise duty on the retail sale of opium, and would also impose a tax of 5 rupees per acre on land cultivated with the poppy. But it is unnecessary to point out that the Abkaree opium revenue in the opium producing districts is merely nominal, and there is no reason to suppose that it would or could under any circumstances be otherwise, if the cultivation was more extended. The Board further doubt very much whether the proposed acre tax would be found to answer at all. An acre rate, fixed and levied through the agency of native officials, would be certain to result in "harassing interference" with, and oppression of the people; and it seems to be the opinion of many well-informed persons, official and non-official, that the "Keories," who are the best cultivators of the poppy, would throw up the cultivation rather than pay this acre tax.

27. There are, moreover, other practical difficulties in the way of the proposed scheme which, if even no other objections existed, would be deserving of the most attentive consideration.

28. Subsequent to the abolition of the manufacture and sale of opium by Government agency, and previous to the thorough organisation and establishment of any other system, there must necessarily be an intermediate period of three or four years, during which there would certainly be a very large decrease in the manufacture of opium, and in the revenue derived therefrom. The Board think that the revenue may be expected to suffer during that period to the extent of at least a million and a half sterling.

29. When the Government shall be pleased to give notice of the intended withdrawal from the manufacture and sale of opium, the quantity of Malwa opium will probably for a time at least, increase to a considerable extent, and some portion of the advantages hitherto enjoyed by the peasantry of our own provinces, will be transferred to the subjects of Holkar; but the Board see reason to apprehend that the poppy cultivation in Behar and the North Western districts will be permanently diminished, for immediately Government ceases to make advances, a very large portion of the hereditary cultivators will abandon the cultivation of the poppy plant, and take to other equally remunerative crops. When a native has once forsaken his old hereditary trade or occupation, it is well known how difficult it is to induce him to return to his former employment, and in this the poppy cultivators of Behar and the North Western Provinces will be found very much the same as the generality of their countrymen; and after the cultivation of the poppy has once been abandoned, it will be most difficult to re-establish it. And even supposing that an increase of the poppy cultivation in Malwa does result from the withdrawal of Government from the manufacture, the Board feel confident that this increase would not to any sensible extent cover the decrease in Behar and the North Western Provinces.

30. Even if European and native capitalists and speculators are prepared at the proper time to enter the field abandoned by the Government, and to offer to the cultivators advances on the same terms as those on which they are now given by the Government agency, it is, the Board think, very doubtful whether any large portion of the professional cultivators would continue the poppy cultivation. The people know well by experience the great difference that exists between advances made by Government and advances made by private parties, European or native, and the Board see no reason for supposing that opium cultivation under a change of system would be in any degree more popular than indigo cultivation now is; and his Honor is well aware of the frequency of the complaints made by planters of the reluctance of the cultivators to grow indigo for them under advances. At the same time it is very certain that the manufacture of opium could never be carried on, on a large scale, except under a system of advances, and that no private person would be willing to make advances to the requisite extent unless they receive some special legal protection against defaulting cultivators, but the Board are clearly of opinion that if private speculators are armed with any special legal powers, the poppy cultivation will be most grievously oppressed, and discontent and disaffection to the Government widely spread among the peasantry wherever these specially protected manufacturers carry on their business; further, the Board apprehend that if such powers were conferred upon the opium manufacturers, those engaged in the cultivation and manufacture of other products will have a right to demand to be invested with similar authority, and they cannot think that the proposers of the change are prepared to recommend this.

31. I am further to request that it may be borne in mind that any alteration in the existing system will have an injurious effect on the land revenue of the poppy-producing districts. The zemindars and tenantry of these districts depend much upon the opium advances for the payment of their revenue and rents, and much inconvenience and distress must result from the stoppage of this accommodation which they have relied on for so many years, and which has been every way so advantageous to them.

32. In conclusion, I am to observe that the chief advantages of the existing system are that the Government realises every year without difficulty about 3,000,000 sterling of net revenue from foreigners; that large sums of money are expended amongst the people of the opium-producing districts, thus lightening the land tax, and making the cultivation popular amongst the people of those districts.

33. These and other collateral advantages should, it appears to the Board, be carefully weighed before any alteration is made in the present popular and profitable system. The importation of opium into the Chinese Empire has been legalised by the Chinese authorities, and therefore the Indian Government is now no longer obnoxious to the reproach of

Appendix, No. 2.

manufacturing an article much of which found its way through the hands of third parties into a country into which its introduction was prohibited; this was formerly the most substantial imputation against the Opium Department, but it exists no longer. There is no moral delinquency in the mere cultivation of the poppy plant. If the immoderate consumption of opium could be effectually prevented, the Board believe that it would be well, as in the case of alcoholic liquors; but as this is not possible, and as the use of opium in China and elsewhere would not in all probability be decreased in the smallest degree by the cessation of the export of the drug from this country, it seems to them to be most imprudent and impolitic, more especially at the present time, to throw away or even risk in any manner so large a revenue merely for the sake of silencing a clamour which proceeds for the most part from a misconception of the truth. At all events the Board deprecate a change which will substitute for the present system one which will infinitely aggravate all existing evils; which would be injurious to the interests of a laborious, loyal, and well affected section of the people; which would, according to the proposers' own views, tend to demoralise the population of Lower Bengal, and would in all probability occasion a very large deficit in the public revenue.

34. The Board would earnestly recommend that, for the present at least, there should be no interference with the existing opium arrangements; but if, notwithstanding all these objections, which, however, the Board consider conclusive, it be determined at any time to try the Malwa plan, the change should be carried out gradually and with great circumspection. They think that three or four years' notice at least should be given, and tenders invited at the end of that period for the purchase of the Government factories and premises. This would afford time to capitalists or joint-stock companies to arrange for the provision of funds, occupation of lands, mode of payment to a producer, means of manufacture, and necessary legislation. A gradual yearly reduction is, in the opinion of the Board, impossible, as private capitalists could not enter the field in competition with Government until the Government provision had reached its lowest limit, and in the meantime the revenue would completely fall, and cultivators give up the production of the plant. Before any other steps are taken, an experimental introduction of free cultivation on a small scale in some of the opium-producing districts of the North Western Provinces might be attempted, as suggested by the junior member, Sudder Revenue Board, North Western Provinces.

P. S.—The return of the enclosures (13 in number) is requested, when no longer required.

Appendix, No. 3.

ABSTRACT of the **PROCEEDINGS** of the Council of the Governor General of India, assembled for the purpose of making Laws and Regulations under the provisions of the Act of Parliament, 24 & 25 Vict. c. 67. Appendix, No. 3.

The Council met at Government House on Saturday, the 6th March 1869.

PRESENT :

His Excellency the Viceroy and Governor General of India, K.P., G.C.S.I., presiding.

His Honour the Lieutenant Governor of Bengal.

His Excellency the Commander in Chief, G.C.S.I., K.C.B.

The Honourable G. Noble Taylor.

Major General the Honourable Sir H. M. Durand, C.B., K.C.S.I.

The Honourable H. Sumner Maine.

The Honourable John Strachey.

The Honourable Sir Richard Temple, K.C.S.I.

The Honourable F. R. Cockerel.

The Honourable Rājā Shiorāj Singh, C.S.I.

The Honourable Mahārājā Sir Dig-Bijay Singh, Bahādur, K.C.S.I., of Bahāmpūr.

The Honourable G. S. Forbes.

The Honourable D. Cowie.

The Honourable M. J. Shaw Stewart.

The Honourable J. N. Bullen.

INCOME TAX BILL.

THE Honourable Sir *Richard Temple* in moving for leave to introduce a Bill for imposing duties on income and profits arising from offices, property, professions, and trades, said—

I have now to submit to your Excellency and to the Legislative Council the Financial Budget of British India for the official year 1869-70. This will be the tenth annual Statement presented since the creation, in 1859, of the office which I have the honour to hold.

Following the practice of my predecessors, I shall divide my exposition into three parts, namely, the "actuals" of 1867-68; the "regular estimate" of 1868-69; the "budget estimate" for 1869-70. Slightly veiled under these technical designations, my meaning is just this: I shall exhibit the finances, firstly, as they have really turned out for the year that is past; secondly, as they are almost certainly turning out for the year that is present; thirdly, as they are expected to turn out for the year that is to come.

The first part of my subject, then, relates to the finances of the past year 1867-68. My Right Honourable predecessor, Mr. Massey, showed in his last statement that the receipts had risen from 46½ millions sterling in the budget estimate to 48½ millions in the regular estimate. In the statement of actuals which I have now to produce, these 48½ millions have risen further to a little less than 48½ millions. In other words, the income of that year has turned out actually 1½ million more than what was originally estimated. This is so far very satisfactory.

On the other hand, the general and ordinary expenditure of that year has actually turned out to be nearly 49½ millions, being 2 millions more than the budget estimate of 47½ millions. Of this increase half a million arose in India, and the remainder occurred in England.

Thus it is that although the receipts of that year rose much more than was anticipated, the expenditure rose even more. And the result shows 49½ millions of expenditure to only 48½ millions of receipts, or an actual deficit of more than a million.

Appendix, No. 3.

But the statement of general and ordinary expenditure, as I have just given it, will be found to differ from that presented by my predecessor. It will be remembered by this Council that last year he explained the distinction which had been introduced between ordinary and extraordinary expenditure. In the extraordinary expenditure he proposed to include not only the great irrigation works and the special works at Bombay, but also a part of the expense of military barracks, of roads, and other public works. After further consideration it has been decided, with the express approval of the Secretary of State, that only such works as those for irrigation or for the special land funds at Bombay shall be counted as extraordinary; and that all other public works, including military barracks, communications, and the like, shall be treated as ordinary. The principle of the distinction is clear. All public works, however beneficial indirectly, are to be provided for from the ordinary income of the year; and those works only are to be treated as extraordinary and provided for by loan which will yield a direct cash return to the Treasury. In order to meet this view, the original budget estimate and the statement of actuals have been slightly re-arranged. And the consequence is the exhibition of a deficit as already set forth.

Besides the ordinary expenditure thus revised, there was also an expenditure of more than half a million on extraordinary works, according to the improved definition. This added to the 49½ millions already shown brings up the total to more than 50 millions.

Thus the financial out-turn of the last year, 1867-68, has been a deficit of a million, including all ordinary expenditure, or a deficit of more than a million and a half, including extraordinary expenditure.

This result, running counter to some arguments heretofore used, does no doubt read us a lesson; especially as it follows on the heavy deficit of 2½ millions left by the preceding year, 1866-67.

So much, then, for the finance of the last year, 1867-68, as now proved by the event. And before quitting the region of actual event, I would observe that in respect to the revenues and resources of India, experience shows that the estimates, in the aggregate, however favourable, are almost always outstripped by the reality. Just as wave passes wave in a rising tide, so one budget after another springs up in an ascending scale. Then although each budget estimate has surpassed its predecessor, it in its turn has been usually surpassed by the regular estimate as the year advances, which, again, has been generally surpassed by the statement of actuals after the year has closed. Such experience does indeed inspire hope.

But then unfortunately the same process happens with the expenditure, and the consequence has been that of the eight years that elapsed from the commencement of our budget system in 1860 up to the end of last year, three only were years of surplus, while five were years of deficit. In one year, however (1861-62), the deficit was but small, so it may be said that half the period, or four years, have been remarkable for surplus or equilibrium; while deficit has been characteristic of the remaining half.

All these deficits occurred notwithstanding that within this brief period, that is, since 1859-60, our income grew from 39 millions to 48½, showing increase of 10 millions, or more than 20 per cent.; which increase has accrued not by territorial accession involving counter expenses, but by regular development; and notwithstanding that there has been no considerable war, and that general peace has prevailed. Nor can these deficits be attributed to expansion of military and defensive establishments, for, on the contrary, the military and main charges (incurred either in England for India, or in India itself) have fallen by full 50 per cent. The real growth of expenditure, then, has been on account of general administration or of public improvement. This fact is, on the one hand, satisfactory, as showing that the expenditure has been directly for the advancement of the people of India, the money having been spent on the country itself. On the other hand, it affords a warning that such increase being not absolutely unavoidable (however beneficial) must either be sternly kept down, or else, if it be maintained in the just interest of the country, then that some augmentation of our resources must be secured.

Again, although the retrospect of increase upon any given period, like a decade of years, is gratifying, yet the gratification would be abated if the increase were to be strictly analysed. For, on the whole, the land revenue within the period has not materially increased; doubtless the settlements, permanent or for long periods, prevent such increase, but then re-settlements in several parts of India have been made on expiry of old settlements, and yet for the country at large the net result has been to keep the total much as it was. The customs have not increased; there is nothing wonderful in that, inasmuch as the duties have been so largely reduced. No doubt the salt revenue has much risen; but then the duties have been greatly raised in some provinces. So also the opium revenue has risen; but the causes of that progress are extraneous to India. On the whole, nearly half of the 10 millions of increase has sprung from the two items of salt and opium. The rest has arisen from several sources, among which must be included assessed taxes. Thus our progress, though on the whole considerable, is yet not such as would indicate any rapid development of those national resources on which the State can rely. This progress, therefore, is not at all such as should inflate us with undue confidence or lull to sleep our financial vigilance to maintain the equipoise of income and expenditure.

Sir Charles Trevelyan, speaking in 1863, expressed a fervent hope, not yet realised, that the deficit of 1861-62 would prove to be "the last of the long series of Indian deficits."

My predecessor, Mr. Laing, addressing this Council in 1861, spoke with a just horror of a chronic

a chronic deficit in time of peace. Mr. Laing graphically described such a deficit as a "huge bully, with whom weary rounds must be fought, who must never be allowed to claim a cross or a drawn battle, but who must be gone into and finished." Again, he likened such a deficit to "an Indian tiger into whose carcase a parting shot must be fired." Lastly, he said that if deficit could then be only "extinguished," the Chancellor of the Exchequer might "renounce his taxing art, and like Prospero bury his magic wand fathoms deep." And surely enough he did succeed in drowning deficit for a time. For that year there was a deficit so slight as to be inappreciable. For the two following years there was a surplus. For the next year, too, there was but a small deficit. But now for two years past the deficits have reappeared. And for the current year I shall have to tell the old tale of deficit. Thus, alas! deficit, though scotched, was not killed after all. But the "bully" of Mr. Laing's time is in these days up in arms again; the "tiger" has come back to life; the smouldering flame not finally "extinguished" has burst out again in our finances.

I now come to the second part of my subject, the current year nearly expired, 1868-69.

The budget estimate for this year presented by Mr. Massey showed the receipts at 48½ millions. But as the year has advanced, and as the known figures of eight months out of the twelve have enabled us to correct the budget estimate, we have been obliged to bring up the anticipated amount to 49½ millions, showing a satisfactory augmentation of three-quarters of a million. The increase distributes itself in a normal and natural manner over the many branches of our income.

The only items which I shall select for notice are customs and opium.

In round numbers the budget showed 2½ millions for customs; the regular estimate shows 2¼ millions, or an increase of a quarter of a million, which is very satisfactory so far as it may indicate the progress of trade. The budget estimate for 1868-69 was taken at 2½ millions, being in excess of the preceding budget (2¼ millions), notwithstanding that during the year there had been numerous remissions of petty duties, some 40 articles having been removed from the list of dutiable imports, and 88 articles from the list of dutiable exports. Still the budget estimate rose, just confidence being felt in the elasticity of the trade. But this rising budget has, as we have just seen, been outdone by the probable results, the estimate of 2½ being brought up to 2¾ millions. The increase is almost equally distributed among our principal ports, Calcutta, Bombay, Madras, and Rangoon; and also between the two headings of imports and exports. There is increase in the fiscal yield of such imports as silks, as metals, as stores and materials. The importation of English piece goods has been well sustained: but unfortunately the drought and distress, in northern India affecting many classes of natives who are customers for our English fabrics, has caused many markets in the interior of the country to be slack and dull.

While on the subject of customs, I shall note that we have recently issued for the first time a volume of the statistics of the foreign trade and navigation for British India, prepared after the model afforded by the Board of Trade in London. Whatever may be said as to the deficiency of current statistics in India, such remarks will no longer apply to the returns of our foreign trade. Now, what does this volume show? Why, that the total foreign trade (merchandise and treasure) amounted to 101 millions in value in 1867-68, against 95 millions in the preceding year, showing an increase of 6 millions, or 6 per cent. Just nine years ago, in 1860, Mr. Wilson, when describing the financial dangers of that era, mentioned as a pillar of strength the fact that in three decades of years (that is, 30 years) the trade had sprung from 14 millions sterling in value to 60 millions. Since then another decade has passed away, the 60 millions total has risen to more than 100 millions, and the trade is still rising fast. Again, in Mr. Wilson's time, the Customs revenue was just under 2¼ millions. It is a little over that now: and this notwithstanding that the duties have been reduced from 20 and 10 per cent. to 7½ and 5 per cent., and that full 130 articles have been wiped out from the list of dutiable merchandise at the Customs House. Although only one-half or one-third of the old rate of duties is now taken, nevertheless the revenue has more than recovered itself within nine years.

Further, these latest trade returns disclose some striking facts indicative of that sort of prosperity which is the real basis of national finance. For instance, India is now taking annually full 20 millions sterling worth of English fabrics, cotton, silk, and woollen. On the other hand, she is sending away annually to England and the colonies some 8 millions sterling worth of her agricultural produce, grains, seeds, and fibres, skins and wool. This, too, is exclusive of opium and cotton. The manner in which the exportation of cotton—on which the wealth of Central and Western India so largely depends—has been sustained, even since the close of the American war, is remarkable. Before the war, that is, before 1861, India used to send to England not more than one-fourth of the quantity which America sent. During the war, while the American production fell off, India exported as much as a million and a half of bales a year, and is still sending but little less than that quantity. The American cotton has now of course regained somewhat of its former position. But still the quantity seems hardly to exceed the 1½ or 1¼ million of bales which India now contributes. The great position which India is acquiring in the cotton marts of England is owing not only to the stimulus afforded by the American war, but to the efforts persistently made by the British Government through its own special commissioners to improve the culture of the indigenous staple, to ensure the produce being properly cleaned and packed, and transported without damage to the seaboard; all which is aided by the pressing with European machinery fast springing into use in the interior of the country. Again, the progress is remarkable with the articles produced in India chiefly through the exertions of our own countrymen. For India is now sending away annually eight millions

Appendix, No. 3. of pounds of tea and 37 millions of pounds of coffee; while the value of her indigo export is nearly two millions sterling per annum, and of her silk $1\frac{1}{2}$ millions. That these results should be achieved through the direct agency of a handful of non-official English gentlemen is one among the many wonders of the time.

Next, for opium, in round numbers the budget estimate showed under $8\frac{1}{2}$ millions: the regular estimate shows upwards of $8\frac{3}{4}$ millions, being an increase of half a million. This arises not at all on the Malwa or Bombay opium, but almost entirely on Bengal opium. So far as can be seen the Malwa opium is yielding much about the amount that was anticipated. The duty being a fixed duty of 600 rupees a chest, the fiscal yield depends entirely on the number of chests sent for exportation, and that number has as yet corresponded closely with the estimate. But the prices obtained at the Calcutta opium sales have gone considerably beyond the budget estimate. In that estimate Mr. Massey assumed a price of 1,250 rupees (125/.) per chest. For the previous year he had assumed only 1,150 rupees. Finding that this latter estimate had been exceeded by the reality, he decided to go higher for this year, and so he took 1,250 rupees, an apparently high rate, according to experience of several recent years, expressing however a good hope that this enhanced estimate would prove moderate, and would be outdone by the reality. And, surely enough, it has been so outdone. For up to date the auction prices have averaged 1,380 rupees a chest, and sometimes have even over-topped the high price of 1,400 rupees. Further, this fiscal increase has accrued notwithstanding that the Bengal authorities have only been able to bring 47,235 chests into the market instead of 48,000, or 765 chests short of what was to have been expected. This deficiency of supply was caused by the shortness of the crop of last year in the Behar province, which for want of seasonable showers was less than it should have been on the area under culture.

The receipt side for 1868-69 being thus satisfactory, how stands the expenditure side? Now here the first noticeable feature is this, that the ordinary expenditure of all kinds, according to the improved definition, has risen from $46\frac{1}{2}$ millions in the budget estimate to $50\frac{1}{2}$ millions in the regular estimate, showing an increase of $3\frac{1}{2}$ millions. But this increase is not really so formidable as it looks; for by the improved classification $1\frac{1}{2}$ millions for military buildings and for communications and embankments, which were excluded from the ordinary expenditure in the budget estimate, have now been included, causing, of course, a corresponding diminution of the extraordinary expenditure. And this leaves two millions of increase to be accounted for.

Now the Council will be glad to hear that this increase has not arisen upon the ordinary civil and military charges incurred in India. On the contrary, these heads of charge show rather a saving than otherwise. For instance, the regular estimate shows a reduction on the budget of 60,000*l.* under the charge for collecting land revenue; of 50,000*l.* for collecting the salt revenue; of 75,000*l.* under law and justice; of 70,000*l.* under police; of 100,000*l.* for the army, and this saving has been effected after defraying the extra charges (some 50,000*l.*) for the recent expedition in Hazara. All these savings speak volumes for the rigour with which economy has been enforced during the year by the various executive authorities, and for the precision now attained in our system of audit and account. On the whole the budget expenditure for civil and military charges in India stood at $35\frac{1}{2}$ millions, and the real expenditure comes out at that very sum with but a slight difference. And even that difference is explained by our having paid 200,000*l.* (not originally estimated for) of Bear surplus to the Nizam in the just discharge of our obligations on that score. Much has often been said of the uncertainty of Indian accounts. These figures go to show that as regards the civil and military expenditure in India—which is, of course, well under our control—there is no such uncertainty, and that what is budgeted for under these heads will not materially be exceeded.

Where, then, has the increase over the budget estimate occurred? Why, it is attributable to public works ordinary, to expenses connected with railways, and to unavoidable expenditure in England, as I must proceed to show.

The budget grant for public works ordinary amounted, according to the improved classification, to $5\frac{1}{2}$ millions. The regular estimate shows that expenditure will be incurred up to six millions, showing an increase of one-third of a million. The increase has arisen from various causes, among which may be mentioned the outlay on central gaols, and the execution of works for the relief of the population suffering from scarcity in the drought whereby some parts of India are visited.

I have just above stated that $1\frac{1}{2}$ millions classed in the budget under extraordinary expenditure had by the new classification in the revised estimate been transferred in the ordinary expenditure. Of this amount, $1\frac{1}{2}$ million is for the great military barracks. As explained by my predecessor last year, the scheme for new barracks for European troops throughout India was to cost from 10 to 11 millions, and the work was to be done in a period of five years. It is hoped that the estimated cost may not be materially exceeded, but to secure this result the most unrelenting vigilance will be needed. Be this as it may, however, the period of construction will certainly be prolonged, for the five years have now elapsed, but the work is not half done; and out of the 10 millions only five have been spent, leaving at least five yet to be laid out. But the designs had to be elaborated by the best military engineers in India, and then sent to the first sanitary authorities in England for approval. Then new sites had to be selected after long inquiry as to salubrity and the like. Thus, despite every care and anxiety to push on the work, the progress for the first few years was not rapid. More recently, however, the plans having become finally settled, and the establishments fully organized, great progress has been made, and during the current year

no less than $1\frac{1}{2}$ million is being expended on these buildings. The result is that noble structures, providing for the married and unmarried soldier quarters equal to the best to be seen in any country, are rising up at Allahabad, at Lucknow, at Hyderabad, at Poona, at Bangalore, at Indore, and at many other stations. Nothing that science can suggest to make these quarters healthy and comfortable for the troops has been omitted. At the present rate of progress and of expenditure, it is hoped that the work will be finished some six years hence, which with the years already occupied will make a period of 11 years.

Out of the 5 millions as yet spent on the barracks, whether the greater part has been really borrowed or not, I shall presently explain. But the remainder, amounting to some five millions, is certainly to be provided for from the revenues without any borrowing on this account. This is a matter lying at the very root and foundation of the Government itself, to which our fiscal resources ought primarily to be devoted. The provision thus required is therefore one of the most pressing needs of the day. And as days are like years in the life of a nation, the meaning is, that the need of the day shall in this respect be met financially in the day, and shall not be put off till the morrow and the day after the morrow. At one time indeed there was hope that inasmuch as this was special expenditure, the advantage of which would be felt for ages to come, the whole cost should not fall on us now living, but should by the process of borrowing be partly transferred to those who shall come after us. But reflection shows that those who come after us will have plenty to pay for without paying for any part of these barracks. Will anyone say that when these barracks are finished there will be nothing more of importance to be done in this direction? Is there not sanitation to be carried out at our cantonments and stations to an extent which at present can be but dimly foreshadowed? Are there not our coast defences and fortifications to be provided for? Is there not our marine to be strengthened, a subject which has been alluded to more than once in this Council? Again, by reason of so large a proportion of our means being appropriated to military buildings, the expenditure on some other kinds of public works, especially roads, has unavoidably lagged and halted. Recently we have not spent quite so much as we once were spending on our internal communications. When, therefore, the financial pressure for military buildings shall be somewhat lightened, renewed vigour will be required for the roads, particularly those which are called railway-feeders, as leading from the interior of the country to the various stations,—which are to supplement our railway system, and to be, as it were, the veins to the main arteries.

Speaking in 1867 regarding this very barrack expenditure, Mr. Massey made a remark which is so apposite and judicious that I shall quote it here. He said, "I should have preferred going on as hitherto defraying this charge, special and temporary as it is, out of the revenues of India. If a financier were to lay down any precise rule of separation between ordinary and extraordinary charge, there is scarcely a year in which he might not have a plausible pretence for transferring charge from revenue to capital account. I do not know how long such a process might go on. But sure I am that sooner or later it would end in a collapse of public credit."

Such was the dictum of Mr. Massey, to which I heartily subscribe. The principle on which canals and State railways are provided for by loan is intelligible. But if barracks are to be thus treated without any clear principle and removed from ordinary expenditure, then I know not what item might not be next removed, till at last we embarked on a course of borrowing that would be fit only for bankrupt exchequers.

There is one instance of decrease under the head of Public Works, which is this; the item of "Loss by exchange on railway transactions" has fallen from 122,760 £. in the budget to only 29,700 £. in the regular estimate. At present the practice is this: in India our exchequer advances all that is required for the construction of the railways, and receives all the traffic receipts, in virtue of arrangements originated so far back as 1849. Both our payments and our receipts are accounted for to the principal railway companies at a fixed contract rate of 1 s. 10 d. for the rupee, a rate as yet below the actual exchange and below the exchange of 2 s. for the rupee, which for convenience sake is adopted in all the accounts between the Secretary of State and the Government of India. Thus there is a loss on all our payments and a gain on all our receipts, in the present state of the exchanges. As yet our payments exceed our receipts and the loss therefore exceeds the gain; the net result being as shown in the statement. Hereafter, when, as we may hope, the net traffic receipts shall exceed the advances for construction, the loss will disappear, and in its place there will be gain on exchange. Meanwhile the loss in this year has been less than the estimate, partly by reason of increased traffic receipts, and partly because the advances for construction have been less than what was expected.

The several items of Public Works Ordinary which I have thus described make up the total to six millions, which total amounts to about 12 per cent. upon the revenues.

The next noticeable item is that of "guaranteed interest on railway capital, less net traffic receipts," which has risen from $1\frac{1}{4}$ million in the budget to nearly $1\frac{1}{2}$ million in the regular estimate; or showing an increase of nearly half a million. This has arisen from the estimate in India for gross traffic receipts being less than what was originally expected.

This technical description is really pregnant with significance as representing transactions of mighty import. For what does it signify? Why, it signifies that on 77 millions of capital raised for the construction of railways in India, there accrued during the year 3½ millions of interest due to the shareholders under guarantee from the Indian Exchequer; that the gross traffic earnings of the year on 4,000 miles of railway opened in India amounted to 5½ millions paid into our treasuries, reduced by the exchange to 5¼

Appendix, No. 3. millions; that the working expenses, amounting to 3 millions, left $2\frac{1}{2}$ millions of net traffic receipts; that the $2\frac{1}{2}$ millions net traffic receipts deducted from the $3\frac{1}{2}$ millions of guaranteed interest left a sum of $1\frac{1}{2}$ million shown above as ultimately debitable to the finances of the year. Originally there used to be doubts as to whether the natives of India would adequately appreciate railways. The truth is, that during this present year the public in this country is voluntarily paying 6 millions sterling to obtain the advantage of railway conveyance for passengers and goods, that in the year some 3 millions of tons of goods are conveyed by rail, and that the return of passenger journeys amounts to 16 millions. As regards the national growth of British India it is difficult to conceive figures more eloquent than these.

In the first budget statement ever submitted to this Council, in 1860, Mr. Wilson gave the gross traffic receipts for that year at a little over half a million, and the working expenses at a quarter of a million, leaving a net receipt of something over a quarter of a million. This he declared to be "a most gratifying fact, one which augurs well for the future." Would that he were now alive to hear that in this the 10th budget statement, submitted to this Council the half million of gross receipts had grown to near six millions, and the quarter of a million of net receipts to between 2 and 3 millions; that within 10 years the increase had been tenfold or nearly elevenfold.

The last item to be noticed is that of net expenditure in England, including stores, which has risen from $6\frac{1}{2}$ millions in the budget to $7\frac{1}{2}$ millions in the regular estimate, showing an increase of more than three-quarters of a million. This account being received from the Secretary of State must be implicitly accepted. The augmentation has arisen under various heads, such as the Indo-European telegraph; the marine stores; the passage of officers and troops overland. There is one important item actually incurred and not provided for in the budget, namely, 92,000 £. for the construction of two monitors or floating batteries for the defence of the Bombay harbour. Considering the needs of that harbour we feel particular pleasure in admitting this item into our accounts of the year.

Thus I account for an ordinary expenditure of $50\frac{1}{2}$ millions, which, as compared with the ordinary income already shown, $49\frac{1}{2}$ millions, leaves a deficit of just 1 million.

Under the head of Extraordinary Public Works, the first item is the outlay on irrigation works, for which 800,000 £. were provided in the budget, but on which 852,000 £. are being expended in India. One main cause of the increase is the amount advanced by the Government to enable the Irrigation Company of Orissa to prosecute its life-giving works during a period of awful distress in that province, and by the immediate outlay consequent on the prosecution of these operations being undertaken by the State.

The next item is that of nearly half a million for special works at Bombay, which item really represents advances from the treasury for certain reclamations and other operations on lands at Bombay, advances which we hope to recover hereafter when the value of the said property shall be realised.

Under the same head we have, subject to the approval of the Secretary of State, opened out a new heading, which was not provided for in the budget, and that is "State Railways." These are reproductive works, calculated to yield an actual income to the State sufficient ultimately for the provision of some interest on the capital outlay. In his statement before this Council last year Mr. Massey alluded to the commencement, by direct Governmental agency, of the construction of the railway from Lahore to Peshawur. Though important preliminary arrangements have been made during the year for this line, yet the expenditure is trifling, only 12,000 £. The sum which now appears in the regular estimate, half a million, is nearly all for the Calcutta and South Eastern Railway, which, as the Council knows, runs from this city to the new Port Canning on the Mutla river. This line has been taken over by the Government at a charge amounting in the aggregate as above. Of this, nearly 200,000 £. have been incurred in India, and the rest in England. At first the line was unremunerative, but under its present good management it begins to pay its working expenses.

The total extraordinary expenditure, including the sums above mentioned for irrigation, for special works at Bombay, and for State railways, will amount to $1\frac{1}{2}$ million. This exceeds the corresponding expenditure of the preceding year, 1867-1868, which was under three quarters of a million.

On the whole, the grant for the public works, ordinary and extraordinary, of the year amounted to close upon seven millions, and is about as large a grant as has ever been made. But it is being exceeded by the expenditure, which will amount to $7\frac{1}{2}$ millions, the excess being three-quarters of a million, and the expenditure being decidedly the largest ever yet attained in one year. It is important to notice this, because, in former budgets, consideration has been justly had to the probability of the grants or allotments for public works not being fully used.

The result of the regular estimate, then, is an ordinary expenditure of $50\frac{1}{2}$ millions, which, with an extraordinary expenditure of $1\frac{1}{2}$ millions, swells to 52 millions. The $50\frac{1}{2}$ millions of ordinary expenditure, compared with the revenue of $49\frac{1}{2}$ millions already exhibited, shows a deficit of one million. The 52 millions, including extraordinary expenditure, shows a deficit of $2\frac{1}{2}$ millions. The Council will remember that the budget estimate showed a total expenditure, ordinary and extraordinary, of $49\frac{1}{2}$ millions, against a revenue of $49\frac{1}{2}$ millions, with a deficit of one million. But, as the year advances, it is seen that this deficit is becoming more than doubled in the regular estimate, and the expenditure of the year is exceeding the budget by $2\frac{1}{2}$ millions. I may state, in recapitulation of what has been already explained, that this excess has hardly at all arisen on civil and military expenditure

expenditure in India, but has really arisen on the purchase of a railway by the State on the guaranteed railway interest, on public works ordinary, and on the expenditure in England.

Appendix, No. 3.

The Council will remember that, in his statement of last year, Mr. Massey mentioned that we should begin this twelvemonth with 800,000*l.* in hand, unexpended balance of loans, and expressed a hope that no borrowing would be resorted to during the year. It will now have been seen that the above balance has been more than used up for irrigation alone. Besides that there have been the other extraordinary works above described. And it has accordingly been found necessary to borrow to a limited extent in England, that is, about three-quarters of a million.

		£.
Raised in England -	-	1,286,000
Less debt discharged -	-	502,000
		<hr/> 733,400 <hr/>

We began the year with a cash balance, as now actually ascertained, of 12 millions, which was at that season enough, and no more. Besides the increase of the deficit, these balances were reduced to the lowest ebb compatible with safety, by an important cause which I will now mention.

During the past and the present years (1867-68 and 1868-69), the Indian exchequer has had to advance most of the sums required for the expedition to Abyssinia. These advances, from first to last, have amounted to about seven millions, being fully two millions more than the anticipation. This aggregate represents only the sums chargeable to the English Government, exclusive of the ordinary pay of the troops that proceeded from India, which is chargeable to India. With such events in progress, all foresight as to the total amount was of course baffled. These sums are recoverable from Her Majesty's exchequer, and they are being duly recovered from time to time; the greater part, indeed, has now been repaid. But as the advances had to be made on the instant, and as the recoveries must necessarily occupy some little time, the pressure meanwhile became severe on our treasury. As temporary emergencies arose, the Bank of Bengal and the new Bank of Bombay rendered aid, partly with their own available balances, and partly with the balances which the State has to keep with them under the agreement. Besides this, the Bank of Bengal afforded temporary and special loans which, from first to last, aggregated 1½ millions. These loans have been already paid off in part, and the rest is in course of repayment.

Further, the accounts of the expenditure incurred in India for Abyssinia are being made up at Bombay. Although the forces only in July last returned from the expedition, yet by this date some six millions, or nearly the whole of the expenditure, have been adjusted and passed. Those who remember how the accounts of former campaigns in Afghanistan, in the Punjab, in China, used to drag their length over years and years, will appreciate the changes which have been introduced into the account department.

Thus ends the year 1868-69, with a deficit on ordinary income and expenditure, being the third consecutive year on which deficit is leaving its mark. The deficits of the three years amount to just 4½ millions, total deficiency on income and ordinary expenditure, viz., the deficit in 1866-67 of 2½ millions, that in 1867-68 of 1 million, that in 1868-69 of 1 million. These are, of course, exclusive of the extraordinary expenditure since 1867-68 on reproductive works, which I do not reckon here at all.

But how has this aggregate deficit of 4½ millions been met? Why, by loans. During these three years 6½ millions have been borrowed, either in India or in England, and added to our national debt. Of this sum there were 2 millions expressly borrowed for extraordinary and reproductive works, and certainly this money has been fully and fairly devoted to its proper purposes, for during the three years the total outlay on irrigation and on the Bombay special works have exceeded 2 millions; indeed it has come up to 2½ millions. Besides which one railway has been purchased for half a million. So that in truth we have spent 3 millions for these reproductive works. Again, for the barracks 3½ millions have been expended within the three years. Thus the loan money is fully accounted for.

Years.	India.	England.	Total.
	£.	£.	£.
1866-67 - -	600,000	2,611,000	3,211,000
1867-68 - -	1,320,800	1,163,907	2,493,707
1868-69 - -	-	724,000	724,000
		<hr/> TOTAL - - £.	<hr/> 6,428,607 <hr/>

On the other hand, as the barracks are now included in the ordinary expenditure, the 3½ millions spent on them within the three years may go far to account for the 4½ millions of deficit. In other words, it may be said that the balance of the loan, after defrayal of the reproductive works expenditure, which balance amounts to just 3½ millions, has gone to make good in part the deficits between income and ordinary expenditure.

From this point of view we might hold that had it not been for the barracks, the deficits on ordinary income and expenditure would not have occurred, and these loans would not have been necessary. But it would thence follow that the new barracks have, for the most part, been constructed from borrowed money.

When my right honourable predecessor (Mr. Massey) spoke of surplus or equilibrium during these years, he was correct according to the view then adopted, whereby the barracks were excluded from the account. Now, however, that it has been decided, with the express sanction of the Secretary of State, that these are to be included, we must face the plain fact that we have been and still are in a state of deficit. It is essential to place this fact in a clear light, in order that we may adequately arrange for the coming year. For the difficulty, though not serious, is yet such as to demand decisive measures for its immediate termination.

But while giving this explanation in justice to what has been previously done, I do not at all mean to admit that the barracks ought to be selected as the cause of deficit. On the contrary,

Appendix, No. 2. contrary, I say that barracks ought not to be thus singled out from our general expenditure.

Before quitting the present year I must crave a few moments for the mention of one or two administrative measures connected with finance.

The circulation of the State paper currency has now risen above 10 millions, it has more than once approached 11 millions. When the Government took this matter up six years ago, the total note circulation of the several Presidency banks amounted in all to 3½ millions. Within this period, then, the circulation has trebled, and has now reached to about one-third of the amount, 30 millions, which its founder, Mr. Wilson, contemplated as the possible limit to which paper currency in India might ultimately expand. It has established itself not only at the Presidency towns, but at the great centres of the interior of the country, such as Allahabad, Lahore, Nagpore, and Kurrachee. During the year we have, by purchasing three-quarters of a million of public securities—virtually reducing the national debt by that amount—raised that portion of the reserve from 3½ millions to 4 millions, the limit allowed by law. This measure was justified by the steady expansion of the circulation. The gross profits to the State from the Currency Department will amount to 170,000*l.* annually. The notes, too, are used by merchants to the value of some millions annually for purposes of remittance, whereby great convenience has accrued to trade. Further improvements in the arrangement of circles of issue in order to facilitate the convertibility of the notes are under consideration.

The amount realised from the sale of waste lands now amounts to 300,000*l.* This has been invested in Government securities, public debt to this amount being regularly cancelled. This seemed necessary in order to give full effect to the intention of the law.

The provision of an effective gold currency for India has engaged our earnest attention. The offer of 10 rupees for the sovereign at our treasuries by the notification of 1864 having been found by experience to be insufficient to attract sovereigns and to fulfil the declared intention of facilitating the circulation of that coin, we determined in November last to offer *Rs.* 10. 4. for the sovereign, a rate more nearly approaching to its intrinsic and market value. This measure has met with some success, for already upwards of 100,000 sovereigns have been received at our treasuries and taken out again by the public. We have also removed the prohibition existing since 1852 against receiving at our treasuries the gold pieces coined under Act 17 of 1835, of which coin numbers (more than 1½ million) have been and still are being coined at our mints in exchange for gold bullion received from the public, a sure proof of the popular demand for them. Thus, by improving the rate offered for the sovereign, by assimilating it to the standard established by law for coinage of gold in India, by restoring the status which the Indian gold coins properly possess, and which they only lost casually in 1852, we hope to obtain such a circulation of gold coins in India as may hereafter justify their being declared to be legal tender. I cannot pass from this topic without recounting the aid derived from the special knowledge and experience of Mr. Dickson, Secretary to the Bank of Bengal, and of our colleague, his Excellency Sir W. Mansfield. Indeed if India, by the means now adopted, shall enjoy the benefit of a gold currency, that will be largely owing to the exertions of his Excellency.

The Government savings banks at the three Presidency towns are flourishing; they have in all some 25,000 depositors, chiefly native, and some 650,000*l.* of deposits. Their success has encouraged us to devise measures for the ramification of these institutions throughout the interior of the country.

The "Money Order Department," established on the model of similar departments in England, has attained a considerable development throughout India. Its transactions during the year amount to an aggregate of a million sterling. The further expansion of the system is under consideration.

In the Postal Department we have decided to carry half a tola, instead of the quarter tola, for half an anna. This concession to the public is justified by the increase of correspondence since the reform of the postage in 1854, the number of covers, public and private, having risen from 30 to 70 millions annually; the receipts from private postage having risen from 200,000*l.* to 400,000*l.* per annum, and the department having so extended as to cover 50,000 miles of communication, and to number 20,000 employes.

Following the postal principle, we have substituted for the electric telegraph fixed rates for all distances, instead of the former tariff, variable according to distance. Accordingly, a message of 10 words can be sent to any part of India for a rupee. It is hoped that a stimulus will be hereby applied to telegraphic communication in this country.

The prices commanded in the market by our Government securities have been satisfactorily high. During the current year the premium on the Government 5 per Cent. stock have ranged up to 10 per cent.; those on the 5½ per Cent. stock up to 15 per Cent. The prices of the Indian stock created in England appear to have been at least as favourable, perhaps even more so. These rates indicate that our credit stands as high as, or higher than, ever, and will bear comparison with that of other prosperous nations. Such facts, too, contrast happily with the state of things but a few years back, when our stock was at discount, and when our open loans would not fill. But this credit, so mighty a resource to Government as well as to individuals, can only be maintained by our ensuring public confidence in our firmness and resolution to produce an equilibrium of income and expenditure.

I must acknowledge, after trial and proof, the remarkable improvements introduced into our system of audit and account by the Commission from England, consisting of Messrs. Foster and Whiffen, appointed at the instance, and acting under the supervision of my predecessor, Sir Charles Trevelyan.

I have

I have given much thought to a subject which has long engaged the attention of the Government of India, namely, the financial relations between the Central Government of India, and the Local Governments of Madras and Bombay. I cannot say more at present, as the question is still under consideration.

I have now cleared the way for dealing with the third and the most interesting part of my subject, namely, the budget estimate for the coming year, 1869-70. I shall touch first on the receipts, and then on the expenditure.

The total of the revenues for the coming year is taken at 49½ millions, being a little over the amount which we are receiving for the present year. This total of 49½ millions is the highest at which the revenues of British India have ever been set down, and it exceeds by three-quarters of a million the budget estimate presented this time last year. The Council will be doubtless gratified to see that I am able to present such a statement; still a glance at the main items of revenue will show that the estimate is scrupulously moderate. The great heads of land revenue, of customs, of salt, of opium, are all taken at fairly low figures.

If the seasons had been less unpropitious than they have been, then these amounts might have been higher. If we shall hereafter be blessed with copious and timely rain, the estimate of income may be fortunately exceeded.

Regarding those items which depend on the state of trade, we have framed our estimate after consulting all the best informed authorities on the spot, and after revising the tariff valuation, in order to suit the depressed prices obtained for various staples of commerce.

Regarding those items which depend on the state of the harvests, we have looked to the consequences of the drought by which some parts of India have been suffering. The recent rains, life-sustaining, though so long delayed, with which the country has been refreshed, have no doubt improved our prospects. The gloom which overspread some provinces has been brightened, and drooping spirits have been resuscitated among an industrious population which had for months been gallantly struggling with adverse circumstances, alternating between hope and despair, and striving with fortitude, diligence, and foresight, to supplement, artificially, those resources which the natural seasons had failed to afford. At this crisis the railways have been of signal service to humanity, for they have carried, first and last, some 50,000 tons of grain food to the hunger-stricken districts during this season. The Ganges and Jumna canals, too, have, during the year, nearly doubled their irrigation, and have watered nearly a million of acres. So praiseworthy have been the efforts of the people, that even now, at this late hour, it is thought that the worst, for which we were so fully prepared, may yet be averted, and that if only a bountiful rain shall be vouchsafed next season, the country will recover from the effects of the visitation. In that case the agricultural resources, on which our land revenue depends, may not prove to be impaired, and the tolerably favourable estimates now presented may stand good. But if the next rains shall be at all unpropitious, and a second misfortune be piled upon the first, then the result will be too sad and serious for anticipation.

These considerations have specially affected the opium revenue. The province of Behar, the very home of the poppy, has been among the most drought-stricken districts of all. The crop, short last season, will be shorter still this season. The number of chests brought to sale this year has been below the standard* by some hundreds of chests; next year it may be deficient by some thousands. For Bengal opium the exact number of chests has been taken month by month. This number is certain for three-quarters of the year. The uncertainty is in the price to be realised per chest. The average price has been assumed at 1,330 rupees (133 L.) per chest, that being about the average actually realised during the past three years, though less than the average, 1,380 rupees (138 L.) per chest, obtained during the current year. For the Bombay opium, the full amount has been taken according to the experience of the present year. The total result of the opium revenue has been further tested by the gross average of the past three years, which, amounting to 8½ millions, sufficiently bears out the sum, 8¼ millions, now set down. Thus, although the sum estimated for the coming year is half a million less than that which is being realised in the current year, and is below the average of the three past years, thus showing a really cautious estimate, yet it is as high a sum as could safely be taken in the face of the deficient supply with which we are but too certainly threatened. The Council will see that the whole of the expected revenue has been taken credit for without any reserve being formed.

The Government of Bengal is taking active measures for increasing the supply of opium for the China market to 60,000 chests annually, and for securing a reserve supply (of at least 10,000 chests) which may assure the public as to the quantity to be brought to sale, and may conduce to the checking of undue speculation in prices. There is fear that unless the supply can be improved next season after these two deficient seasons, the cultivation of the poppy in China itself will be stimulated. For some time past positive accounts have been received of the increase of this culture in China; so it is clear that unless Bengal produces enough opium, the Chinese will raise it for themselves, and if the Chinese will have opium, they may as well get it first rate from us, as second rate at home, and they may as well consume it taxed as untaxed. Again, if they do not procure it from us, they might procure it from other countries of Asia. The culture of the poppy in Persia is increasing, and some 4,000 chests are exported annually from that country to China. The propriety of substituting an open excise system in Bengal for the present direct governmental agency has been under consideration; but the propriety of such a change on either moral or practical grounds is not as yet established to our satisfaction. On the other hand, it is a serious thing to make a change in a case where such critical interests are concerned, where, despite fluctuations, the fiscal progress has been so great and so steady, and

Appendix No. 3. where the system works well to the satisfaction and contentment of the peasantry concerned in the cultivation.

The revision of the salt duties throughout India has engaged, and is still engaging, our anxious consideration. The inequality in the rates of duty, and the market prices of such an article as salt in different portions of the empire, is indeed to be deplored. But though there are present obstacles, financial and other, in the way of equalisation, we shall bear this steadily in view as an object for ultimate attainment. But after all, what the northern people want, even more than reduction of duty, is increased facility of supply by the construction of railways to the saliferous tracts, and by the encouragement of local manufacture of salt, to all which matters immediate attention is being afforded.

As the Council knows, there is a revision going on of the schedules of the stamp duties; but no provision has been made for the fiscal effect of any changes, as they have not yet been finally determined.

The item of assessed taxes I shall reserve for separate mention after the balancing of income and expenditure.

Such, then, being the receipts, how stands the expenditure for the coming year?

The total of ordinary expenditure is set down at 49½ millions, being some 50,000 *l.* below the total of receipts. In other words, there is a real equilibrium between expenditure and income sufficiently assured by the exhibition of a small surplus of 50,000 *l.* This expenditure is one million *less* than the expenditure of 50½ millions for the current year, 1868-69, incurred for precisely the same purposes, and thus accurately compared.

There is a slight increase, after every practicable retrenchment, in several of the Civil Departments. The Council would be wearied if I entered on the details of this. Suffice it to say that the demands for administrative improvement in every direction are irrepressible; and these involve expense. Again, the general rise in wages and in prices of all things, which have doubled or even trebled within the last few years, and are still on the ascendant in most places, has for some time past caused, and is still causing, the former scales of pay and of salaries to prove insufficient. In justice to the many classes of its meritorious servants, the Government has been obliged to concede increase of emoluments to the employés of all grades, from the lowest upwards, in all departments, from 15 to 30 per cent. The only general exception to this has been the case of the Covenanted Civil Service, of which the emoluments remain much as they were.

There are only a few items of expenditure which need now be noticed. That for police amounts to nearly 2½ millions. The police of India under its new organisation was originally estimated to cost two millions; the subsequent tendency to increase has been largely owing to the establishment of municipal police.* Much care will be needed if the sum total is to be kept down at its present figure. The educational grant stands at upwards of 900,000 *l.*, or nearly a million, being slightly above the expenditure of the current year. The allotment for law and justice, including prisons, now exceeds 2½ millions; and is constantly increasing from the creation of new courts and departments. The grant for medical services has risen about 15 per cent. within the last two years. This is owing to the substantial recognition of the medical profession by increased pay, and to the position which sanitation is fast asserting for itself. The cost of forest conservation is also rising: this is attributable to the organisation of professional forestry, and to the husbanding of that vast wealth in timber with which nature has endowed the continent of India.

The military expenditure in India is estimated at upwards of 12½ millions, being almost the same amount as that which is shown for the current year. This is of course exclusive of some 3½ millions of expenditure in England. The sums of 21 and of 16 millions are the highest annual figures which our military expenditure in India has reached. After the great retrenchments which took place between the years 1860 and 1863 upon the above amounts, the sum of 12½ millions (in 1863-64) is the lowest figure to which our military expenditure in India has fallen. Since then the charge has slightly increased, notwithstanding that the European force has been reduced by some 7,000 men. It might be expected that such a reduction of force would have caused a considerable reduction of expenditure. Instead of this, however, there has been an *increase*, despite constant efforts to keep down the charges, a fact which points to the need for redoubled economy. The increase, so much to be regretted, is in part attributable to unavoidable causes, such as—

The warrant regarding the clothing and pay of the European troops, and the inducements to re-engagement at an earlier date.

The increased subsistence allowance to the wives and families of European soldiers.

The additional pay allowed to Native commissioned officers; the grant of good-conduct pay to the sepoys at an earlier date; the continuance of batta to men on leave; the increased rates of hutting money.

The increased pay of medical officers, of the medical staff and establishment, the re-organisation of the warrant or subordinate medical establishment.

The abolition of half batta.

The net cost of the staff corps.

The compensation to Native troops for nearness of provisions.

These main items have caused an increase of annual charge by 950,000 *l.*, to counter-balance which further savings are required, if such can possibly be made. Certainly there

are

* For the charge for municipal and railway police there is a set-off on the receipt side of 900,000 *l.* for municipal and railway contributions credited to the State.

are categories of increased charge which call for restraint. The commissariat charges, though in some places creditably economical, are hardly so in all places. The charges of the hospital departments, of the Ordnance, of the barrack department, of the stud, of the army and garrison staff, are constantly mounting upwards.

The charge which some years hence will accrue to the State from the present organisation of the staff corps of India has engaged our anxious care. The question as to what measures should be adopted in respect hereto is still under consideration.

Doubtless the growth of army expenditure, though slight and gradual, requires check in every branch and detail, which check we shall assiduously apply.

For Public Works Ordinary, exclusive of railways, the allotment stands at 5½ millions, being just over the amount expended in the current year, and being about the largest grant ever yet made for this important object. It includes nearly 1½ millions for the military buildings, of which the importance has been already explained, an amount which will enable the engineers to maintain the present rate of progress. This category includes all the expenditure for these buildings, of which not a farthing has been transferred to the heading of Extraordinary. Further, in Public Works Ordinary, including railways, every kind and sort of item has been included, save those for new irrigation works, for the Bombay special fund, and for State railways, which three items alone have been classed as Extraordinary.

The guaranteed interest on railway capital, less net traffic receipts, stands at 1½ millions, making up to about 15 millions, the amounts which the Government of India from first to last has paid for the cardinal advantage of possessing railways in the country. Inasmuch as the outlay for the thousands of miles of line yet to be constructed will be going on to the amount of three or four millions annually, it is calculated that this item of 1½ millions for guaranteed interest will not decrease for many years to come, but may increase to 1½ millions. It is manifest that much depends on the administration of the railways, the merits or demerits of which might easily make a difference of a quarter or half a million in the State budget of the year. The growing importance of railway finance will hence be apparent to the tax-payers of India. After deduction of the working expenses from the estimated traffic earnings of the coming year, it is calculated that the East Indian Railway will be paying 4½ per cent. on paid-up capital, the Great Indian Peninsular three per cent., the Madras Railway three per cent., and the other lines from one to two per cent. It seems clear that some of the lines will certainly pay the five per cent., and will relieve the State of its guarantee obligation on more than half of the capital as yet laid out. But the remainder will not pay for some time to come, involving perhaps one-third of the aggregate capital, on which the State will have to pay permanently a part of the guaranteed interest. It is well to remember this, inasmuch as within the next 10 years another 30 millions on railways may probably be expended.

Such then, is the ordinary expenditure for the coming year, which has not been allowed to overbalance the income. But in order to explain exactly how this equipoise has been obtained, I must ask the Council to revert to the item of assessed taxes, of which I just now promised a further notice.

It will be seen that 900,000 £. are set down as the anticipated produce of assessed taxes for the coming year. The certificate tax of the current year is expected to yield 520,000 £. The same tax, had it been continued for the coming year, is supposed to be capable of yielding as much or more, say 550,000 £. But to this has been added 350,000 £., making up the total of 900,000 £. shown in the budget. Now, by what means is the extra 350,000 £. to be obtained? Why, by converting the certificate tax into an income tax. Without this resource our income would fall short of our expenditure by more than one-third of a million, and a deficit to that extent would have been exhibited in this budget. The Government of India, after considering the deficiencies which have occurred in three consecutive years, as I have already explained this day, and after causing the accounts to be made up according to the orders of the Secretary of State, has determined, so far as in it lies, to put an end to deficit. We cannot, at such a time as this, consent to appear before the public with a deficit in our budget. We have therefore preferred the alternative of asking this Council to vote us the power to cover by an income tax the deficit which must otherwise be presented. Such, then, is the proposal which I shall have, on behalf of the Government of India, to submit to the Council, together with a request for leave to introduce a Bill for the purpose. The necessity of avoiding debt in time of peace for ordinary expenditure, and of plainly making both ends meet, is the ground on which we mainly base this proposal. The probable occurrence of this necessity was foreseen some months ago, and a reference was made by us to the Secretary of State, whose approval has been received to the course which we propose to adopt.

The principle of the existing certificate tax is in fact that of an income tax on particular classes, so that the substitution of an income tax proper will practically not much alter the taxation of those who pay the certificate tax. The taxation will be virtually extended to those sections who are now exempt, and will apply equally and justly to all sections alike without distinction. Moreover, the principle of rough assessment, as observed in the certificate tax, should, we think, be maintained, with some modification of detail, in the schedule of the income tax. The mean incidence of the certificate tax was about 1 per cent. on profits; we propose to keep this rate for the income tax also. The limit of income down to which the certificate tax descended, 500 rupees, (50 £.) per annum, will be observed in the income tax. Servants of Government or of companies, as well as those of firms and private individuals, were exempted under the certificate tax if their salaries were less than 1,000 rupees for the year. For the former class the assessment will now be at 1 per

Appendix, No. 3. cent. on all salaries of *Rs. 41. 10. 8.* per mensem, equal to 500 rupees per annum, and upward. The latter class will be assessed like their neighbours under the schedule. Pensions and annuities will be similarly assessed. We have introduced various minor improvements intended for the convenience of the tax-payers.

The advantage of keeping up the principle of rough assessment in the schedule is the avoidance of individual assessment, of any inquisitorial process which such assessment may involve, and of the demand for returns of income. The advantage of adhering to the 1 per cent. rate will be this, that those who pay the certificate tax will continue to pay much in the same way as heretofore, without any sensible change, and the avoidance of change is well known to be an important point in dealing with the natives of India. The advantage of observing the 500 rupees (50 *l.*) minimum limit of income will be this, that the measure will be confined to the upper and middle classes, and will not affect the mass of the people. In that respect the new income tax will be preferred to the old, which went down so far as 200 rupees (20 *l.*) of annual income. It is calculated that not more than 150,000 persons will be assessed to this income tax, out of 150 millions of population, so that the tax will hardly touch more than one in a thousand. In short, our hope is that by eschewing change in respect to those who now pay a direct tax; by refraining from demand for returns; by removing the measure from any contact with the poorer and more ignorant classes, we shall keep it comparatively free from much of the unpopularity which attached to the income tax of 1860, and thus, as it were, rob the measure of its sting.

Should it be thought that the arguments, if good for anything, are good for a 2 per cent. rather than a 1 per cent. rate, the answer is that 1 per cent. seems to be sufficient. It produces an equilibrium after a fair allowance for the defence and administration of the country, and for moral and material improvement, and after including enough for military buildings to ensure the present rate of progress. The Council will remember that all other taxes ever contemplated have been condemned; that the income tax is our chief fiscal reserve; that in war or other emergency we could hardly assess it at more than five per cent., so that now in time of peace we are to use up one-fifth of our fiscal reserve. It is desirable not to trench more than is absolutely necessary on such a reserve. It is also desirable not to ask the country to bear even a fraction weight of burden more than can be proved to be indispensable.

If it be said that sufficient care is not given to retrenchment of expenditure, and that by a little more cutting and clipping a small deficit might be obviated without putting on an income tax, the answer will be that retrenchment has been already pushed to its reasonable extremity in order to cut the coat of our expenditure according to the cloth of our income. It is perhaps a curious fact that when the materials of this very budget were received from the eight local governments, the 12 imperial departments, the 226 treasuries, and were collated in the Financial Department at Calcutta, the revenues came out less, while the ordinary expenditure proposed was more, showing a balance against the country. This adverse account has by scrutiny in the financial department, and by help of the later and more complete information available to us, been reduced to the equilibrium now presented to this Council. After all, the expenditure in India is taken at less by half a million than what it is for the current year. This may be accepted as some proof of economy in the budget. Further than this we cannot retrench at present. If we were to do so, the parties concerned would during the course of the year remonstrate, and we might be virtually forced to allow items which had been disallowed. We hope to maintain the retrenchments so carefully made; but it would be worse than futile to attempt any retrenchment which cannot be maintained.

If it be supposed that we might have devised other means of improving our resources and thus saved the necessity of an income tax, then I say that no supposition could be more unjust to the Government of India. For we have over and over again thought of every tax that has ever been suggested; to almost all some insuperable economic objection was apparent, the income tax alone remaining comparatively free from objection, as hampering no particular trade and fettering no industry. We have even refrained from doing some things we wished to effect, such as the abandonment of some of the export duties which are shackles on our domestic industry, the diminution of the rate of import duty on some metals of which the prices are depressed, the abolition of the inland sugar duties, the reduction of the salt duties in some provinces. We really have postponed the fulfilment of these our cherished desires, in order that the saddle of the income tax might sit lightly and easily on the country.

If it be urged that there is hardship in the imposition of an income tax, when the necessity might be avoided by transferring the cost of the new barracks to the extraordinary category, inasmuch as the work, though heavy now, will soon be finished off and disappear, this argument has been already answered to-day. It suffices to recapitulate that there is no sort of reason why barracks should be selected in such an arrangement more than any other item of our ordinary expenditure; that the work will not be done for years and years to come; that when it is over, other works just as costly will be turning up; that the European troops must be properly housed; that the housing of our soldiers is among the very first charges against our revenues; that the running into debt for such a purpose would be intolerable; that we *must* pay our way to this extent in time of peace, if we are to prove worthy of our status as a Government; and that any such arrangement would be contrary to the orders of the Secretary of State.

Again, if it be argued that the income tax, having been first imposed when the finances were in disorder, ought not to be re-imposed now when the finances are flourishing, the
reply

reply would be, that experience does not show that we can afford altogether to dispense with direct taxation. For, when after a period of deficit, a short period of surplus enabled Sir Charles Trevelyan to allow the first income tax to expire, there followed but one year of surplus. Then sure enough deficit reappeared, and Mr. Massey was obliged to propose a license tax (1866-67). Thus, no sooner had the income tax expired, than its resuscitation in another form became necessary. The license-tax having lasted for a year, Mr. Massey resisted all demand for its repeal, and continued it in an improved form as a certificate tax. That he was perfectly wise in so doing is proved this day, when I have to come before the Council with the longest story of deficit that has been narrated for some years. The moral of all this is, that the great convulsion of 1857, so fraught with trouble, yet so fruitful in reform, does to this hour make its effects felt, and that the country must brace itself to bear the small sacrifice of a light income tax in consequence.

Lastly, though this income tax is applicable to all alike above a certain limit of income, there are some important classes who immediately occur to our thoughts, such as the fundholder in India, the landholder and house-owner, who will be required to aid in bearing a burden already borne for the last two years by several classes of their fellow subjects. The fundholder in India, conscious that the value of his property in the market so largely depends on the financial credit of the Government, will not demur to a contribution to a tax which in England has been always held to be applicable to income from the public securities. The landholders, especially the zemindars under permanent settlement, convinced from long experience of the inviolable faith kept with them by the State, cannot regard this measure with any distrust, but will submit to the law, if it shall be enacted, with that loyalty which befits gentlemen of accumulating wealth and of liberal education, recollecting that the question of their liability was thoroughly settled long ago, and that in each cycle of years the progress of Bengal, with its staples profitably exported to England, its network of water communication, its patient and thriving peasantry, enhances their debt of gratitude towards the Government under whose sway their property has been so vastly benefited.

The European community for the most part already pay the certificate tax. Their taxation will be changed but little, if at all by the income tax. They have shown so much public spirit in respect to direct taxation whenever its necessity was demonstrated, and they are so well aware that financial solvency is one of the first conditions of our political safety in this country, that their support on this occasion is confidently anticipated.

And everybody, European or Native, will, we trust, appreciate the justice of taxing all classes alike without exception.

The question of allotting to the local governments a portion of the income tax proceeds for public works has been considered, but the concession cannot at present be made.

So much then for the ordinary income and expenditure.

Besides this, however, there is a proposed extraordinary expenditure of three-and-a-half millions, of which two-and-three-quarter millions are for the irrigation works, and the rest for the Bombay special works and the State railways. The amount may seem large, but it includes one million to be paid in England for the transfer to Government of the Irrigation Company's projects in Orissa and Behar, and a quarter of a million of stores and plant for the Lahore and Peshawur Railway. This full sum, if sanctioned by the Secretary of State, will have to be raised by loan. The expenditure in India of 1½ million on irrigation is to be mainly for the noble projects in Orissa, in Behar, in the Cis-Sutlej States, in the basins of the Jumna and the Ganges in Lower Bengal, in the British Deccan, and in other places. This will be the first year in which the principle of borrowing for reproductive works comes into something near full operation. It must be some time before any return is received for this outlay. And for fear of going too fast ahead, we should pause before exceeding the amount proposed for loan this year. The original cost of these works is already shown in our Budget Statements; the question as to how far it may be possible to show separately the gross income, and the current expenses of these reproductive works, is undergoing careful consideration.

Indeed we are launching out on a sea of improvement. The next 10 years may see another 40 or 50 millions for reproductive improvements added to the existing 100 millions of our national obligations. Can any fact be more potent than this to prove that we must gird ourselves for the task before us, by establishing that equilibrium between income and ordinary expenditure which will be the surest basis of our public credit.

The total expenditure for the year, ordinary and extraordinary, is put at 52½ millions, the highest figure ever yet reached. It has been sometimes observed that our present form of Budget Statement (which is, however, authoritatively prescribed), by showing the expenditure in England in the aggregate, does not exhibit in one view the cost of some great departments whose expenses are incurred partly in England and partly in India. I append a supplementary statement showing the combined expenditure, English and Indian, of the several departments. In this point of view, the cost of the army stands at a little over 16 millions; that of marine at something under one million; and the interest on the public debt at 4½ millions, of which the sum of 180,000*l.* is on capital raised for reproductive works.

I have now to mention what loan arrangements will have to be made in order to meet all this expenditure. On the one hand we have to provide for 3½ millions for reproductive and extraordinary public works as above described; half a million of public debt to be renewed in England, and half a million in India, or one million to be renewed in all; half a million to be raised in India to recoup our cash balances for sums lent or to be lent to the municipalities of Calcutta and other places. These items amount in all to five millions, or 3½

Appendix, No. 3.

millions of new debt, one million renewal of former debt, and half a million of debentures at short currency, which will not add to the permanent debt. These are all subject to the approval of the Secretary of State. On the other hand, two millions have already been set down by the Secretary of State to be raised in England. We propose to raise in India half a million on long term debentures in renewal of existing obligations, and to issue debentures for short terms not exceeding one twelvemonth, of the nature of exchequer bills, up to half a million. By the latter issue we hope to provide for the temporary requirements of the cash balances without trenching on the resources of the Presidency banks. There remain two millions to be raised, regarding which we shall immediately solicit the instructions of the Secretary of State. In these various ways the amount of five millions above stated will be provided for. If we shall have to advance any additional sums to municipalities during the year, such amount will have to be raised by loan.

With these several arrangements (which are subject, of course, to the sanction of the Secretary of State) we shall probably close the coming year with a cash balance of $11\frac{1}{2}$ or nearly 12 millions, much the same as that with which we are closing the current year. These amounts indicate that our cash balances are not even yet restored to their proper proportions. By the experiment of issuing short term debentures, as above mentioned, we hope to work with a somewhat less cash balance than heretofore. If, as the year proceeds, the accounts shall be unfavourable, some additional temporary resource will have to be provided.

The last statement to be noticed is that of the cash balances in India. This statement includes not only all the regular receipts and disbursements in India, besides the remittances to England, but also all the "debt," or, as it might better be called, the "deposit." This technical debt has nothing to do with the public or national debt, but it arises in this way. In some respects our exchequer serves as a great bank of deposit; it receives and keeps the money belonging to the local funds, to the funds, pensionary and others, of the services, civil and military; to the Judicial Department, and to a variety of depositors. It serves as general banker to the railways and receives all their traffic earnings. It also acts as a banker for much of its own remittances. In these several ways there is made up a vast aggregate of many millions of deposit receipts shown on one side of the account, balanced by a corresponding amount of disbursements on the other. We shall commence the new year on the 1st April with a cash balance of close upon 12 millions; we hope, also, to end it with a sum of nearly 12 millions. On the receipt side of the statement there are upwards of 49 millions of revenue; three millions to be raised by loan; some 13 millions of deposit, of which latter the three millions of our local funds income forms a part. The above three millions of loan is exclusive of the two millions to be raised by the Secretary of State, which have been allowed for on the other side of the account. Then there are some $3\frac{1}{2}$ millions of other receipts, railway earnings, and the like. All these, together with the cash balance in hand, make up the grand total to 80 millions. This is balanced on the disbursement side by some 43 millions for service in India; by some 14 millions on account of debt and deposit, including some three millions expenditure from local funds, and some 11 millions of other payments, including those for the Secretary of State's bills; all which, together with the cash balances, make up a counter sum of 80 millions.

Thus, for the coming year 1869-70, the national balance sheet of British India, including all the transactions of its Exchequer, shows 80 millions on each side of the account, truly a high figure demonstrative of the calibre of our power in the East; and now, with the mention of this spirit-stirring fact, I shall conclude my exposition.

Such is the Budget for 1869-70. The main points of the exposition are:—

That the entire expenditure on the new barracks is included in ordinary expenditure, and charged against revenue;

That on the two years under review, 1867-68 and 1868-69, there has been an actual deficit in 1867-68 of 1,000,000 of income as compared with ordinary expenditure, following a deficit of $2\frac{1}{2}$ millions on the total expenditure the previous year 1866-67;

That for the year 1868-69 there is a deficit by regular estimate of 1,000,000;

That for the coming year 1869-70, after including barrack expenditure, there is estimated an equilibrium between income and ordinary expenditure sufficiently assured by a small surplus;

That a one-per-cent. income tax is proposed in substitution for the existing certificate tax;

That $3\frac{1}{2}$ millions are proposed to be expended in 1869-70 on extraordinary reproductive works to be provided for by loan;

That $3\frac{1}{2}$ millions are proposed to be raised by loan;

That 1,000,000 of public debt, half in England, half in India, falling due for repayment in 1869-70, must be renewed;

That half a million is to be raised by short-term debentures to supplement the cash balances;

That the total of loan proposed for the service of the year 1869-70 amounts to five millions.

The Government of India has aimed at a financial policy to be at once safe, just, and sound: safe as strictly bringing to account of ordinary expenditure all items properly so chargeable;

chargeable; just, as tending to apportion more and more equally the fiscal burden between rich and poor; sound, as guiding all proposals according either to known custom in India or to established principle in England.

The facts and figures of British Indian finance, hard and stern as they may be, do yet bear witness to an agriculture furnishing staples for the use of distant countries; a commerce multiplying itself in every cycle of years; a revenue branching out in various forms of development; an ordinary expenditure held in control, and expanding mainly for useful or beneficent purposes; an extraordinary expenditure, designed to bring State capital to bear on the material improvement of the country; a public credit strong enough to constitute a resource for every reasonable need. By their general effect they recall the sentiment of the historian, they excite thankfulness in all thoughtful minds, and "hope in the breasts of all patriots."

The motion was put, and agreed to.

The Honourable Sir *Richard Temple* having then applied to his Excellency the President to suspend the rules for the conduct of business,

The President declared the rules suspended.

The Honourable Sir *Richard Temple* then introduced the Bill.

POLICE SUPERANNUATION FUNDS BILL.

The Honourable Sir *Richard Temple* then introduced the Bill to Abolish the Police Superannuation Funds.

TRANSHIPMENT OF OPIUM FEE BILL.

The Honourable Sir *Richard Temple* then moved for leave to introduce a Bill for imposing a transshipment fee on opium.

The motion was put, and agreed to.

The Honourable Sir *Richard Temple* having applied to his Excellency the President to suspend the rules for the conduct of business,

The President declared the rules suspended.

The Honourable Sir *Richard Temple* then introduced the Bill.

LAND CUSTOMS BILL.

The Honourable Sir *Richard Temple* then moved for leave to introduce a Bill to make better provision for the collection of Land Customs on certain foreign frontiers of the Presidencies of Fort St. George and Bombay.

The motion was put, and agreed to.

CUSTOMS DUTIES BILL.

The Honourable Sir *Richard Temple* then moved for leave to introduce a Bill to amend the law relating to Customs Duties.

The motion was put and agreed to.

The Council adjourned till the 11th March 1869.

(signed) *Whitley Stokes*,
Secretary to the Council of the Governor General
for making Laws and Regulations.

Calcutta, 6 March 1869.

ABSTRACT of the PROCEEDINGS of the Council of the Governor-General of India, assembled for the purpose of making Laws and Regulations under the provisions of the Act of Parliament 24 & 25 Vict. c. 67.

The Council met at Government House on Saturday, the 2nd April 1870.

PRESENT:

His Excellency the Viceroy and Governor General of India, K. P., G. C. S. I. presiding.

His Excellency the Commander in Chief, K. C. B., G. C. S. I.

Major General the Honourable Sir H. M. Durand, C. B., K. C. S. I.

The Honourable John Strachey.

The Honourable Sir Richard Temple, K. C. S. I.

The Honourable J. Fitzjames Stephen, Q. C.

The Honourable Gordon S. Forbes.

The Honourable D. Cowie.

Colonel the Honourable R. Strachey, C. S. I.

The Honourable Francis Stuart Chapman.

The Honourable J. R. Bullen Smith.

The Honourable F. R. Cockerell.

FINANCIAL STATEMENT.

: INCOME TAX BILL.

The Honourable Sir Richard Temple, in moving for leave to introduce a Bill for imposing duties on Income and Profits, said:—My Lord, I have now to present the Budget for British India for the official year 1870-71, this being the 11th annual statement presented to the Legislative Council. During my absence from India for six months of the year 1869-70, the finances were administered by my honourable colleague Mr. John Strachey, and some of the measures which I shall hereafter have to mention were commenced or carried on by him. The ability and carefulness with which he conducted the administration are too well known to your Lordship and to the Council to require any further commendation from me.

On this, as on former occasions, my statement will be divided into three parts, namely, the actual account for the past year 1868-69; the regular estimate for the year just closed, 1869-70; and the budget estimate for the current year, 1870-71, now commencing.

Before adverting to the three divisions in the order above named, I must explain certain improvements now made for the first time in the mode of exhibiting the figures.

In the first place, I am about to show the account of the working of the State railway, and the account of the Government with the several guaranteed railway companies, in the same manner as all other parts of the public accounts, that is to say, the real receipts will be shown on the receipt side, and the full payments on the expenditure side. Hitherto, as the Council will remember, the plan followed has been a different one. For instead of showing the receipts on one side and the payments on the other, that is treating the account in the gross, we have shown nothing at all on the receipt side, and only the nett payment (after deduction of receipts) on the other side. This has been the meaning of the item which has hitherto appeared in our financial statements, under the designation of guaranteed railway interest, less nett traffic receipts. In my exposition of last year, I furnished a summary of the main facts from which that important item was derived, namely, the gross amount of interest payable by the State to the shareholders of the guaranteed companies, then the amount recovered by the State from the traffic receipts, and so on. Whether the Council was able to follow me through that explanation, I cannot say. But I felt at the time that it was hardly a satisfactory circumstance that so much had to be said to elucidate an item which ought not to need such elucidation at all, and which ought to be in its nature apparent from the face of the statement. Subsequently this consideration further forced itself upon me. The figures of all other departments are exhibited not in the nett but in the gross. No other heavy payment is shown in diminished proportions by reason of a set-off. If this were to be done generally, then the financial statements would lose half their clearness, and the publicity half its value; and the real nature of the income and expenditure would not be intelligible. Why then should an exception be made in the case of the railway expenditure, which has been for years a large and growing item in the charge side of our financial accounts? There is no good reason whatever for this. On the contrary the public has a clear interest in seeing this part shown in the same way as all other parts

Appendix, No. 3.

parts of the account. For the payments by Government of interest now approach the sum of 4½ millions sterling annually. How is the rapid accretion of this interest to be appreciated, if it is not shown in the annual statements? On the other hand, the set-off against this is the amount of nett traffic receipts, that is, the gross traffic receipts, less working expenses. This also is happily growing fast, and now exceeds 2½ millions sterling. But still it is, and will probably for some time remain, inadequate; in other words, it is, and will be less than the interest payments. But we hope that this may gradually approach nearer to the balance of the account; and it concerns every one to know how far this desirable approximation is or is not being attained. This depends on the development of railway traffic and the economy of working expenses. Indeed the working expenses now amount to nearly four millions sterling per annum, and constitute virtually a branch of public expenditure in which the public is as nearly concerned as in any other branch. These points are not only fraught with general interest, but also affect the ultimate financial result and the determination of surplus or deficit. I therefore propose to show the two great items each on its proper side of the account. This course too strictly accords with the terms of the contract between the State and the companies. After providing for the regular payment by Government to the companies of the five per cent. interest on the capital paid up, the contract goes on to say that "all moneys received by or on account of the Railway Company in India * * * shall be paid into the Treasury" of Government; that the "nett receipts, after deducting all sums * * * for the current expenses of working the railway" * * * "shall be applied in the first place towards the discharge of the interest payable" by the Government.

In the second place, as the Council will recollect, the practice has been to exhibit the expenditure in India in detail under the main heads or branches, and then to show the expenditure on account of India in England in the lump or aggregate. Nevertheless the expenditure in England was, for the most part, not divisible under any new or separate heads, but really pertained to the several branches of the administration in India. Still it was not divided nor classified in our financial statements. Its amount is very considerable, being almost 12,000,000 £, or more than 22 per cent. of our total expenditure. Though, of course, classified for official purposes, it has heretofore remained absolutely unclassified in our financial statements. One consequence has been this: that the expenditure shown separately in our regular financial statements has never represented the full and complete cost of many of our greatest departments, such as Army, Marine, Public Works, Interest, and others. That the arrangement is so far improvable seems to be beyond question. Last year I did present a supplementary statement calculated to meet the want. But this year I have prepared the statement with a combination of the figures derived from India and from England; so that they now display the full cost of each branch, whencesoever derived and wheresoever incurred. The formal and principal statement being thus comprehensively prepared, supplementary statements are added, showing how much is spent for each head in India and how much in England.

In the third place, the water rent paid by the landholders for the water obtained from the State canals has been transferred from the heading of public works income to the heading of land revenue. The amount is important, being more than 500,000 £, or half a million. The public works income properly includes only sale proceeds of old stores and other items technically called recoveries, with which canal-water rent has, of course, nothing to do; whereas this water rent is income derived by the State from its measures for improving the land by means of irrigation.

In the fourth place, the item of "Allowances to Village Officers" has been combined with the expenditure relating to land revenue, and is no longer shown in a separate heading; and for it has been substituted a heading, "Minor Departments," under which will be shown the charges of the trigonometrical, topographical, and geological surveys, and other departments not readily assignable to any other existing head.

In the fifth place, from the heading of "Education, Science, and Art," we have eliminated, as just explained, the cost of the Survey Department. The surveys, though scientifically conducted, are executed in but a small degree for purposes of science and almost entirely for fiscal, engineering, and other practical purposes. On the other hand, it is of consequence to all those who are interested in the moral and intellectual progress of India that the true charge for education should be shown on the face of the statement. Heretofore the precise progress of this important item has not been perceptible from the statement; and never could be so, while other and foreign charges were mixed up with it. On this occasion, then, the figures which I exhibit are those for education alone.

In the sixth place, the abstract, which the Council will remember having seen on former occasions, under the title of "Statement of Estimated Cash Balances," has been superseded by an improved cash statement, exhibiting an abstract of the entire financial transactions of British India, and showing, in a clear form, how, for each year, the total disbursements of all kinds are actually met, or, in other words, how the ways and means of each year are provided.

So much, then, for the improvements in the form of the statements, and I must ask the Council to remember, that by reason of these improvements, the figures I now give will not be comparable, in detail, with those I gave last year, though the ultimate result will be duly comparable.

After this preface (the length of which will be excused from regard to the importance of the topics), I proceed to the actual account of the past year, 1868-1869.

The receipts were 51,657,658 £, or more than 51½ millions sterling. The ordinary expenditure

expenditure amounted to 54,431,688 *l.*, or near 54½ millions, causing a deficit of 2,774,030 *l.*, *Appendix, No. 8.* or 2½ millions of receipts, as compared with ordinary expenditure.

In my last financial exposition I explained that there would be a deficit in that year of income as compared with ordinary expenditure. The deficit was then estimated at 970,471 *l.*, or one million. That estimate was necessarily incomplete, being based on eight months' actuals and four months' estimate; the last four months, too, constituting the most important and critical part of the year. Still, the difference between the estimate and the result is very considerable; and I must, as briefly as possible, recapitulate the reasons.

These reasons have arisen in small part only from shortcomings of receipts on the whole. Exclusive of the railway earnings, the receipts in India indeed were 49,077,007 *l.* actual, against 49,288,700 *l.* of the regular estimate, the difference less being 218,158 *l.*, or one-fourth of a million. I attribute this to the fact of the yield of the Malwa or Bombay opium having been over-estimated by us. The amount indeed taken was fair enough as compared with the actuals of the two preceding years; but the last four months of the year proved abnormally unproductive, and these were the months which did not come within the regular estimate.

The difference, then, between the estimated and the actual deficit was caused mainly by excess of expenditure. In the first place, an item of 505,922 *l.* is brought about by charging in the accounts the liabilities of the Government in respect to the late military and medical funds, which existed chiefly for the benefit of the widows of deceased officers. The arrangements made on the transfer of the fund provided that assets should be gradually year by year appropriated by the Government, which was, on the other hand, to pay all the pensions and allowances. The transfer occurred during 1867-68. It commenced in that year, and came into full operation during the year under consideration, 1868-69. At the outset, these pensions disbursed in England by the Secretary of State were not charged in the English expenditure, but were held by the Secretary of State in a suspense account, that is, in the account current between England and India, and were so held at the time when my last financial statement was made. But inasmuch as the Secretary of State has ruled that the pensions are to be included in the expenditure in England, and as they now constitute a real charge against the revenues, we have deemed it best to include them (subject to the sanction of the Secretary of State) in the English expenditure once for all; and to finally adjust the account. The amount thus to be charged comes, as above stated, to 717,734 *l.* of which two-thirds relate to the year 1868-69, and the rest to the previous year, 1867-68. Of this sum, 211,812 *l.* had already been provided for, being charged in the Madras accounts. The remainder, or 505,922 *l.*, has now been added, and the whole charged in the English accounts.

Another cause was an excess of 492,004 *l.* on the expenditure on Public Works Ordinary. This arose partly on works emergently undertaken in districts suffering from drought or famine. Owing to certain defects in the control of the Public Works Department, some portions of the grants for extraordinary works were made use of for the ordinary works, and the circumstance was not known to the department when it rendered its estimate to me at the time of my last financial statement. The occurrence of this excess, and the fact of its not being known in time, undoubtedly indicated, as I have above stated, defects in financial control. Those defects have now been carefully searched out, and remedies are being applied which will, we hope, prove effectual for prevention in future. Their efficacy will be tested by experience.

Then there was an excess of 186,346 *l.* in the Army expenditure, arising partly from the high prices of provisions in drought-stricken districts, and partly from field operations on the frontier. There was a net excess expenditure again in the civil departments, chiefly in Marine, Interest, and Miscellaneous, amounting in all to 350,541 *l.*

These several items, together with a few others with which I cannot detain the Council, account for the difference between the estimated deficit of one million and the actual deficit of 2½ millions.

Besides the ordinary expenditure above alluded to, there was during the year an extraordinary expenditure of 1,370,613 *l.*, or 1½ millions devoted in nearly equal proportions to irrigation, to Bombay special fund works, and to the purchase of the State Railway in South Eastern Bengal.

Thus, the past year 1868-69 ends with a deficit of 2½ millions, and this circumstance suggests the following observation. The Council will remember that, in my last financial statement, I put the deficits of the three years, 1866-67, 1867-68, and 1868-69, at 4½ millions. This was on the supposition that the deficit of 1868-69 would be one million, whereas it is now seen to be 2½ millions. Thus the 4½ comes up to 6½ millions. I then showed that there had been an expenditure of 3½ millions on new barracks, which had been undertaken partly in the belief that they would not be treated as ordinary works, and would be excluded from the ordinary account. From that point of view the new barracks would have mainly accounted for the deficit. But now this can no longer be said. The deficits being 6½ millions, of which only 3½ can be accounted for by the barracks, and are susceptible of special justification, it must be admitted that the remainder, 2½ millions, are due to excess of expenditure accepted as chargeable against current income, and represent deficit pure and simple without such special justification.

So much then, in brief, for the actual account of the year that is passed, 1868-69. I now have to advert to the year just expired, 1869-70, the figures for which are derived chiefly from actual accounts and partly from estimates.

For 1869-70, then, the receipts are taken at 52,942,482 *l.*, or 53 millions, which amount

Appendix, No. 3. exceeds by 699,542 *l.* or three-fourths of a million, the sum of 52,242,940 *l.* or 52½ millions estimated in my financial statement of March 1869. The Council will remember that these figures will not admit of simple comparison with that statement by reason of the inclusion of the nett railway traffic receipts and of the receipts in England.

This increase of receipts has arisen notwithstanding failure of the customs and the opium to yield the amount estimated in the budget. The customs revenue was taken at 2,773,500 *l.*; it is now expected to yield only 2,416,500 *l.*, showing a difference less of 357,000 *l.*, or about one-third of a million. The opium revenue was taken at 8,286,540 *l.*; it is now expected to yield only 7,953,800 *l.*, showing a difference less of 332,740 *l.*, or one-third of a million. This falling off of opium revenue has occurred entirely in Bengal, where the price per chest was estimated at 1,330 rupees, or 133 *l.*, while only an average of 1,199 rupees or 120 *l.*, has been realised. In the Madras and Bombay Presidencies, the rate of duty on salt has been raised from Rs. 1. 8. 0. per maund to Rs. 1. 13. 0. for the latter half of the year. Had it not been for this additional duty, the deficiency in the salt revenue would have been considerable. On the whole, it may be said that the salt estimate has been just maintained and no more. There have been also other items of deficiencies, which, together with the above two main items, bring up the gross deficiency of regular estimate below budget estimate to 899,222 *l.*, or nearly one million.

The Council will then ask how, despite of this deficiency, is a nett result of increase on the whole arrived at? Well, it is arrived at as follows. There is an increase of 461,778 *l.*, or nearly half a million in land revenue. This is caused partly by the adjustment in account of the accumulated proceeds of the sale of waste lands, the Government promissory notes in which these funds were invested having been cancelled, and debt to that extent having been reduced. Also in the Punjab and notably in the Madras Presidency, the collections of the revenue have proved more favourable than was expected. There is an increase of 71,943 *l.* in tributes; this arises from the partial capitalisation of the political contributions payable by his highness the Maharaja Holkar. The increase of 151,600 *l.* under the head of assessed taxes is entirely produced by the additional one per cent. income tax imposed for the latter half of the year, without which there would have been a deficiency. The yield of the additional duty is estimated at 350,000 *l.* There is taken an increase of 448,472 *l.* under the head of miscellaneous; this arises chiefly from adjustment of accounts consequent on the arrangements regarding the police superannuation fund and the transfer to Government of the Bombay Medical fund. The army receipts show an increase of 181,760 *l.* These main items, together with some lesser items, bring up the total increase to 1,598,764 *l.*, or over 1½ million. And thus on the whole the receipts of the year are now taken at an increase over the budget.

On the other hand, the ordinary expenditure in 1869-70 was estimated in the budget at 52,190,290 *l.*, or nearly 52½ millions; it is now expected to rise to 53,568,076 *l.* or upwards of 53½ millions, showing a difference more of 1,377,786 *l.*, or 1½ million.

This excess has occurred notwithstanding that the expenditure on public works ordinary has been reduced to 5,040,395 *l.*, instead of 5,834,160 *l.* provided in the budget, showing a reduction of 793,765 *l.*, or three-fourths of a million. There have been also various savings, such as 33,938 *l.* in the Post Office, 47,673 *l.* in the Electric Telegraph, 39,300 *l.* in education, which, together with other items, bring up the total decrease of charges to 1,107,131 *l.* or over one million.

Here again the Council will ask, how comes it that, despite these reductions, the total charges and expenditure show an increase on the whole? The answer is that in several departments there have been increases over the budget estimate, some of which I must now explain.

In the two items of interest on public debt and on other accounts, there are increases of 73,516 *l.* and 124,925 *l.* This has arisen from the proportion of unclaimed dividends having been less than was expected; from the charging to our accounts of certain interest payments on account of the expedition to Abyssinia, which amount we had hoped to recover from Her Majesty's Government; and from the raising in India of a loan of two and a half millions for public works extraordinary. When the budget was framed, we believed it most probable that this public works loan would be raised in England, and during the latter half of the year, in which case instalments of interest would not fall within this year. Subsequently we received the Secretary of State's sanction to raise the amount in India, and we preferred to bring the loan out at an early period: consequently the payment of interest has fallen within this year.

The increase on forests of 35,084 *l.* leads to more than corresponding increase of revenue. The same remark applies to the increase of 123,870 *l.* in the payments for opium. This arises from the yield of the opium crop being better than was anticipated when my budget was framed, and consequently greater quantities of the drug being brought to the storehouses. Under the contracts with the cultivators, the quantity brought by them must be paid for. Such payments in a fiscal point of view are not, indeed, to be regretted, as they conduce, on the other hand, to enhancement of revenue.

The Police charge was estimated at 2,374,200 *l.*, and has now risen to 2,440,900 *l.*, showing an increase of 66,610 *l.* This difference, which would have been larger but for counteracting economies, has been caused by the delay in carrying out the abolition of the Police superannuation fund. The delay has arisen (notwithstanding this Council having passed the requisite law) from the difficulty of arranging the details with the several local Governments. The excess charge caused by the delay is neutralised by the consequent increase in the assets credited under Miscellaneous.

There is an increase of 381,882 *l.* in Marine. This partly arises from our having charged off

off finally as expenditure the sum of advances on account of the Mutla or Port Canning Port Fund, which it is prudent to treat as irrecoverable; and from our proposing, after protracted inquiry, to remit a portion of a long outstanding debt due by the Calcutta Port Fund to the Government. In this heading, too, is included a sum of 45,000 £. as a contribution by the Government of India towards the cost of the naval force which Her Majesty's Government is to maintain in the East Indian waters. This is a new charge, entered under instructions from the Secretary of State. It was hardly possible to provide for these in the original estimate, as there was no information at that time as to whether these charges would accrue at all, or in what year they would fall.

The increase of 448,728 £. in Miscellaneous is mainly due to difference between the actual and the estimate of the loss by exchange on Secretary of State's bills and to the charge for the freight of stores from England. The charges of the Political department have increased by 152,290 £. This increase arises from the payments and presents made to the Amir of Cabul, which were inadvertently omitted from the estimate.

The increase of 303,972 £. in superannuation allowances arises from the adjusting of the accounts of the Military Fund already explained. When the budget was framed, the amount of these pensions (396,292 £.) was entered by the Secretary of State in his remittance account, and not (except the Madras portion (120,000 £.), which was entered in the estimates in India) included in the charges. But we have deemed it necessary (subject to the sanction of the Secretary of State) to take the remainder, 276,792 £., out of the English remittance account, and to charge the whole in the regular expenditure in England.

There is an increase of 422,831 £. in the army charges, of which 292,831 £. accrued in England for stores, furlough allowances, and pensions, and the rest in India, from the high prices of food and a variety of lesser causes which it would be tedious to detail.

These items, together with some others, for which I need not stop, bring up the total increase to 2,484,917 £., or two and a half millions.

I have now stated the causes of all the variations in estimate on both sides of the account. That the amount of these variations should be so large is matter for regret. One main cause is traceable to the difficulty of adjusting the accounts under a necessarily complex system dealing with a great variety of interests. And if it be difficult to adjust these accounts with certainty, how much more difficult is it to estimate beforehand what form the adjustment will ultimately take, and what its precise result will be. This year's special efforts have been made to clear off all old accounts, and to have the books as unencumbered as possible for future years. The subject has my unceasing attention.

The items of expenditure as above specified are taken from the combined figures, Indian and English. It may be interesting, however, to the Council to note exactly what has been the increase on the English figures taken separately under the old heading of "net expenditure in England, including stores." The amount then for this total set down in the budget, as taken from the Secretary of State's estimate, stood at 10,996,950 £., it is now expected to stand at 11,868,869 £., showing an increase of 872,119 £. This has arisen partly, as already explained, from the Military Fund payments (396,292 £.) not having been included in the estimates of charge, partly from the cost of stores for the different departments in India, and partly from the increased allowances payable under the new rules to civil and military officers.

This particular part of the expenditure is, as the Council knows, under the control of the Secretary of State, and so far no remark is required from me. I should say, however, that as regards the "stores," the Secretary of State only acts on behalf of the Government of India, like an agent, if the expression may be allowed. The stores are ordered by the India Office in London on indents received from the Government of India; and the Secretary of State's estimate is framed in reference to those indents. It sometimes happens that emergent indents are sent home from India within the year, and these must, *pro tanto*, disturb the estimate, and for that much of disturbance the Government of India is solely answerable. Such has been the case this year in reference to a portion of the stores. I must add that heretofore the financial control in India over the indents sent hence for stores from England has been defective, and measures are being adopted to render it more efficient in future.

Thus much on the details of the receipts and expenditure. In the budget it was estimated that there would be an equilibrium with a small surplus of 52,000 £. But the receipts being now expected to stand at 52,942,482 £. or nearly 53 millions, and the expenditure at 53,568,076 £., or more than 53½ millions, there is anticipated a deficit of 625,594 £. or more than half a million of receipts below ordinary expenditure.

Besides the above ordinary expenditure, there has been an expenditure extraordinary of 2,016,743 £., or upwards of 2½ millions, on reproductive public works during the year, such as irrigation, State railways, and on Bombay special fund works.

Instead of an estimated equilibrium, then, the year has ended with a deficit of a considerable amount. In some respects, the adjustment of accounts has improved the figures on the receipt side; while in some respects it has made the figures worse on the expenditure side. If there are windfalls on the one side, there are unexpected drawbacks on the other. Also some share in the responsibility rests with the home authorities. But after allowing for all these considerations, I must fully acknowledge a deficit, for which we are clearly responsible, and regarding which I desire to offer the following observations.

As already seen, we suffered a heavy disappointment in respect to our estimate of the opium revenue on the Bengal side. This arose from a fall in the market price, which fall again is believed to have been caused mainly by the extension of opium cultivation in

Appendix, No. 3. China itself. We were indeed aware that such cultivation was being in some degree extended, but there was no information at that time to lead to the apprehension that this extension would spread so much as it now appears to be spreading. The further information since obtained of the extension was not then available. For two years and more previous to the framing of the estimate, the prices had ranged at very high rates which indeed were well sustained up to the eve of the budget being produced. There was no known fact to warrant the rate being taken lower than what was then actually ruling. Still on general and prudential considerations, we took the price at an average of the realisations of the past three years, which brought out a rate less by 50 rupees, or 5 £ a chest less than what we were then receiving. This estimate has indeed partially failed by reason of events in the interior of a remote, half civilized, and comparatively unknown country like China, the nature of which circumstances is even now but vaguely ascertainable by us.

Then the Customs duties have fallen not only below the budget estimate, but also below the actual realisations of the two preceding years. There has been, as the Council knows, a depression of trade not only in India but in many other countries; and this has mainly caused the falling off in our Customs. But when the budget was produced, there was not a single fact to indicate that such a depression was about to set in. Up to that date the Customs revenue had been increasing yearly for several years; that very year they both increased as was proved by the latest statistics and fiscal returns. The authoritative commercial reports up to date, though noticing fluctuations, and not in all respects sanguine, were yet on the whole favourable and hopeful. There had indeed been drought in some parts of India, but that had not up to date affected trade or Customs, and the prospects of the season had recently improved. There had also been some modifications in the valuations of the tariff in favour of the merchants, but this was allowed for in the estimate.

From the several financial statements made in this Chamber, the Council knows how constant has been the increase in the State income of India. However, not even that normal increase was estimated for. The revenue was estimated at just the sum which had been received in the preceding year, and no more. A slight increase only was taken on account of additional taxation. Does not this look *prima facie* as if the estimate was moderate?

These causes (which were, as I contend, misfortunes hardly to be foreseen), together with lesser circumstances with which I need not now trouble the Council, threatened the Government of India with the prospect of a serious deficit. How has this prospect been met? Why, by increasing resources, that is, by additional income tax, and additional salt duty, on the one hand, and by reducing public works ordinary expenditure on the other. Moreover there have been numerous savings and retrenchments carried out in all the provinces of India (for which the general finance is much indebted to the cordial exertions of the several local Governments), which it would be tedious to specify, but of which the total effect is estimated at 200,000 £. The condition of the year's finance has been bettered by the above measures to the extent of 530,000 £ on the receipt side, and 993,765 £ on the expenditure side, the total improvement being represented by 1,523,765 £ or 1½ million.

When introducing into this Council in November last the Bills for extra taxation, I stated that every "effort would be made to destroy the remaining deficit, to run it hard, to break its back, so to speak." This promise related of course to receipts and expenditure in India. The figures show that it is in a fair way of being fulfilled.

These last figures, however, are not altogether actuals, but belong to the regular estimate. In India these regular estimates have sometimes been so far falsified by results as to have acquired an ominous significance. On previous occasions the practice has been to frame these regular estimates on eight months' actuals and four months' estimates. In some respects the actuals did not extend to eight months, but only to seven or even to six. This method left a large margin for uncertainty, for the four months of estimate were, as I have explained once to-day, about the four most important in the year, and the very ones when the financial transactions were the largest. The regular estimate which I now present, however, ought to be of a better kind, for it is based on eleven months' actuals for nearly all the receipts and for all civil expenditure in India and 10 months for army, marine, and public works; leaving only one month, or in some cases two months, for estimate, which estimate is based again on the actuals of the last months of former years. But even for the last month we have obtained actual data for some important branches on the receipt side especially.

Another cause of the uncertainty in the regular estimates has been the adjustment of many items in the twelfth month. And this cause may perhaps to some extent operate to throw out parts even of the regular estimate I now present. We have striven to ensure these adjustments being made more and more regularly month by month; so that the pressure may cease to be thrown on the close of the year.

Still after allowance shall have been made for all that can fairly be said in defence of our estimates and accounts, the recurrence of deficits in time of peace, and the discrepancies between estimates and results which have so frequently happened, do compel us to search for and remedy whatever defects there may be in our system. Despite the many improvements that have been effected, the result proves that some defects must still remain. Two main defects I have above indicated—one of which was vital, certainly. They have been, as we hope for the most part, remedied. We shall strive to make the remedy more and more complete after each year's experience.

Over and above these, however, there doubtless are lesser defects. Addressing this Council

Council in November last, I said "We must examine more thoroughly than heretofore the monthly statements of actual receipts * * * We have such an examination now; but we must have it more strictly in future; we must check our financial conclusions more immediately by actuals up to the latest day; we must base our estimates more strictly on the actual results up to date, and less on general conclusions."

I need hardly add that we are acting, and shall act more and more closely on these views.

Having thus dealt with the years 1868-69 and 1869-70, I arrive at the third and most important part of my exposition, namely, the Budget estimate for 1870-71.

The receipts are taken at 52,327,755 *l.*, or 52½ millions, to be compared with the 52,942,482 *l.* or 53 millions estimate for the year just closing, 1869-70.

The land revenue estimate is an aggregate of the estimates received from the local Governments, which have not been materially departed from in any case. There is a decrease of 513,646 *l.* as compared with the previous year, of which the return was swollen by the inclusion of the waste land receipts and the collection of some arrears. The effects of the drought of 1868-69 have been felt throughout 1869-70. The stocks of grain in some parts of the country are believed to have become exhausted. The rains of last season, though somewhat delayed, were ultimately abundant. In many provinces the harvests have been good. In some districts, however, there are still fears. On the whole, the advent of the ensuing rains must be looked for with some anxiety.

The decrease of 28,070 *l.* under tributes arises from the capitalization of the Holkar tributes in 1869-70 already alluded to.

The forest revenue shows a continued increase, more than balanced, however, by increased cost on the expenditure side.

Under Excise we venture to expect a small increase of 39,300 *l.*

The item of assessed taxes I shall reserve for further mention hereafter.

For the Customs we have only taken 2,416,500 *l.*, being the same amount as that which we have received in the year just expired, during which so much commercial depression has prevailed. That the present yield should not be greater than it is, must be regarded as an unfavourable indication respecting the condition of the people of India. In some places the inhabitants are impoverished by the late drought, or are still apprehensive about their crops; and are unwilling to buy European clothes or other things comparatively luxuries, until they are sure of their food; all which circumstances cause the up-country markets to continue slack. Still in most parts of India the people are advancing in prosperity as much as ever; and regard being had to this consideration, a revival of trade might be hoped for. Again, there have been fluctuations in the trade: January, a very important month, turned out badly; but February was better. March, the month just over, has been a little more favourable. On the other hand, the reports issued by the Calcutta Chamber of Commerce have been, and still are, unfavourable, and the opening of the Suez Canal has caused some forestalment of imports, and consequently of duty. I trust that things will not become worse than they are, and that we shall receive at least as much in the year 1870-1 as we have received in 1869-70, but I know no fact which would justify me in raising the estimate.

We have carefully considered the expediency of reducing or remitting the export duty on rice exported from India and from Burmah. This branch of trade was for some months much depressed, but has of late shown signs of improvement. The depression, however, arose, as we believe, from other causes besides the duties. The prices of produce are rising rather than falling. The demands in China and Japan seem likely to become more brisk; indeed, scarcity is understood to prevail in some parts of Japan. Though fully sensible of the objections which can be urged against these duties, yet looking to the circumstances of the case and to the financial exigencies of the time, we have decided not to propose any change in the duties at present.

We propose to remit the export duty on shawls and on a few insignificant articles; and on the other hand to include some others in the tariff, and to levy the duty on galvanised iron *ad valorem*. These modifications are not expected to cause any loss of revenue. The shawl duties have operated as virtually transit dues on the shawls from Cashmere, and as regards the British Indian shawls, it is well that they should not be weighted in their competition with the shawls of other countries.

In my last statement I alluded to the progressive increase in the foreign trade of British India, and I stated that the sum total of value had risen from 95 millions in 1866-67 to 101 millions in 1867-68. Since then the ascertained trade of 1868-69 has amounted to 106 millions in value. But after some years of satisfactory progression, the year 1869-70 is almost certain to prove one of retrogression. We now possess the complete returns for nine months of that year, and they show a decrease of 8 per cent. in value and 5 per cent. in quantity as compared with the corresponding period of the preceding year. That the comparison as regards value should be less favourable than that as regards quantity is accounted for by the fact that there has been a reduction of the valuations by tariff. Still there is a falling off of 5 per cent. on the whole; and this is specially perceptible in some important staples of import, such as piece goods and metals, and of exports, such as cotton, rice, and indigo. One important item of export, namely jute (fibres) has kept its place as well as ever. The cotton export of 1868-69 amounted to 700,000,000 lbs., or 1½ millions of bales; but the quantity for 1869-70 will prove considerably less. In 1868-69 there were 11½ millions of pounds of tea exported; the quantity for 1869-70 seems likely to prove as great. In 1868-69 there were 48 millions of pounds of coffee exported; the quantity for 1869-70 will certainly prove less. The causes of the depression of trade must doubtless be sought for

Appendix, No. 3. in other countries besides India. But they have been aggravated by the drought and distress which have prevailed in some parts of India itself.

The salt revenue has been taken at 6,177,370 *L.*, an amount considerably over that of the previous year, chiefly because the increased duty in Madras and Bombay (6 annas per maund) is to operate for the whole of 1870-71, whereas it operated for only half of 1869-70.

For the opium revenue we have taken 6,922,281 *L.*, of which 4,905,281 *L.* pertain to Bengal and 2,017,000 *L.* to Bombay. The Bengal estimate has been taken at 975 rupees or 97 *l.* 10 *s.* per chest on 49,000 chests. For the first three quarters of the year, the provision is, with the exception of a small deficiency of 1,104 chests, actually in store. For the last quarter, from the information given by the local government, we trust that the number of chests is tolerably certain. To provide it we ought to sell 52,000 chests in 1871, a supply which we hope to be in a position to bring forward, but which is certainly not likely to be much exceeded. The real doubt is as to the price per chest, the calculation of which solely depends on forecast. The price, as the Council know, averaged 1,379 rupees, or 137 *l.* 18 *s.* per chest, in 1868-69. In 1869-70 it has averaged 1,109 rupees or 110 *l.* 18 *s.* It has fallen with an unfortunate regularity from 1,324 rupees or 132 *l.* 8 *s.*, at the beginning of the year, to 1,093 rupees or 109 *l.* 6 *s.* at the close. So far as we can judge from China advices and from local prices, the tendency is downwards. The Government of India possesses now a mass of information, which, though not always clear, does in the main show that the cultivation of the drug is increasing, and is likely to increase further, in China itself. So far as opinion goes, nearly all authorities believe that the opium trade of India with China will be subjected to a degree of competition not heretofore experienced. Taking all these things together, I anticipate the possibility of a further fall in prices, and have considered the rates to which prices have fallen within recent experience. They have gone as low as 900 and 850 rupees a chest. Though hoping that they will not again fall so low, yet I consider that no estimate of a higher average than 975 rupees or 97 *l.* 10 *s.* a chest would be safe; and a reasonably safe estimate we must have. So also with the Malwa opium, having regard to the manifold fluctuations of the Bombay market from year to year, even from month to month; and to the probability of its sympathising with any fall on the Bengal side, I do not consider that any estimate much over 2 millions would be safe. We are, indeed, receiving 2½ millions (2,357,000 *L.*) for the year just closed, which quite fulfils the estimate. But then we only received 1,800,000 *L.* in the preceding year, when circumstances were more favourable than this. The estimate of the current year, though realised at last, has been a constant source of anxiety. The present crop is reported to have been seriously injured by unfavourable weather. Judging by all known circumstances, I should fear that a falling off may shortly be looked for. So recently as November last, we were confidently assured by the authorities at Indore that we should not realise even two millions in the year just closed.

On the whole, it will be seen that our opium estimate stands at 6,922,281 *L.*, or 6½ millions, being less by 1,031,159 *L.*, or one million, than the receipts of the previous year; while our expenditure is expected to rise by 164,910 *L.* making a total deterioration under this head of 1,196,069 *L.*

It will be observed that a decrease of 1,604,600 *L.*, or 1½ millions under stamps, is balanced by an increase of 1,692,700 *L.* under law and justice. This represents the transfer of the receipts of judicial stamps (now levied under the new Court Fees Act) from the one head to the other.

The large decrease of 677,298, or ¾ million, under the head of miscellaneous, arises from the fact of there having been extraordinary receipts, commonly known as "windfalls," in 1869-70, which are not expected to recur.

The railway receipts net are taken at 3,125,258 *L.* at an increase of 211,084 *L.* over the year just passed, that is 6,705,058 *L.* gross earnings, less 3,609,800 *L.* working expenses, the traffic being represented by seven millions of tons and 15 millions passenger journeys; and all this on 4,840 miles of open line. These are high figures; if realised, they will indicate a satisfactory progress of railway traffic; they are tendered by the Public Works Department. Seeing that some 600 miles of new line are to be opened in the year, increase of traffic may be looked for; but then there will be an increase of working expenses. On the whole, this item must be regarded as necessarily uncertain, as being dependent on traffic, the growth of which we cannot exactly foresee.

I now turn to the expenditure side, and shall notice together, firstly, the items of the increase; and, secondly, the items of decrease.

There is an increase of 270,032 *L.* in interest. This increase is due to our having to pay a full year's interest on the loans of 1869-70, on which only half a year's interest fell to be paid in that year; to a large amount of interest properly pertaining to 1869-70 being thrown forward to 1870-71, owing to the late arrival of the last English mail, and to a new loan to be raised this year, the particulars of which I shall explain presently.

There is an increase of 117,606 for forests, which is almost met by the corresponding increase of revenue. Also there is, as already stated, an increase of 164,910 *L.* in opium, owing to extension of cultivation, and of 27,944 *L.* in excise for the purchase of opium for home consumption; these items also tend directly to increase of revenue. Similar remarks apply to the increase of 103,299 *L.* in salt, attributable chiefly to the arrangements for the manufacture of alimentary salt at the Sambhur lake in Rajpootana, and in various parts of North West Provinces, and of Oude, all which measures are connected with fiscal improvement.

The increase of 178,698 £, in law and justice is due chiefly to the transfer of discount from stamps, the revenue from which is now to be credited as law and justice receipts, and to the charges for the service of processes, which, with the corresponding receipts, are now entered in the Imperial accounts.

The increase of 66,498 £, in education will not be regretted.

The increase, 126,681 £, in superannuation allowances, is due to the reductions in the police (which involve gratuity payments) and to the anticipated operation of the rule for the compulsory retirement of public servants at the age of 55 years.

There are small increases under several civil departments, such as land revenue, ecclesiastical, medical services. These are inevitable, as they are brought about by the progressive scale of salaries so frequently allowed of late. In recent years it has been thought more economical to sanction gradual progress towards a maximum than to allow the maximum at once. Of course, this practice, however good in itself, does at first cause the expenditure to rise slightly from one year to another. The increase in law and justice arises partly from a transfer of charge from the head of stamps, which department shows a corresponding decrease.

An increase will be observed of 56,181 £, for the electric telegraph department, not counter-balanced by any increase of receipts from this source. This arises chiefly from stores not having been sent out from England during the current year, so that an extra supply must be paid for in 1870-71.

The increase of 275,268 £ in railway charges relates chiefly to interest, and is due to more capital being raised in England for the prosecution of the works.

The increases of all kinds amount to 1,496,219 £, or 1½ million, apparently a large sum. But the above analysis shows that 678,964 £, the aggregate of the increase under forests, excise, assessed taxes, salt, opium, and railways, is absolutely necessary to be laid out in order to bring in a more than corresponding return of revenue. Again, 452,894 £, the aggregate of the increase, under interest, telegraph, and superannuation allowances, is inevitable, and under existing rules is not preventible by any action we could take. Thus the sum of 1,131,858 £, or nearly three-fourths of the total increase, is demonstrably indispensable. To this category the increase for education forms, of course, a special exception.

On the other hand, among the decreases of expenditure, there is the item of 129,633 £, under interest on service and other accounts; this arises from cessation of payments on the police superannuation and medical funds, and to the Presidency banks for temporary advances.

There is a decrease of 120,936 £ in the police department, of which, however, a part is owing to the reduction of pay from gross to nett upon the abolition of the superannuation fund, the rest being due to reduction of establishments. The decrease of 481,009 £ in the marine department is mainly owing to the large adjustment in 1869-70 of irrecoverable advances. Here also is included a sum of 70,000 £ as the contribution of the Government of India towards the maintenance of naval squadron to be kept up by the Admiralty in the Indian seas, as already explained.

In the army charges, there is an important reduction of 731,551 £, or ¾ million; the total being lowered from 16,476,892 £ to 15,745,341 £; this is partly nominal, the expenditure in England in 1869-70 having been in some respects abnormal. But about two-thirds are real, brought about chiefly by the reductions in the general staff in India, and in the European cavalry and infantry, as sanctioned by Her Majesty's Government, after some correspondence with the Government of India. We have been only able to take a very small decrease on account of the reductions in the artillery and the Native army, regarding which the recommendations of the Government of India are under the consideration of Her Majesty's Government in England. After setting off the diminished recoveries which we expect, the net estimated saving in the army is 554,016 £, or half a million, the net expenditure for the army being estimated at 15,000,116 £, or just 15 millions, a lower sum than has been paid in any year since 1863-64.

The grant for public works ordinary exhibits a reduction of 1,041,995 £, or more than a million; the amount for 1870-71 being 3,998,400 £ against 5,040,395 £ in 1869-70, and 5,834,160 £ in 1868-69. Thus in the course of a year we have lowered our grant by 1,835,760 £, or more than 1½ millions, or 31½ per cent. on a total of about six millions. The necessity for such reduction, which must of course retard the completion of many useful works, is much to be regretted. But financial exigency is imperative.

I should add that out of the above grant of four millions, 658,955 £, or more than half a million, represents the expenditure on the new barracks for the European troops.

The total of these decreases amounts to 2,883,669 £, or nearly three millions. This for the most represents real reductions of establishment or of works; and by it may be measured, to some extent, the efforts made by the Government of India to meet the financial exigency of the time.

The Council, remembering that retrenchments made on paper have sometimes failed to be carried out, and that reductions in estimate are sometimes found to be not realised in actual accounts, may ask me how I can affirm that the above large amount of reduction will really be effected? To this I should answer, that the largest part of the reduction, that relating to public works, is so far certain in that the disbursements depend solely upon the grants. No more than what has been granted will be disbursed, and the orders in detail regarding the grants have been sent already to the several local governments. So with the army reductions; those which I have allowed for have actually been sanctioned by the

Appendix, No. 3. Secretary of State, and the orders have gone to the proper authorities; some have even been carried out; for instance, two cavalry regiments have actually embarked for England. Some further reductions are almost certain, but we have ventured to allow for them only the sum of 70,000 £. So with the interest reduction, the charges in question have actually ceased. Again, as regards the police reduction, a part of it is quite certain, nothing more being needed than orders to the audit department; and to the rest of that reduction the local governments have actually signified their agreement.

The increases being balanced against decreases, the result is an expenditure of 52,164,315 £, or 52½ millions, against 53,568,076 £, or more than 53½ millions, of the preceding year, with a net reduction of 1,403,761 £, or nearly 1½ million of expenditure.

In framing the estimate I have not forgotten that there are certain pecuniary claims on the part of his Highness the Nāwab Nāzim of Benāal, still pending. I cannot at all foresee whether they will be found sustainable. We have decided that we are not justified in making any budget provision in this year on this account.

After this analysis of the receipts and expenditure of the current year now commencing, I must ask the Council to revert to the heading of assessed taxes, which I reserved for separate consideration. We have taken for this the sum of 2,180,000 £, or nearly 2½ millions sterling. The additional rate of one per cent. levied by Act XXIII. of 1869, in order to bring the one per cent. rate up to two per cent., expired on the 31st of March. As the law stands, then, at this moment, the one per cent. is all that is leviable. According to the experience of the year just over, 1869-70, the yield of one per cent. would amount to 700,000 £. Now, if we were to take that amount only, instead of the 2,180,000 £ now taken, there would be a difference less of receipts to the extent of 1,480,000 £, or 1½ million, and this difference would cause a deficit on income below ordinary expenditure of 1,316,560 £, or 1½ million. As the Council so well knows, we could not at this time appear before the public with a deficit in our budget. At least we could not adopt such an alternative while any legitimate or reasonable resource remained to us.

My exposition of the estimate of the receipts will have proved to the Council that the revenues generally are flourishing, though not quite so prosperous as they sometimes are. But in one important item, opium, there is a serious falling off, mainly owing to events and circumstances in China.

I have shown to-day what large reductions of expenditure have been effected, always with hard effort, and sometimes with much sacrifice. Then I have shown how inevitable are most of the increases of expenditure. Still, after reckoning the sum of these as a set-off, the net result is a decrease on the whole of nearly 1½ million (1,403,761 £) of expenditure. I by no means intend to imply that reduction has reached its final limits; we shall continue to strive for further reduction more and more; but it is impossible to say at what time or on what date additional reductions may take effect. Indeed, the incessant demands made on the treasury for countless objects of reform and improvement are too well known to the Council to require recapitulation here. Meanwhile we must take the receipts and expenditure as they are expected to stand. And with a deficit of 1½ million distinctly apparent, some recourse to additional taxation, some resort to means of enhancing income, becomes altogether unavoidable. Considering the actual deficits which have occurred in past years, and the circumstance that the year just over is expected to close with a substantial deficit, instead of the equilibrium that was expected, and this, too, despite all the exertions that have been put forth, we regard it as essential to the due administration of the finances and to the maintaining of the financial credit of the country, that yet further exertions should be made. Moreover, this is, if possible, even more needful than ever, since, as shown in my last financial statement, the public credit is to be pledged for the construction of extraordinary public works of a character remunerative to the State and beneficial to the people.

We are therefore compelled to propose, however reluctantly, to raise the income tax to 6 pies in the rupee, or 3½ per cent., and to apply to this Council to vote us the power of this covering by additional taxation the deficit which must otherwise be presented.

As explained in my last financial statement, there are great difficulties in immediately adding to our resources by any other means than direct taxation. If then the revenues are to be immediately enhanced, this can only be effected by the help of the income tax.

Such then is the proposal which I have, on behalf of the Government of India, to make to this Council, together with a request for leave to introduce a Bill for the imposition of an income tax, at the rate of six pies in the rupee.

I need not repeat the arguments used in my last financial statement regarding the imposition of an income tax in India. It is with regret and reluctance that we bend to the necessity of raising the rate from 1 to 3½ per cent. within so brief a period. But the recurrence of deficit at this time cannot otherwise be prevented.

I have stated the rate at 3½ per cent. In England, as the Council knows, there is no per-centage rate adopted for this purpose; the duty being levied at so many pence in the pound sterling. We have determined to adopt, as in England, a poundage in place of a per-centage rate. Following that principle, I have to propose that the duty be for the future taken at so many pies in the rupee; two pies would be assumed as the approximate equivalent of one per cent., four pies at two per cent., and so on. I should add that this mode of rating the duty will be somewhat (though very slightly) in favour of the revenue.

But if the rate is to be thus raised, then the principle of rough assessment by classes in the

the schedule which regulates the existing tax, can no longer be adhered to. A system which may have worked sufficiently well while the rate of duty was low (that is, one per cent.) will no longer work satisfactorily when the rate becomes higher. When people come to be assessed to six pies in the rupee income tax, they will assuredly demand a more precise mode of assessment than that which now prevails. The tax-payer will require that the assessment be made upon some fair estimate of his particular income, and will not be content to be assessed upon an average derived from the maximum and minimum incomes of a class. Now, if anything like an assessment on estimated income of each individual tax-payer is to be attempted, returns of income must be called for from the tax-payers. Or even if with the lower classes of income the collector may be able to dispense with the returns, he must clearly have the power of calling for such returns in all cases of more considerable income, and with the higher classes of income he should be obliged to call for such returns. The new Bill, then, which I have to lay on the table provides for the assimilation of the procedure to the more regular methods of assessing income tax; care having been taken to render it as simple and easy as possible, consistently with the important object in view. If the Council shall grant me leave to introduce the Bill, I shall have further opportunity of explaining its provisions.

Having thus explained the principle of the tax, I must advert to the method by which the estimate of its probable yield has been framed. As the Council will have observed, the amount is taken at 2,180,000 £, of which 2,100,000 £ is assumed at the known rate of 700,000 £ for each one per cent., and 80,000 £ for the gain by the substitution of 6 pies in the rupee for three per cent. I say known rate, inasmuch as the regular estimate of the one and a half per cent. income tax of 1869-70, based on data of 11 months' actuals, gives 1,051,000 £, which again gives 700,000 £ for one per cent. This seems a sure foundation to proceed upon, especially as it is known that in 1869-70 the tax was exposed to disadvantages which will not recur. Some portions of the tax collected in the first month had to be credited to the preceding year; the extra one per cent., imposed in the middle of the year, could not be fully realized at first; some arrears are indeed known to be outstanding. This consideration justifies our expecting more than 700,000 £ for one per cent. and our assuming 700,000 £ for each one per cent.; though otherwise it might be apprehended that each ascending step in the percentage would yield somewhat less and less. The estimates of the local governments, embodying what they intend to demand and collect, framed for a 1½ per cent. tax, amount in the aggregate to 1,103,740 £, which at three per cent. would yield 2,287,480 £, which is more than what we have ventured to take. Then we have compared the yield of the first income tax of 1860. The only year in which that tax was fully collected was 1861-62, when it produced 2,054,696 £, or just over two millions at four per cent. on incomes down to 500 rupees (50 £) and at two per cent. on incomes between 500 rupees and 200 rupees (20 £). What portion of this belonged to the division between 500 rupees and 200 rupees, I cannot state; but it must have been small. On the whole it may be said that we now expect to get from a three per cent. tax rather more than what we got from a four per cent. tax 10 years ago, showing an expected improvement of 25 per cent., and more. This seems a reasonable expectation, when it is considered not only that the income of the country has greatly increased within the 10 years, but also that our administration of these kinds of taxes has improved. As a proof of the improved administration, I may observe that in 1864-65 there was a three per cent. income tax like the one now proposed. It yielded 1,300,000 £, which gave 433,000 £ for each one per cent. But then the assessments made at the outset had been continued without alteration from year to year, and the administration was less strict than it now is; though it is still far from being as strict as it might be. But we have seen that in 1869-70 one per cent. yields 700,000 £ for one per cent., showing an improvement of 61·7 per cent. over 1861-65.

As to the duration of the new income tax, I can make no promise whatever. It is our earnest hope that the tax may not last beyond the current year 1870-71, at its present rate. But the realization of any such hope must be entirely dependent on circumstances.

Such then is the budget for 1870-71, the estimate of receipts amounting to 52,327,555 £ or 52½ millions, and of ordinary expenditure to 52,164,315 £ or 52¼ millions, leaving a small surplus of 163,440 £, a balance which hardly amounts to more than an equilibrium. We bear in mind that the above estimated surplus is very small; smaller than we should wish it to be; smaller indeed than it ought to be. But then what difficulties, what sacrifices we have had to undergo, in order to make it even the little that it is! The Secretary of State has enjoined us to provide a substantial surplus if we possibly can. His Grace commenting on my last financial statement, wrote thus:—"In previous financial despatches to the Government of India, it has been stated that your estimates should be so framed as to show a probable surplus of from half a million to a million sterling; in that opinion I concur * * * I have already called your attention to army charges * * * and I shall hope to find that you have been able to effect reduction of expenditure also in some other branches of administration. Unless this can be done, it is clear that it will be necessary to devise some means of increasing the annual income, or otherwise a failure in the full estimated receipt from opium, the loss of any portion of revenue from unfavourable seasons, or any extraordinary military charges, would certainly convert the estimated surplus into a large deficit."

My exposition to-day will have shown how hard we have striven to act up to these instructions. We have reduced the army charges and other expenditure. We have devised means of increasing the annual income. But we have not yet been able to provide a surplus

Appendix, No. 8.

of half a million in the estimate. To effect this, we must have proposed a greater reduction of expenditure than what we can surely reckon on effecting within the year; or else we must have proposed additional taxation even beyond the proposals I am announcing to-day; and the difficulty of doing this is manifest. But though we are unable to provide the surplus to-day, the necessity of such provision within the earliest practicable time is constantly present to our consideration. Until this is fully effectually provided, I shall not be able to affirm that our finance is in a satisfactory condition. As yet I can only express my hope that it will be found to be improving.

Besides the ordinary expenditure, we are prepared for an expenditure of 3,062,300 L., or over 3 millions, on public works extraordinary, to be provided for by loan, of which 1,732,500 L. or 1½ millions are for irrigation works, and 1,229,800 L. or 1¼ millions, for State railways. The irrigation works relate to projects in Bengal, in Madras, in Bombay, in the North-West Provinces, in the Punjab, in Oude, and in the Central Provinces.

The principle of constructing some portion of the railways in India by direct State agency instead of through companies, has been further affirmed during the year by the Secretary of State. The lines on which the above expenditure is to be incurred, are the Lahore and Peshawar Railway, the railway between Delhi and Jypore passing through the salt-producing districts of Rajpootana. Within the year it has been decided that the Bombay special funds works shall no longer be classed as extraordinary, but shall be included in the category of ordinary works: they are, therefore, not included in the above description. I may here note that the purchase of the property of the Elphinstone L and Company will not form any charge to the State.

I may here add that negotiations are in progress with the Maharaja Holkar, whereby his Highness will provide funds at 4½ per cent. interest for the construction of a railway from Malwa to join the trunk line of the Great Indian Peninsula Railway.

A desire has been often expressed that an audited account should be promulgated annually of the sums raised for, and spent on, public works extraordinary. Such an account is now being prepared, and is to be kept up from year to year. We have decided to commence the account from 1869-70, being the year when the classes of works to be reckoned as extraordinary were for the first time defined, and when the raising and the expending of money for those purposes were regulated on that principle.

I have now to advert to the loan arrangements of the year 1870-71.

It will be recollected that in my last financial statement I announced a series of loans aggregating five millions, of which one million consisted of renewal of old debt, 3½ millions of loans for public works extraordinary, and half a million to recoup the cash balances for advances made to municipalities. The renewal of one million has been effected within the just expired year. Of the 3½ millions for public works extraordinary, two were to be raised in India, and 1½ in England. The half million has been raised in England, instead of being raised, as was first intended, in India.

In my last financial statement, however, I mentioned that the cash balances are not even yet restored to their due proportions, and I added that "if, as the year proceeds, the accounts shall be unfavourable, some additional temporary resource will have to be provided." Within the year, the Government of India has accepted an offer of the Maharaja of Puttiala to invest 400,000 L. in our public securities. This having now been treated as permanent debt, we have decided to consider it as having been raised for public works extraordinary.

This sum, added to the sums raised on account of the three millions and a half loan which were slightly in excess of that amount, brings up the total to upwards of four millions.

Out of the four millions raised as above for public works extraordinary, and held at the credit of this branch of the Public Works Department, 2,616,743 L. or more than 2½ millions, are being spent in the year, leaving 1,383,257 L., or nearly 1½ million, balance in hand due by the loan department to the public works, and to be carried on to credit in the State account of the works.

So much for the year 1869-70; then for the year 1870-71, the proposed arrangement is as follows.

As I have already explained to-day, the proposed expenditure during the year on public works extraordinary amounts to 3,062,300 L., or just three millions to be provided for by loan.

The Secretary of State has intimated his intention of raising two millions in England, leaving us to borrow in India such sums as may be found necessary to carry on the works on the scale intended. But considering that we have, as shown above, a balance in hand of loan money to the sum of 1½ millions from 1869-70, we are unwilling to borrow if we can help it. And in the present state of our cash balances, there is no apparent necessity for bringing out any loan in India at all. It is not then our intention to raise any funds by loan until the autumn at least. By that time, the prospects of the year will be more clear, and our position in respect to ways and means can be reviewed, and a further decision as to the necessity or otherwise of raising any loan can be arrived at. But it is our hope (as at present informed) to conduct the finance of the year without further loan.

I should here add that in December last, we decided that the holders of the 5 per cent. Public Works Loan of 1855, amounting to two millions, which fell due for repayment on the 31st March, should have the option of either receiving payment in cash, or of accepting fresh stock of the four and a half per cent. loan. The returns are not quite made up, but about

about seven-eighths of the stock has been, or is being, tendered for conversion; so that it may be said that our terms have been generally accepted. This, indeed, is only what might have been anticipated, inasmuch as for some time past the $4\frac{1}{2}$ per Cent. stock has been quoted at or above 2 per cent premium.

Such being the provision made for the ways and means of the year, I have to explain the returns of the cash balances. In my statement of last year, I explained what a variety of large items, over and above the revenues and expenditure proper of the Government, contributes to make up this great account. It has been found, however, that the old form of statement was in some respects obscure, and an improved form has been devised, as the Council will see, according to which the figures are exhibited for the years 1868-69, 1869-70 and 1870-71. As the returns received from England often affect those obtained in India, both categories have been combined in this statement. I shall just glance at the main features of the statement for 1870-71, so as to make the technical designations intelligible. The headings of ordinary income, of ordinary and of extraordinary expenditure, are taken from the budget of the year as to-day presented. The heading of deposits and advances comprises the finances of the local funds, the funds of the civil services, the judicial deposit branch, the advances for local works and for a variety of purposes. The heads of local remittances and inter-provincial and inter-departmental transactions represent the unadjusted expenditure of India, and are interesting items. The remittance account between England and India comprises a large amount of civil service pensions, and a variety of petty advances in the military branch. There are also a good many unadjusted items under this head. The bills of exchange represent the amount remitted from India annually to meet the expenditure in England. The railway capital heading means the amount raised in England for the construction of railways in India. Here it may be observed, that year by year we are spending more in India than we raise in England; this arises from the fact that in previous years we spent less in India than we received in England, and that we have now to make up the difference. The last item, namely, "borrowed," must be taken together with the item of "debt paid." This year we are to borrow $5\frac{1}{2}$ millions (5,808,770 £), but then we are to pay off old debt of $2\frac{1}{2}$ millions (2,220,470 £), which leaves 1,830,000 £ for the Elphinstone property at Bombay, and 1,758,300 £, or nearly two millions new loan in England. In all 3,588,300 £ or $3\frac{1}{2}$ millions will be added to our debt.

I must now advert to the amount of the cash balances. According to my last statement, we hoped to commence the year just closed 1869-70, with a cash balance of 11,917,473 £ or close on 12 millions, but we really did commence it with a balance of only 10,175,804 £ or less than 10½ millions. In case this discrepancy be attributed to some fault in the account department, I should, in justice to that department, explain that such is not the case; for that part of the statement which depended on the account department turned out correct enough; the discrepancy occurred in that part of the estimate for which the Government of India is responsible. The difference indeed arose solely from the income of the year 1868-69 being less, and the expenditure more, than was anticipated. The causes I have already explained to-day in the earlier part of this exposition. Again, in my last statement, the cash balance at the close of the year 1869-70, was estimated at 11,627,310 £ or 11½ millions. It is now expected to amount to 13,644,859 £ or more than 13½ millions. The Council will naturally ask how it is that, notwithstanding the financial troubles of the year, we end with more money in the treasury than was expected? The answer is, that out of the $8\frac{1}{2}$ millions borrowed for public works extraordinary during the year, we have still one million in hand, and that there was the Puttiala loan besides to the amount of 400,000 £. Also the accident of the first English mail of last month, March, not having reached Calcutta till just after the close of that month, has caused a quarter of a million of bills and drafts, which were expected to be paid in March, that is, in 1869-70, to fall into the following year, 1870-71. This too partly accounts for the difference observable in the cash statement between bills drawn and bills paid. The last-named sum of the cash balance is still, however, to some extent only an estimate which may be disturbed by variations in items on either side of an account, which, both sides taken together, amounts in all to 168 millions. This estimate then of cash balances is nothing more than the balancing entry at the end of a really vast account. It has, however, been further checked by the actual assets in the various treasuries in India at the latest dates. On the 31st January last, there were actually 11,839,097 £ or nearly 12 millions in hand; on the 28th February (the latest month), there were 12,692,129 £ or over 12½ millions. Telegraphic estimates received from the several local accountants general so recently as yesterday, make the actual cash balances on the 31st March 13,500,000 £. These estimates being framed with a knowledge of the actual balances at the presidency towns, and with recent information as to the state of the balances at the more important treasuries in the interior, are not likely to be far wrong. The result, thus derived from opposite and independent data, corresponds very nearly with the amount (13,644,859 £) worked out from our estimate, and gives me considerable confidence in its general accuracy. The estimate must be exhibited in this manner, under our existing system, although it is exposed to so many chances. But I have now endeavoured to narrow the uncertainty by the comparison with the actual assets at the commencement of the eleventh month of the year, and at even later dates, which leaves a margin of one month only, or even less than one month, for uncertainty.

Commencing then the current year 1870-71, with a cash balance of $13\frac{1}{2}$ millions as above seen, we estimate the receipts of our general treasury, including revenues, deposits, recoveries, loans, and the like at 84,265,466 £ or $84\frac{1}{2}$ millions on the one side; and the disbursements, including expenditure, ordinary and extraordinary, payments on account of

Appendix, No. 3.

debt, of Secretary of State's bills and the like, at 73,696,023 L. or 73½ millions on the other side, leaving a balance of 10,569,443 L. or 10½ millions, as the cash balance at the close of the year. It may be here asked why we expect the cash balances to be less by three millions this time twelvemonth than they are now. The answer is, that we are to spend one million on public works extraordinary more than we borrow; that we are to advance half a million for the construction of railways in India more than we receive on that account in England; that the remittance account shows an adverse balance; that in the deposit and advance account, the payments are slightly to exceed the receipts. These several items fully account for the difference.

Having now completed my exposition of the finances, I shall, before concluding, mention that the subject of the financial relations between the Supreme Government, and the several local governments is still under the consideration of the Government of India. I have, of course, formed and recorded my own opinion on the whole subject. But it is really not in my power to say anything regarding the matter on the present occasion, as I cannot tell what decision will be arrived at, or by what time, if formed, it could be carried out.

I may here add that some additional portion of the cash reserve of the paper currency department, will probably be invested in Government securities. The Council may remember that in my last financial statement, I mentioned that the note circulation had risen to an amount above ten millions; it has since then risen further at one time to a sum between 11½ and 11¾ millions, though of course there are fluctuations from time to time. The gradual and progressive increase in the circulation has been held to justify our enhancing a portion of the reserve which is held in Government securities. The amount thus to be held in securities is limited by law to four millions. We propose to extend that limitation to six millions, and for this we have the express sanction of the Secretary of State. I have introduced a Bill for this purpose into this Council. The operation if authorised would be cautiously tentative, and some considerable time may elapse before the limit is approached.

It is a source of much regret to me that we have not yet been able to promulgate the rules, long since prepared, for the further development of savings banks in the interior of the country. But it has been necessary to consult many local authorities, and some delay has been unavoidable. The matter is, however, receiving attention.

As the Council probably knows, no marked result has as yet been produced by the Notification of November 1868, whereby it was announced that the sovereign would be taken at the Government treasuries as an equivalent for Rs. 10 4, instead of 10 rupees as before. The total number of sovereigns received in the Calcutta Treasury alone since that date exceeds 150,000. The importation of gold into India from November 1868 to January 1870 amounted to 7 millions sterling against 6 millions of the corresponding previous period.

In my last financial statement, allusion was made to the satisfactory condition of our public credit as proved by the prices of the Government stocks of all denominations. This favourable indication has again lasted throughout the year 1869-70, and this notwithstanding the prospect of the revenues turning out less, and the public expenditure more, than was estimated for. During this year the premia on Government 5 per Cent. stock reached 9½ per cent., which rate was maintained through the months of June and July 1869; at the same period the premia on 5½ per Cent. stock exceeded 14 per cent.; the price of 4 per Cents. at that time ranged between 94 and 95, a rate that has since been steadily maintained. The gradual decline since 1868 in the value of 5 and 5½ per Cent. stocks may of course be attributed to the diminution of the period for which the loans at those rates have currency. The loan of two millions bearing four per cent. interest, which was raised in India in April, the first month of the year, was subscribed on favourable terms, that is to say, at the average rate of 90½ for every hundred rupees; the result being that the money was obtained at just over 4½ per cent. Subscriptions were invited by tenders, that is, by open competition. Though the amount required was not more than two millions, yet the aggregate of tenders came to upwards of 5½ millions, and the number of persons who made tenders came to 611. Of the amount of tenders accepted, about one-fourth belonged to natives of India: again out of 246 parties whose tenders were successful, 121 were natives.

Such then is the budget for 1870-71. The main points in my exposition have been—

That, for 1868-69, the deficit of income as compared with the ordinary expenditure, originally estimated at one million, has, from various causes, swollen to 2½ millions.

That, for 1869-70, instead of the equilibrium expected to be maintained between income and ordinary expenditure, there will be a deficit;

That, nevertheless, this deficit, which at one time threatened to be great, has been much reduced by additional taxation and by retrenchment of expenditure;

That from this additional taxation and this retrenchment of expenditure, the total gain to the finances within the year has amounted to 1½ millions;

That, for 1870-71, there is estimated a small surplus of income over ordinary expenditure;

That this estimate is arrived at after doubling the income tax, and reducing expenditure in the army and on the public works by 1½ millions;

That

That after balancing increases against decreases of all kinds, there is still a net reduction of $1\frac{1}{2}$ million on the total expenditure of all descriptions; Appendix, No. 3.

That, in 1870-71, there are to be two millions of new taxation as compared with 1868-69, and three quarters of a million as compared with 1869-70; which taxation, however, for the most part, falls on the middle and upper classes, and but little on the poorer classes of the natives of India;

That the expenditure on public works ordinary which stood at $6\frac{1}{2}$ th millions in 1868-69, has been reduced to 5 millions in 1869-70, and to 4 millions for 1870-71;

That, besides the ordinary expenditure, there has been an extraordinary expenditure on reproductive public works, to be provided for by loan, 1868-69 of $1\frac{1}{2}$ millions, and in 1869-70 of $2\frac{1}{2}$ millions, and that in 1870-71 there is proposed to be an expenditure of 3 millions;

That while the expenditure on public works ordinary has been falling, the expenditure on public works extraordinary has been proportionably rising;

That for the public works extraordinary, in 1869-70, there were borrowed 4 millions, out of which $2\frac{1}{2}$ millions have been actually expended in the year, leaving $1\frac{1}{2}$ million in hand;

That for the carrying on of public works extraordinary in 1870-71, at an expenditure of 3 millions, there are 2 millions to be raised in England, and that no new loan is to be raised in India at present, save the quarter of a million to be advanced by the Mahārājā Holkar for State railways;

That the object of our financial arrangements at present is to surmount the difficulties of the time, without adding anything to the national debt for ordinary expenditure;

That we are striving to adhere strictly to the principle of accounting separately for sums borrowed for extraordinary and reproductive public works.

In concluding my exposition last year, I spoke of growing commerce and of expanding income. To-day, unfortunately, I have had to speak of trade depressed and of income diminished. But last year, I spoke also of an ordinary expenditure held in control; of the application of State capital to material improvement; of the resources furnished by public credit. And to-day, fortunately, I have been able again to speak of these. Last year the burden of my exposition was the existence of deficit. My hope then was that the deficit would be put an end to, but to-day I have had to acknowledge that the evil still exists, despite our efforts for its extinction. Once more, however, we have endeavoured to provide for at least an equilibrium, and even for a surplus. It remains to be seen whether this will be accomplished; but at all events no exertion will be spared for its accomplishment. And although great financial difficulties have occurred, still the general condition of the people, and the continued progress of the country, encourages us to hope that those difficulties, already so strenuously encountered, will be ultimately overcome.

His Excellency the COMMANDER IN CHIEF.—“My Lord, the time being very short which is to elapse before I quit India, I trust your Excellency in Council will excuse me for offering a few remarks to-day, instead of waiting for the discussion on my honourable friend's projects, which will take place at a date prohibiting my presence with regard to my engagements.

“In the first place, I would venture to say that the proposal to raise the income tax has, under the special circumstances which have been stated, my full support. I have always been opposed to a high income tax in India, and I am opposed to it still, and I have been engaged in many a struggle against such a tax for this country when reasons could not be assigned sufficient to satisfy my judgment. I believe that a sound policy, under ordinary circumstances, demands that an income tax should not exceed one per cent. in India, and that a higher rate should be reserved as the resource for extraordinary emergencies.

“It must, I think, be admitted, with regard to what was published under the authority of Government last year, that although it may be inappropriate to apply the word ‘crisis’ to our difficulties of the autumn, it is certainly accurate to say that an extraordinary emergency had arisen. Unfortunately, as so clearly shown by my honourable friend, we are still labouring under the difficulties which may thus be called extraordinary, the inference being that the Government is justified in having recourse to what, I for one, must characterise as extraordinary.

“In support of this position I need hardly remind the Council that, whatever the goodwill of the departments of administration, the financial effect of reduction, even if as large as described by my honourable friend, stands, as he has so forcibly impressed on the Council, in need of other assistance. In short, it is to the development of resources, as well as to ministerial reduction, that we must look for relief of an effective kind. Perhaps, however, with my views about an income tax, I may express the hope that, at no great distance of time, other financial arrangements may lead to a reduced income tax. I may give utterance to the belief that the budget, now produced by my honourable friend, is one of transition; a budget which, by its trenchant, but as I hope temporary, dealing with the income tax is to afford the time which is required for the elaboration of other plans (plans calculated to add to the responsibility of local administration) to add to its independence

Appendix, No. 3. with a corresponding relief of the Imperial revenues. In support of this view I may mention that the Income Tax Bill is framed so as to affect but one year only, and that it will expire on the 31st March 1871.

"I now pass on from the general question of the policy of taxation announced by my honourable friend to a subject with which I am more immediately connected.

"It is apparent to the Council, from the figures laid before it, that certain credit is taken for military reductions, which either have been ordered, or which are expected to be ordered, in the course of the current financial year. The actual nett financial result has been stated at half a million of decreased expenditure. This result might have been larger but for circumstances beyond our control. Rather more than a year ago we received a very peremptory order from the Secretary of State to revise our military expenditure with the view, if possible, of reducing it by a million and a half of money. The challenge was fairly accepted by the Government, and after prolonged and careful consultation, comprehensive schemes were sent to England, which, if carried into execution, would not finally have fallen far short of a million in their economical results. These schemes affected the British cavalry and infantry in India, the British artillery, and the three Native armies. It was believed that these schemes had overcome the practical difficulty of all military reductions, namely, the combination of economy with the maintenance of existing strength where it was really wanted, the insurance of a considerable saving of money, without in any manner sacrificing military efficiency or political security. The strength of the British forces was to be maintained at the same number as that comprehended in the existing establishment, the staffs, both of the army and of the administration, were to be clipped, while the Native forces were to be reduced in the provinces where, with the advance of civilisation and in a peace which has now lasted for three-quarters of a century, the Government is able to dispense with a large part of its army.

"This opinion, with regard to Madras, is not only that of this Government, but we learnt from the Governor of Madras in Council two years ago, that he considered his military establishment too large; this opinion was uttered emphatically, and, to the best of my recollection, without solicitation from elsewhere.

"My testimony may not be worth much, but when appealed to for an opinion as Commander-in-Chief of the Bombay Army about the year 1864, I admitted that that army was capable of reduction with regard to the wants of the peaceful provinces it guards. At the same time some regiments were employed in guarding jails, that is, performing the duty of policemen.

"I now understand that Madras is willing to do something of the same sort with her soldiers. But I believe I am not wrong when I assert that the cost of a military sepoy is actually more than double that of a police sepoy, this difference of cost being produced by the larger number of officers connected with the former, the more expensive armament and clothing, and so on.

"Now it is clear that, if the expensive military sepoys are not wanted for other purposes, it is an extravagance to keep them up for civil ones, which would be as well, some say better, performed by the inexpensive policeman.

"I have often heard it asserted (I am not sure that I have not myself made use of the argument in former times) that it may be well to keep up a military reserve beyond immediate actual wants, and to employ this reserve on such duties. I am led to believe now that such an argument is hardly defensible, the more especially since our modern means of movement cause the State to hold at its disposal a military reserve not previously existing, namely, in the power for rapid combination and concentration of the forces from almost any part of the Empire.

"I believe that my honourable friend the Lieutenant Governor of Bengal has strong opinions on this matter, it being one of his recommendations, for an important part of the territory subject to him, to substitute military policemen for soldiers, on the ground of economy first, and, with regard to the special duties required, of efficiency also. I am not prepared to say that I entirely go along with my honourable friend, as I cannot hide from myself that the effect of military demonstration on the mind of a barbarous and uncivilised people is not without considerable political advantages, even if the soldiers be kept in a state of idleness as compared with the activity of policemen in discharge of duties. I am not prepared to admit that any duties of a military nature, which may be done by military policemen, may not be at least equally well done by the regimental sepoys. If there be failing with the latter, either as regards efficiency or mobility, this failing of efficiency or mobility is not really to be attributed to a particular organisation, but to those who direct forces, whatever may be their denominations. But this I do say, that that opinion is right in principle which asserts that a given duty, if it can be done by economical means, should be so performed, and that we therefore should shut out from our consideration all proposals having in view more expensive means of action for the avowed purpose of cherishing ancient establishments.

"In this Presidency it may be said, without fear of contradiction, that the Government of India has long been superior to any such considerations, the Army having been treated and considered solely with a view to its public uses only.

"Accordingly, when reviewing the forces last year, when considering our wide frontiers, and the extremely dangerous character of a large portion of them, the necessity of occasional concentration for the prosecution of a campaign almost at a moment's notice, we came to the conclusion that we must maintain the number of British and Native troops in Upper India as an absolute military and political necessity, although we might do something by the reduction of some corps, with their officers, and the manipulation of the remainder towards

towards the reduction of expense, and also to show that the Bengal Army would not escape its share of the general discomfort following on a large measure of reduction. Appendix, No. 3.

"I would ask the attention of the Council to consider the enormous area guarded by the Bengal Army, stretching as it does from Peshawar in the West, over twenty-five degrees of longitude, to Debrugarh in the East; I would invite you to consider the object of an army posted in the Panjāb, which not only looks to the peace of the frontiers and of the province, but is the guarantee of our foreign relations. I would ask you to recollect the duty of the Government of India as a paramount power to insist on peace being kept by the numerous feudatories subject to her.

"In a speech which I lately read of Mr. Grant Duff's, I observed that he could find no proper illustration of the areas and distances in India but the map of the whole of Europe, excluding Russia; in point of fact the honourable gentleman was referring to arrangements and distances in this our Presidency of Bengal only. In an empire of this magnitude it is interesting occasionally to scan the forces holding the possession. I think their slender numbers, when they come to be investigated, may fairly excite the surprise of the civilised world, if those numbers are compared with the duties performed, and the absolute security provided for the vast provinces and populations and outlying dependencies of this empire. I invite the attention of the Council to a Return I hold in my hand furnished by the Military Department at my request.

RETURN of Nominal Establishment and of Actual Strength of Troops in India, 29th March 1870, according to latest Returns received in Military Department.

	Nominal Establishment.	Actual Strength.
British Forces in India - - - - -	61,634	55,333
Bengal Native Army (including Panjāb Frontier Force) -	63,131	60,900
Madras Native Army (including 4,720 serving in Bengal, China, and Straits) - - - - -	32,431	31,202
Bombay Native Army - - - - -	26,880	25,178
Total - - -	184,076	172,613

Note.—The establishment of British troops has been recently altered to some extent, but details of future establishment are not exactly known.

The establishments given do not include 7,086 officers, including those in civil and miscellaneous employments.

The nominal establishment includes certain corps under the Foreign Department in Rājputāna. They are not included in the column of "Actual Strength of Troops under this Department."

Owing to the overland relief being in progress the actual strength of British troops is lower than it would otherwise be.

"Well, my Lord, from these slender numbers we proposed to reduce 10,000 Native troops, on the understanding that they would be taken from the Provinces where they are admittedly not wanted, but that military strength is to be carefully preserved where it is wanted.

"As a Commander in Chief about to hand over my not inconsiderable responsibilities to a successor, I can only say that I dare not recommend a reduction on any other principle. If we reduce our troops to a minimum we must have them in places where they are really wanted, and where they are quickly available, and we must pay much attention to the military character of the tribe or population from which our Native regiments are recruited.

"I am sorry to say we have not as yet been able to come to an agreement with the Secretary of State on this matter. I venture to think his advisers have not appreciated the value of the principle I have stated with regard to the slender general figure of our modern military resources. Agreed as we are, both in England and in India, that a reduction is proper, I trust this Government will be permitted to give effect to it in that manner alone which appears to be safe and sound. Otherwise there should be no reduction.

"Financially, this becomes the more important when it is recollected that the troops in Southern India are much more expensive than those in this Presidency.

"So far for the general question of distribution and reduction of troops.

"With reference to our European Forces, according to the figures I have already read, it must, I think, be clear to the meanest apprehension, that we have reached the absolute minimum. I believe that, by means of certain changes which have been laid before the Home Government, these Forces may be actually rendered more efficient than they now are, while their cost is considerably reduced. Our proposals are before Her Majesty's Government, who, to a certain extent, have moved in the directions indicated by us with regard to the infantry, although, as respects the cavalry and artillery, we are as yet unacquainted with the conclusions formed at home. The number of infantry corps has been reduced, but the number of infantry soldiers remains as heretofore.

Appendix, No. 3.

"My Lord, I have been in the most important situations in these armies for more than twelve years. I have been an acquiescing party to the successive reductions in European strength which began with the cessation of hostilities in 1859, because, till the last reduction of four years ago, I held the opinion that we were still maintaining war establishments. But I am convinced that we should not go further, and that to attempt a diminution of the existing British Forces in India is an inexpedient fraught with so much danger as not to be thought of.

"Although it is a mistake to say, as it is so often alleged, that the British Empire in India is merely one of the sword, and although we recollect that this empire really rests on a policy founded on justice and the rugged British character, it is nevertheless true that a certain armed British demonstration is absolutely necessary for dominion over public opinion, and the insurance of the institutions to which we trust for the civilisation of the country. It is, to your administration, what iron is to the blood—on the due proportion of the iron, vital power depends.

"I came out to India in 1857, to assist in putting out the terrible conflagration which had been caused by the forgetfulness of this simple truth on the part of the authorities responsible for India in this country and at home. I pray to God that such blindness may not overcome again those who have to answer for the destinies of this magnificent country!

"My Lord, there are many things on which I could willingly descant with reference to the systems, and the recourse to more economical arrangements, which might be pursued in these armies. In those with which I am acquainted, namely, of Bengal and Bombay, I believe the existing system is working fairly well. So far as I am able to judge, the discontent which was rife some years ago has generally died out. For Madras I cannot answer, as I have no personal knowledge of the Army of that Presidency. But the changes which have been stereotyped with us, and have now lasted for many years, are comparatively new to Madras. For such things, the action of time is at least as much required as any artificial resource. This, as yet, Madras has not enjoyed.

"Your Excellency has had an opportunity of seeing the troops of this Presidency on two great occasions, and also, I believe, in Bombay; and I will leave it to you to say whether in appearance they can be surpassed by troops of other countries. During the last few years, there have been the campaigns of Bhután, Abyssinia, and Huzára; and it is but right to say, for the troops, that their zeal, readiness, mobility, and forwardness in the field were not to be surpassed. There is one thing, of which in the interest of true economy and of political safety, I would warn the Government, and, perhaps, I may say the officers of the army. I would warn them against the vice which is apt to creep insidiously over all armies in times of peace, namely, the tendency to press for more comforts, more material advantages, in short, for things which cause the soldier to forget the object of his enlistment, and to believe that he is to be preferred to the public economy.

"In a country of caste like India, unless the officers who deal with the native troops watch themselves, the influences of caste are apt sometimes to affect even the British officers, and to cause them occasionally to think caste-interests of greater importance than military ones. This mischief was actually seen in the old Bengal army. It does not, I believe, now exist, at all events in this army of Bengal; but I must repeat, it requires never ceasing vigilance to prevent the vicious tendency from cropping out.

"In the British army we have not this to contend against; but we have something else which also requires the utmost watchfulness. I allude to what may be called the exaggeration of sanitation-theories, which, while exhibiting at times the utmost difference of opinion among the authorities proffering their advice, would, not seldom, if listened to in their integrity, deprive the British soldier of his usefulness altogether for the purposes on account of which he is brought to India. Whilst warning against the exaggeration, I gladly admit the facts of the great improvements of late years for the health of the British soldier, and I believe I have not been slow to forward them during my long term of office in Bombay and this Presidency.

"I have had the great satisfaction of urging forward the two new Hill-stations of Chakráta and Ránikhet, the former of which is already occupied by a British regiment, and the latter will receive some 500 men this year. I think this policy may be still further extended, and that we may safely create Hill-stations for three more British regiments, in addition to those already occupied. Then, in addition to our sanitary depôts, we should never have less than seven or eight entire corps on the mountains in this Presidency; that is to say, a fourth of the infantry regiments quartered in the Himalaya as entire corps, while very large detachments from the remaining infantry, the cavalry and artillery, would fill the depôts. My recommendations to this effect have been before the Government for some time.

"As a matter of economy as well as of humanity to our countrymen, this policy should be extended to the utmost limit consistent with political security.

"In the course of my remarks, I have adverted to the new military strength accorded to us in these days, as compared with former times, in the power for immediate combination and concentration. This reflection leads us at once to another point, namely that, in the combination of the Military Departments of the several Presidencies into one War Department under the Government of India, with a corresponding change in the system of command-in-chief, may be found a measure giving at once improvement in economy and increase of strength. There should be but one War Department, which would at once involve the consequence of one Ordnance Department; in short, the concentration of the army in the largest sense in the hand of the Government of India. This need by no means interfere with

with the local character of the native forces of the other Presidencies, a character which, I believe, a sound policy bids us carefully to maintain. Appendix, No. 3.

"It has always appeared to me that, in this country, many things are centralized which ought to be local and dependent on the Local Governments; whereas those establishments are kept separate, and, as it were, almost distinct from the immediate control of the Supreme Government, which, from the nature of things, especially belong to it. Such is the case with military administration. We do not see the Federal States of America maintain distinct military organisations for the payment of which Congress is responsible, although, in other matters, the provincial Governments of the States exercise a very large power.

"There is no reason for separate military administration in Madras or Bombay, which would not equally apply to the several Governments making up this presidency. So long as this separate system lasts, I am hopeless of real economy or of breaking down the influences and jealousies which meet your Excellency at every turn when economical schemes issue from this Council. I need hardly remind this Council that I ventured to utter these opinions very many years ago, when they might have been supposed to be contrary to my personal interests. A long and practical experience of government and command, first in Bombay, and afterwards in association with the Governor General, have only tended to convince me that these opinions are right and should be carried into execution. Whenever reforms in such a direction take place, I may say, with regard to the office I am about to lay down, that some modification is necessary.

As your Excellency is aware, I received the instructions of the Secretary of State for India, when I was appointed to this command, to be as much with Government as possible, regard being had to my essential military duties. That instruction was enforced by the orders of his Royal Highness the Field Marshal Commanding in Chief. Well, I have tried to fulfil those instructions, and have been more assiduous in my seat in Council than, I believe, the great majority of my predecessors. Not sparing exertion and activity, I have sought to carry out my duties of inspection in hurried spring and autumn tours. I believe that, in consequence, the troops have been visited by head-quarters quite as much as in former commands. But the strain imposed in the attempt to carry out the instructions with regard to the two sets of duties has been often such as almost to exceed the strength of any man, while my visits to the several stations and my residence among the troops have been shorter than I could have wished; this not unnaturally caused my mode of exercising command to be misconstrued in many quarters. I think, then, that, in any revision of the establishments with regard to economy or other considerations that may be entertained hereafter, the points I have mentioned, although personal to myself, are not without significance, and should be duly weighed. How the necessities of the administration, on account of what is now done by three military departments, and how the military command should be dealt with in the three presidencies, in order to overcome the inconvenience and the want of economy now experienced, I have more than once during the last ten years suggested to Government. It is sufficient to say that we have, in my opinion, the right model in France, where the head of the army is the executive War Minister, while the Military Command of the Corps d'Armée is conducted by lieutenant generals whatever their titular military rank.

"There is one more point to which I would invite the attention of the Council, that being the tendency to growth of non-effective establishments. I need not advert to the statements of General Hanyington and Colonel Broome, beyond uttering the remark that, while these distinguished authorities differ in detail, they are agreed in presenting a picture of future liability which is positively alarming. In short, we are threatened with the serious danger of all our economies in India, in the combative forces being eventually greatly more than swallowed up in the growth of the non-effective expenditure. Under such circumstances, a further greater danger might be forced on by public outcry, involving perilous reductions to meet non-effective charges.

"It has been my duty, more than once, to submit my views as to how this difficulty may be fairly and properly encountered while there is yet time. It would be premature to dwell on the suggestions of one member of this Government on this particular subject, which I presume must be sooner or later dealt with in an authoritative manner, and may be said to be still *sub judice*, although this Government and the Secretary of State have not as yet come to an agreement on the subject. But I need not suggest to the Council that the subject is one of great and of increasing importance. My honourable friend in charge of the finances cannot press his attention too strongly to it.

"In conclusion, my Lord, as one who has been intimately associated with the armies of India for more than a quarter of a century, and, for the latter half of that period, has been in places of the greatest responsibility, who has watched the causes and progress of change through this long period, and has been in general one of the chief executive authorities for carrying out the reforms impressed on us from time to time by Her Majesty's Government, I may, at this last moment of my discharge of duty, declare my confidence in the military arrangements sanctioned by your Excellency in Council, and my belief that the army does justice to the care bestowed on it by the Government."

[His Excellency the President.] "I am anxious on this occasion to deviate somewhat from the usual course, and to make to my colleagues in this Council a statement with regard to the proceedings of the past and ensuing year of the Department of Public Works, of which I am the Member of Council in charge.

"I believe that great advantage would be derived if this practice were more generally adopted, and if Members of Council in charge of the great expending departments of this

Appendix, No. 8. Government would take advantage of the production of the budget to lay before their colleagues a short abstract of the mode in which these great sums of money have been and are to be disposed of, in order to give to the public an opportunity of knowing in detail how these sums are likely to be expended.

"I think, therefore, that in adopting this course, I am adopting a course which is now pursued in almost every Government in the world, namely, that at certain periods of the year, even under the most absolute rule, ministers do, on their own responsibility, make statements on the position of the departments over which they preside.

"Should the course that I now propose to take with regard to public works in India receive the general approval of the public, I propose to extend that practice to another year, and endeavour to induce some of my colleagues to make similar statements.

"No other opportunity is likely to occur—I regret that the present hour is so late, but still I am anxious that at the earliest possible moment the public should be placed in possession of those important facts to which I now invite the consideration of my colleagues.

"Many of these facts which I now bring forward and state to the Council would, in ordinary course, hereafter be laid before the public. But we are all aware that when facts such as these are merely stated in various departmental reports, they are necessarily stated at great length and in a somewhat disjointed form, and my belief is, that these matters do not receive from the Indian public that fair attention which their importance deserves, and I think the Government would obtain much advantage from wider criticism and greater discussion of these subjects by those who take an interest in public affairs.

"With this preface I propose to make as brief a statement as I can as to the expenditure of the Public Works Department during the past and ensuing years.

"The total expenditure on public works in England and India for 1869–70 will be about 8,000,000 £.

"I give the figures as nearly as possible in round numbers.

"This great sum will be divided into two heads, viz., Ordinary and Extraordinary expenditure; the Ordinary expenditure representing that which we expect to be able to pay out of the revenues of India, and the Extraordinary, that which is to be defrayed by loan.

"Under the head of Ordinary we shall have spent in the year which has just come to a close a sum of something like 5,300,000 £.

"Under the head of Extraordinary we shall have spent the sum of 2,600,000 £.

"Of the 5,300,000 £ which I have just mentioned under the head of Ordinary, 5,000,000 £, as nearly as possible, will be spent on public works. The remainder will be made up of smaller items, such as state railways, official expenses connected with guaranteed railways, and loss by exchange.

"In the Extraordinary expenditure for the past year, the great item will be that of two millions of money spent on irrigation works; a small sum has also been taken for the commencement of state railways.

"The principal items of expenditure in India under the head of Ordinary will be—first, for military works nearly a million and a half sterling, of which the original works will take about 1,200,000 £, and repairs 227,900 £.

"£. 478,000 will be spent on agricultural works, of which 192,000 £ will be taken for original works, and 279,000 £ for repairs.

"£. 680,000 will be spent on civil buildings, of which the original works will cost 562,000 £, and the repairs 122,000 £.

"We then come to the important item for communications, which really means the construction and repairs of ordinary roads. In the year that is just closed we shall have spent under this head, as nearly as possible, 1,000,000 £; 600,000 £ of which will be spent on original works, and 4,000,000 £ in repairs.

"A smaller item of 58,000 £ follows for miscellaneous and public improvements, and then there will be the great item of 1,000,000 £ for cost of establishment, of which 70,000 £ will go for tools and plant.

"These will form the principal items of the Ordinary expenditure of the Government of India in the Public Works Department for the year just closed.

"Of the million and a half spent in India on Extraordinary works in 1869–70—

	£.
Irrigation works will take about	950,000
State railways about	144,000
The Bombay special fund	350,000

and the remainder will be made up of smaller items.

"It will be interesting to the public to know how this large expenditure of 6½ millions was distributed among the various Presidencies.

	£.
Madras will have received from its public works, about	835,000
Bombay	1,450,000
Bengal	1,360,000
N. W. Provinces	865,000
Panjab	565,000
Central Provinces	325,000

"The remainder will be distributed between British Burma, Oudh, Hyderabad, Rájputána, Central India, Coorg, and Port Blair.

"In

"In the middle of the year 1869-70, as the Council are aware, upon investigation and inquiry made at Simla into our financial position, the absolute necessity of an immediate reduction in the Public Works Department became apparent to all the members of the Government. After the fullest and most careful consideration, we came to the conclusion that unless a large reduction was made in this item of expenditure, it would be impossible to look to financial safety in the year. We, therefore, with very great reluctance, made up our minds to a reduction of the public works expenditure of the Government of India to an amount of nearly 800,000 £, the actual sum being 792,500 £.

"Well, the necessity of the case was speedily recognised in a manner that was almost surprising, and with scarcely a single exception, the local governments so far seconded our efforts, that the result has been obtained, and it appears that a saving will have been effected in the Public Works Department's Ordinary expenditure during the year even to a greater extent than was suggested.

"There are only two cases in which local governments will have exceeded their grant. Madras will have exceeded its grant by the small sum of 3,000 £, while according to the latest accounts Bombay will have spent 29,700 £ more than the reduced grant.

"This is the only case where a local government has been unable to carry out to the full the orders and wishes of the Government of India.

"I find that Bengal will spend less than the reduced grant by 2,400 £, North-West Provinces 500 £ less, Panjáb 82,700 £ less, Central Provinces 14,300 £ less, British Burmah 80,900 £ less, while the smaller governments will show a proportionate reduction. The result will be that, under this head of public works expenditure, the reductions that were ordered in so unusual a way will be entirely and successfully carried out.

"When we think of the very great sacrifice that the local governments have been called upon to make, when we know the great interest they take, and justly take, in all these works, I must say that the Government of India are deeply indebted to those Governments for the manner in which they have adopted our recommendations, and for the way in which, at very great sacrifice, they have been able to carry out our wishes.

"Well, so much for expenditure in the Public Works Department in the year that is just passed.

"I now propose to lay before the Council a similar statement with regard to the expenditure of the year upon which we have entered.

"I must, however, remind the Council that both as regards the past and the future years these statements are to a certain extent approximate. It is impossible, speaking on the second day of the financial year, that the fullest information with regard to the past can be at the disposal of the Government of India, and, as every one knows, with regard to the future the statement I am about to make is one entirely of estimate. All I can say is that in respect to large expenditure much power rests in the hands of the local Governments if they choose to exert it, which I am sure they will to keep the expenditure within the estimate, and in some instances to realize even more than the suggested saving.

"The expenditure, then, for the ensuing year in the Public Works Department will be placed at about 7,475,500 £.

"Of this 6,900,000 £ will be expended in India, and 500,000 £ in England.

"Under the head of Ordinary, 4,300,000 £ will be expended, and under the head of Extraordinary 3,100,000 £.

"Of Ordinary, the large sum of 3,900,000 £, or nearly 4,000,000 £, will be spent entirely on public works; the rest will be made up of the smaller items, such as official expenses connected with guaranteed railways, Calcutta and South-Eastern Railway, and loss by exchange.

"In Extraordinary, that is, the loan-works for the ensuing year, the two great items will be 1,780,000 £ for irrigation, and 1,220,000 £ for state railways. This head of expenditure appears for the first time in any magnitude in the public accounts. The remaining item is a smaller one for Port-trust works at Bombay.

"Well, then, of the 4,300,000 £ to be devoted to ordinary works, the military works will take about 1,120,000 £; of that 900,000 £ will be expended on new works, and 200,000 £ on repairs.

"The ordinary agricultural works will take 400,000 £, the greater part of which will be spent on original works, repairs, with a small outlay on guaranteed irrigation works.

"£. 618,000 will be spent on civil buildings, of which the new works will demand 390,000 £ and the repairs 120,000 £.

"£. 840,000 will be spent on communications, that is, on roads. The expenditure on roads and repairs will be divided very nearly in equal parts, as the original works will come to 400,000 £ and the repairs 430,000 £.

"There will be a small sum of 40,000 £ spent on miscellaneous public improvements.

"The cost of establishment which directs the whole will stand at something less than it did last year, being 900,000 £, and 60,000 £ for tools and plant.

"As I said before, of the 3,100,000 £ which will be spent on Extraordinary works:—

	£.		£.
Irrigation will take	1,700,000	Tools and plant	180,000
Original works	1,200,000	State railways	1,200,000
Establishment	300,000	And Port Trust works	150,000

Appendix, No. 8. "This gross sum will be as nearly as possible distributed to the different local Governments in the following proportions :—

£.	£.
817,000 to Madras	1,137,000 to N. W. Provinces.
1,370,000 to Bombay.	1,800,000 to the Panjáb, and
1,212,000 to Bengal.	300,000 to the Central Provinces.

"The reason for the Panjáb figuring for such a large sum this year is, that the great State Railway from Lahore to Pesháwar is to be commenced this year in that province.

"The remainder of this large sum will be divided between British Burma, Oudh, Hyderabad, Rajpootána, Central India, Coorg, and Port Blair.

"In round numbers, then, the expenditure on public works in 1869-70 will have been 8,000,000 £.; in 1870-71 will have been 7,500,000 £., or 7½ millions. But a heavy payment of an unusual character took place in 1869-70. Of the 1,400,000 £. which was spent in England in 1869-70, 1,040,000 £. was paid to the shareholders of the East India Irrigation and Canal Company for their property, which is better known under the name of the 'Orissa and Soane Irrigation Company.'

"If, therefore, this heavy item be left out, it will bring down the real expenditure in 1869-70 to 6,900,000 £.

"From this point of view, therefore, the total estimated expenditure for 1870-71, namely, 1,400,000 £., is in reality half a million more than the corresponding expenditure for the past year; so that if we exclude from the expenditure of the year that is just closed the payment for the property of the Orissa Company, we hope during the ensuing year to expend on works of public utility a much larger sum than we spent during the past year.

"But I must remind the Council that those great sums of eight millions in 1869-70 and 7½ millions in 1870-71 by no means represent the whole of the expenditure on works of public utility, and for which the Government is responsible in India.

"We shall pay in 1869-70 £. 1,570,000 in interest and nett charge on account of railways. The railway companies under Government guarantee will spend in the same year upwards of four millions on construction; so that in reality the gross expenditure on works of public utility in India during the past year, and the necessary expenses, that is, payment of interest on loans expended for similar objects, will amount to the enormous sum of nearly fourteen millions.

"In 1870-71, that is, in the ensuing year, in addition to the 7½ millions before referred to, we shall spend as our nett charge on account of railway interest 1,000,000 £., and the railway companies under Government guarantee propose in the same year to spend upwards of 5,100,000 £. on construction, making in all a total for the present year of upwards of 14,288,000 £.

"I wish the Council particularly to note these facts, because I do not believe that it is generally known that there is such an enormous expenditure going on in India for works of public utility.

"If we put these two great sums together, we shall have expended in the two years ending 31st March 1871, either from ordinary revenue, either from loan for interest, or through the agency of the railway companies under Government guarantee, the enormous sum of 28½ millions upon works of public utility in India, and their cognate expenses.

"This sum that we shall spend in two years is considerably more than the annual revenue either of Spain, of Italy, of North Germany, and three times as much as that of Holland.

"Now as to the proportion that these great sums bear to our own revenues. I find that in a calculation which has been kindly made for me by the Secretary of the Financial Department, the amount of nett available revenue of the Government of India for the year 1869-70 can only be counted at 28,900,000 £.; when I say available revenue, I mean those sums placed at the disposal of the Government of India the distribution of which is within their power; that is to say, that in making this calculation I deduct all imperative charges over which we have no control, such as costs of collection, charges, payments of interests, and charges for pensions, any payments made under treaty engagements, &c.

"If after making these deductions we take the nett available revenue of India for this year, we find that it only amounts to about 28,000,000 £. We shall have spent out of that sum in the year just closed, out of the revenue of the year, as I stated before, a sum of 4,800,000 £. on public works ordinary, which is nearly 17 per cent. on our nett available revenue. In the year 1870-71 we expect that our nett available revenue will be 28,090,191 £., and that we shall spend on public works ordinary 3,800,000 £., which will be nearly 14 per cent. on those resources over which the Government may be said to possess control.

"To look at it in another way: I find that the whole expenditure on public works, that is, the nett expenditure (deducting recoveries), amounts to 13,800,000 £. for this year, so that comparing that with our nett available revenue, we shall have spent on works of public utility during the past year something like 47 per cent. The per-centage will be increased during the present year, so that in reality we expect to spend within the ensuing year on works of public utility in India a sum nearly equal to half of our entire available revenue, and I believe this is an effort in the direction of public improvement that has hardly ever been attempted by any other nation in the world.

"But I wish now to explain to the Council the different proceedings which are to be undertaken during the ensuing year by the Government of India under various heads in the Public

Public Works Department, and for this purpose I shall place what I have to say under the heads of military works, civil works, agricultural works, irrigation, &c., and railways.

Appendix, No 3.

"Under the head of Military Works, the total sum spent in 1870-71 will be 913,000 £. for original new works, and 214,000 £. for repairs, making a grand total of 1,127,400 £.

"The sums for new works may be classed under the following main heads; viz:—

	£.
Accommodation for troops generally - - - -	654,305
Ordnance factories - - - - -	147,100
Gasworks - - - - -	5,500
Water supply - - - - -	21,495
Works of defence - - - - -	61,000
Roads to important hill stations - - - - -	19,000
For Port Blair - - - - -	4,650

Making in all a sum of - - - - £. 913,051

"Of the total sum assigned for 1870-71 under the heading of 'Accommodation of Troops,' viz., 654,304 £., the bulk has been devoted towards carrying on the great scheme of barrack accommodation for the British soldiers that has now been in progress for the last five years.

"It has been necessary to subdivide the allotment over nearly all the stations at which European troops are quartered, in view to provide for the urgent requirements at each station in the way of shelter; but it has been an object to concentrate the expenditure as much as possible, on the completion of barracks and hospitals now in progress, rather than on the commencement of new buildings, for by so doing it will be possible to complete a very considerable amount of shelter at each station during the year. The largest assignments have been made for the most unhealthy stations, or for stations at which the accommodation is most backward; thus,—

	£.		£.
Saugor - - - - -	29,000	Kurrachee - - - - -	20,000
Morar and Gwalior Fortress - - - - -	25,000	Peshawur - - - - -	15,000
Mhow - - - - -	19,000	Ahmednugger - - - - -	17,000
Nussecrabad - - - - -	19,000	Jubbulpore - - - - -	15,000
Belgaum - - - - -	22,000	Fyzabad - - - - -	20,000

"At other stations, where the call for accommodation is not so urgent, the allotments are somewhat smaller than the foregoing; thus,—

	£.		£.
Ambála - - - - -	11,800	Nowgong - - - - -	10,000
Rawal Pindi - - - - -	7,500	Bellary - - - - -	5,000
Seetapore - - - - -	9,000	St. Thomas' Mount - - - - -	5,000
Neemuch - - - - -	14,000	Kirkee - - - - -	10,000

"The allotment for Barrackpore, 7,700 £., will complete the barracks for both the single and married men of the two companies of artillery at that station.

"The allotment of 8,000 £. for Allahabad will also complete the accommodation of the regiment of infantry and battery of artillery at that station; so also will the allotment of 5,000 £. complete the buildings for the single and married men of the regiment of infantry at Cawnpore.

"Liberal provision for extending the accommodation at hill stations has also been made. A sum of 7,500 £. has been set apart for completing the temporary accommodation of the regiment of infantry at the New Hill station at Chukrata.

"An allotment of 10,000 £. has also been made for proceeding with new barracks at the New Hill station, Rani Khet, and an aggregate sum has also been allotted to the Old Hill stations at Dugshai, Kussowlic, Subathoo, Baloon, and Murree.

"The next item for consideration is that of the ordnance factories. The most important works under this head are the Snider factories and ordnance buildings in Bengal and Bombay (we do not yet know whether we shall be able to proceed this year with the Madras factory), and are specified as follow:—

Snider factory, Dum-Dum,

Ditto - Kirkee,

Ditto - St. Thomas' Mount, Madras,

Gun Carriage Agency buildings in Allahabad,

Powder works, gun carriage buildings, and magazine, Kirkee.

Hydraulic lift, graving dock, Bombay; and we hope some progress may be made in the new gun foundry at Cossipore.

"Funds are provided for completing the gas-works for lighting the barracks and cantonments at Allahabad and Rawal Pindce. These works are now far advanced, and are expected shortly to be completed.

"The next item is that of the water supply. The important projects under this head are—improved water supply for the large station of Ambála, and also for Trimulgherry, Kirkee, Ulsoos Tank (Bangalore).

Appendix, No. 8. "With regard to defence works, the most important of these are the harbour defences of Bombay, and the Rangoon pagoda and harbour defences.

"With regard to roads to hill stations, the sum allowed for this work is for opening up communications from the plains to the important hill stations of Rānt Khet and Chakráta.

"This, then, is a description of the works proposed to be undertaken during the ensuing year under the head of 'Military Works.'

"Under the head of 'Civil Works,' one of the principal grants will be made to Kurrachee Harbour. The Grant for these works for 1869-70 was 26,500*l.*, which was subsequently reduced to 25,500*l.* The Grant for next year is 26,500*l.*

"The estimates for these works aggregate about 430,000*l.*, of which it was expected that about 260,500*l.* would be expended up to the 31st March 1870, so that at the present rate it will take many years to carry out the scheme.

"But I wish to say, with regard to these works, that we hope to place them upon a somewhat different footing, and we are already engaged in seeing whether a local trust may not be created by which advances may be made, and therefore it might be possible hereafter that a portion of this expenditure may fall under the head of 'Extraordinary.'

"With regard to the Godavery navigation, the original Grant for 1869-70 was 70,000*l.*, which was reduced to 50,500*l.* The Grant for 1870-71 is 30,500*l.* only; all these figures being exclusive of establishments. The Grant for the First Barrier Works will practically complete them, and a good deal of progress may be expected with the amcut and locks at the Second Barrier.

"The construction of the road from the Dharwar Frontier to the Port of Karwār is a very important work.

"The Grant for the year 1869-70 was 13,340*l.*, and for 1870-71 it is 15,000*l.*

"This will probably complete that line of road.

"A sum of 147,500*l.* has been passed for improvements to the Bombay Harbour, 100,000*l.* of this being for the Moody Bay Reclamation.

"The whole of the expenditure it is proposed to debit against the Port Trust, which, it is hoped, will soon be constituted, on arrangements for the purchase of the property of the Elphinstone Company being concluded.

"With regard to the Madras gaols, the great progress made within the past two years with the new central gaols in that Presidency has allowed of a considerable reduction in the Grant assigned to them in 1870-71, namely, from 32,400*l.* in 1869-70 to 9,768*l.* in 1870-71.

"This latter sum will practically complete the principal gaols.

"In Calcutta a sum of 40,000*l.* has been assigned for the new High Court, which sum will complete it if the estimate be reliable.

"It has, however, been found necessary to leave the University and the Imperial Museum without any grant, as it is considered that it is much better to complete one work at a time than to endeavour, and only partially to complete, four or five.

"Amongst Civil Works the reduction in the Grant made in 1869-70 was distributed nearly equally between buildings and roads, so that the per-centage of the reduction on the latter head was considerably smaller than on the former. The diminished expenditure on ordinary roads is, however, far more than compensated for by the increased expenditure on railways.

"I now come to the important item of Agricultural Grants.

"There never was a year in which the benefits of irrigation were more decidedly evidenced than in the last year. The interesting reports from the North Western Provinces on this subject have attracted the notice of the public, and the statements which have been made are most remarkable and encouraging.

"In the unusually dry season of 1868-69 a great calamity was averted. It is stated on the authority of the Government of the North Western Provinces, and of the canal officers engaged there, that in that Province alone 1,425,702 acres were kept in a state of fertility which would otherwise have been unproductive.

"Colonel Brownlow and his officers exerted themselves to the utmost, and the result was that by their influence and constant energy, they persuaded the people to make use of the water principally for this purpose. The result was that in those irrigated districts there was a considerable increase in the production of the lower class of cereals, and I find that the 2,786 acres of that description of crop which were under irrigation in 1867-68 have increased in 1868-69 to the amount of 85,281 acres.

"The returns exhibit an increase of the extent of land watered of 665,023 acres over the preceding year, 96 per cent. more than that irrigated in 1860-61, the most recent year of scarcity, and 45 per cent. greater than in 1866-67, the previous maximum of irrigation. In the Meerut Division irrigation reached the extraordinary extent of 308,161 acres, or 39 per cent. of the entire culturable area of the district, exhibiting an increase over the preceding year of 103 per cent. These facts tend completely to show the enormous value of irrigation works.

"The Ordinary Grant for agricultural works for the current year now stands at 428,279*l.*, of which 192,199*l.* are for new works, 279,580 for repairs, and 5,500*l.* for State supply on guaranteed works.

"The Extraordinary Grant was originally 1,650,000*l.*, but the expenditure is not likely to exceed 900,000*l.*

"For

"For 1870-71 the following amounts are provided :—

ORDINARY.	£.	EXTRAORDINARY.	£.
New works - - -	169,420	New works - - -	1,246,400
Repairs - - -	322,500	Establishment - - -	300,700
State outlay on guaranteed works - - -	5,380	Tools and plant - - -	185,400
			£. 1,732,500
£. 497,300		GRAND TOTAL - - -	£. 2,229,800

making thus 1,415,820 l. for actual construction of new works, and 322,500 l. for repairs.

"It will be seen that the greater part of the Ordinary Grant will be devoted to 'repairs.' This arises from the necessity of maintaining in good working order the extensive systems of irrigation works already in operation in different parts of India, particularly in Madras, Scinde, in the Panjáb, and the North Western Provinces. Also in Bengal, a considerable sum is required for the maintenance of the numerous lines of embankments in the Orissa and other districts.

"The original works to be carried out from the Ordinary Grant are numerous, but with few exceptions, of no great magnitude individually.

"Numerous important works are in progress, and will be continued during the ensuing year from the Extraordinary Grants in Madras, Bombay, Bengal, North West Provinces, and Panjáb.

"In Madras the most important work that now engages attention is the completion of the canals in the Godavery and Kistna Delta. The local Government is furnished with such sums as it requires for this object, but owing to the limited supply of labour available, the extension and enlargement of these canals to the standard ultimately required must at best be a slow and gradual operation. During the current year the sum of 52,760 l. was allotted for these works, but the expenditure is likely to be somewhat less. Other projects on a smaller scale, but still of considerable importance, have been in progress in the Nellore, Madras, Tanjore, and Tinnevely Districts, and several entirely new schemes are now under investigation. For the latter the allotments proposed by the local Governments have been allowed to stand, but as the estimates will have to be submitted to the Secretary of State for approval, it is not likely that much, if any, progress will be made with them in the coming year.

"In Bombay estimates to the amount of 545,494 l. have been sanctioned as extraordinary, of which 305,898 l. pertain to a reservoir and canal near Poona.

"Several other large projects are under consideration, of which the most important is a line of canal from Roree on the Indus to Hyderabad, which is likely to cost upwards of 2,000,000 l. sterling. The estimate for this work is, it is understood, nearly ready, and in the event of its receiving the sanction of Her Majesty's Government, will probably be commenced in the ensuing year.

"In Bengal the extensive works which had been in progress in Orissa under the management of the East India Canal Company, having been transferred to Government, have been vigorously prosecuted, and the new works on the Soane, estimated to cost 2,100,000 l., have been commenced. Also a canal, which is likely to cost half a million sterling, from the Damoodah at Raneegunge to the Hooghly, has been lined out, preparatory to commencement of work on the estimates receiving approval.

"An extensive system of canals from the Gunduck, at an estimated cost of 1,384,820 l., for the irrigation of the Tirhoot, Sarun, and Champarán districts, and also for navigation, has been before the Government of India, but information on several important points is required before it can be recommended for approval.

"The works in progress in the North Western Provinces comprise various additions to the Ganges Canal, and its system of distribution channels; a canal from the Jumna near Delhi to Agra, estimated at 575,000 l., and several smaller canals in Rohilkhand. The latter form the commencement of a proper system of irrigation and drainage of the Terai Paganas.

"A scheme for a canal from the Ganges for the irrigation of Eastern Rohilkhand, estimated to cost about 1,000,000 l. sterling, has actually been before Government, and will be proceeded with on the necessary authority being obtained from the Secretary of State, and estimates for canals in Rohilkhand have also been under consideration. It is further proposed to open out a new feeder to the Ganges Canal with a view to intercept the whole of the dry-weather supply of the river above Futtehghur, and thereby to obtain the means of extending irrigation to the terminus of the Doab at Allahabad.

Appendix, No. 3. "In the Panjáb the improvement of the Bári Doab Canal has been in progress. The Kussoor and Sobraon branches, which formed part of the original project, and which were suspended from want of funds several years ago, have now been re-commenced on an estimate amounting to 270,000 £. The Sirhind Canal, estimated to cost 2,250,000 £, and designed to convey the water of the Sutlej to irrigate the tract between that river and the Jumna Canal, including the lands belonging to his Highness the Mahárájá of Puitiala, has also been commenced.

"This will, I believe, be one of the most magnificent works that has ever been designed or carried out in this country, and I am happy to say that the Mahárájá has shown the greatest disposition to assist in the project.

"A general improvement of the Western Jumna Canal, and the opening out of two important branches form the subject of another scheme, and a portion of the work has already been commenced.

"A project for a second canal from the Sutlej near Ferozepore, which will intercept the whole cold weather volume of the Beas, and give the means of irrigating the lower portion of the Bári Doab, comprising an area of about 5,000 square miles, is also under investigation, and an estimate will probably be shortly before Government.

"A scheme for a system of canals from the Sardah, and which is likely to cost nearly five millions sterling, has recently been before the Government of India. The detailed estimates for this great work, which is designed to irrigate the greater part of Oude and portions of the Benares and Jounpore districts, as well as to afford a navigable communication from the foot of the Himalaya to those places, are now being drawn out.

"If any person who takes an interest in these matters wishes to read a really able and interesting document, he might read the elaborate report of Captain Forbes, who is the best authority with regard to this scheme. We have it in our power to undertake great works in that district which will be as important as any that have ever been conducted in India. This is a slight sketch of what we are endeavouring to do for the furtherance of irrigation.

"I hope I am not detaining the Council, but I wish very briefly to refer to what has been done with regard to railways during the ensuing year.

"The year 1870-71 will be a notable year in the railway history of India. On the 31st December 1869, 4,264 miles of railway were open in this country, and we expect 5,061 miles to be open on the 31st December 1870, or at all events before the close of the financial year, so that if our expectations are realised, as I believe they will be, the average number of miles opened within the year will be 801 miles.

"Of this, the Great India Peninsula Railway will open 238½ miles of the north-east extension and 158½ miles of the southern. The north-west extension of the Madras Railway will open 94½ miles, and the Bellary Branch of the same line 32 miles, Khamgaon 7½ miles, Oomraotee 5, and Delhi 32½ miles. The East Indian Railway will open its Chord line of 123½ miles, and the same company the Kurhurbaree Branch of 24½ miles. The Eastern Bengal Railway will open the Goalundo Extension of 45 miles, and the Oude and Rohilkhand Railway, Byrom Ghât, 40 miles, making, as I said before, a total of 801 miles of railway to be opened during the present year in India.

"This is the greatest number of miles that has ever been opened in any one single year. In the year 1861, 745 miles were opened, and in 1862, 770 miles. The next largest number opened in one year was in 1864, when 446 miles were opened, but in 1868 we have only opened 80 miles of railway. However, I hope the honour will be reserved for 1870 to witness within the year by far the greatest number of miles of railway ever given to public use since railway construction was first commenced in India.

"The Council are doubtless aware that a great scheme has been laid down which we propose in the matter of railways, as far as possible, to adhere to, and that is the scheme for the construction of about 15,000 miles of railway. Of this 4,000 miles are already opened, 1,000 are in progress, and 900 are about to be commenced. We are actually at this moment endeavouring to do something more or less on 15 different lines of new railways. I should like, therefore, to mention very briefly to the Council what the principle of these undertakings are.

"From Delhi and Agra it is proposed to make a railway to the Sámbar Lake, which will, we believe, confer enormous advantages on the people of those districts by carrying corn and grain for their consumption, and bringing back return freights of salt and other productions of the district. Part of this system will also pass through the salt district of Sultánpúr, near Delhi. I am happy to say that the surveys of the Agra and Delhi Districts of these lines are very far advanced, and we have every reason to hope that on the Delhi section work will be almost immediately commenced. The estimates for the whole undertaking will be furnished during the ensuing year, and there is no reason why the actual work of this important line, both in the Agra and Delhi divisions, should not be commenced during the ensuing cold weather.

"On

" On the Panjáb State Railway, very considerable progress is being made. The whole of the line has been surveyed between Jhelum and Lahore. The designs for the three great bridges over the Rávi, Chenáb, and Jhelum are in progress, and we hope very soon to send home to the Home Government an estimate of, and the necessary orders for, the iron necessary for the construction of these great bridges.

" Notwithstanding the great expenditure which we shall be obliged to make upon these bridges, we believe that the estimates fully justify us in stating that the whole of that line from Lahore to Jhelum ought to be constructed at a cost of something like 11,500 £ a mile. The surveys through the South Panjáb for the Indus Valley line have been already commenced, and Major Macleod Innes and a party of officers have been engaged during the cold weather in the surveys of that important line in the direction of Sukkur. An engineer was sent out from England to survey a most important line of railway between Karwár and the cotton-producing districts of the Southern Mahratta country. Unfortunately, this gentleman arrived too late to make a satisfactory survey. It has therefore been necessary before the location was finally determined on, to cause a further investigation of the district to take place, but I am in great hopes that before very long the Government will be in a position to decide as to the exact direction the line ought to take. I must say, however, that it is likely to be an expensive line.

" In the north of the Bombay Presidency considerable railway extension has been sanctioned.

" The Bombay and Baroda Railway, the length of which is about 73 miles, is already in course of progress, and the construction of the line to Verungaum and Wudwan will be commenced as soon as the estimates are sanctioned.

" Madras also shares very largely in railway extension.

" The Tramway Company's little line to Conjeveram, of which 19 miles will be re-laid on the standard gauge, is about to be extended 24 miles to Cuddalore. It will be re-named the 'Carnatic Railway,' and in respect to guarantee will be placed in the same position as the other railways in India.

" It is hoped that a branch of this line will be made to Pondicherry, and the French Government have already expressed their desire to assist in the undertaking.

" Another line, 210 miles in length, from the present line to Tuticorin, is about to be constructed by the Great Southern of India Company. The surveys have been already undertaken, and it is hoped before long that the works will be commenced.

" In Burma surveys have been made from Rangoon to Prome, a distance of 168 miles.

" Investigations have been authorised, and from a communication received from the Chief Commissioner, it is hoped that advantage will be taken of converting the existing road into a line of railway.

" In Bengal surveys have been authorised under direct Government agency for determining the best lines; but it is distinctly understood that the Governments having authorised these surveys, does not settle the question that they are to be constructed by direct Government agency.

" Much progress has yet to be made in the extension of the Eastern Bengal Railway to Goalunda.

" The delay in the construction of this work has been mainly due to the unfortunate accident at the Gorai Bridge.

" Further north, beyond the Ganges, the Oudh and Rohilkhand Company are pushing on their works.

" The Cawnpore Bridge is rapidly approaching completion, and we hope that before very long the Ganges will be bridged for the first time.

" The designs for the erection of another great bridge across the Ganges at Rájghât have been approved, and the earthworks for nearly the whole of the system of the Oudh and Rohilkhand Railway have been marked out.

" We believe that this system of lines under the able direction of the officers of the Company is likely to be made more cheaply and with greater economy than any railway that has hitherto been made under guarantee in India; and General Beadle informed me the other day that, including the large bridges over the Ganges, he hoped that the average cost of the Oudh and Rohilkhand Railway would not exceed 11,000 £ a mile.

" A portion of this system includes the line from Moradabad to Ramnagar and the foot of the Himalayas, and running near the Kumaon Ironworks, about 45 miles in length.

" In the Central Provinces orders have been lately issued by the Government for the survey of the line which will convey coal and iron lately discovered in those districts, and we hope during the ensuing year the work will be actually commenced. The

Appendix, No. 3. surveys east of the Wurdah have already been completed; we hope before a month or six weeks are over we shall be in a position to decide with regard to the Oomraottee branch in the Berars.

“ But the two most important of the year in railway are those connected with the Hyderabad State Railway and the proposed railway to Indore.

“ I am sure the public have heard with the greatest satisfaction that two native governments have proposed to come forward and subscribe a million of money each for railway construction in their respective states.

“ Sir Salar Jung has already made financial arrangements to construct a branch line from Goolburga to Hyderabad entirely at the expense of the Hyderabad State, and though it will really be under British management and constructed by British engineers in a way similar to State railways, it will be essentially the property of the Nizam's Government, and before three years and a half are over, we may hope that the Hyderabad State will be in possession of a railway of its own.

“ The Mahārājā Holkar has also made a proposition of a different kind, but which will have precisely the same result. He has agreed to lend the Government at $4\frac{1}{2}$ per cent. a million of money to construct a line which will meet the Great Indian Peninsula system somewhere near Khundwah.

“ The financial arrangements in this matter have been perfectly satisfactory, and his Highness has proposed to place at the disposal of the Government of India more than half the amount in the first two years, the remainder being paid by instalments spread over a greater length of time.

“ There is therefore no reason to doubt that before very long we shall see in India two great railways in process of construction entirely by capital supplied by native states, one of which has determined to do the whole thing itself, and the other to place a sufficient sum in the hands of the Government to carry out the enterprise.

“ In many ways the Government are endeavouring to provide materials for the construction of those works which they are about to undertake, with, if possible, much greater expedition and less waste of time than has hitherto attended their action in this respect.

“ Attention has also been given to the provision of fuel; various investigations are being made in different directions with regard to coal and petroleum, which has been long known to exist in small quantities in the Panjāb and other parts of India.

“ We hope that the Nerbudda Valley and also the Chanda District will before long produce a large supply of coal; we have heard of the existence of a large quantity of coal on the Godavery, and we have every prospect that during the ensuing year, or 18 months, we shall be in a position to say that there is in this country a supply of coal sufficient to work a very large portion of the railways at present in existence as well as those about to be constructed.

“ Of course some districts will always be so remote that we cannot venture to hope that they will derive any very material benefit from this increase in the supply of coal, and for this reason efforts are about to be made in these cases to increase the supply of wood-fuel as much as possible.

“ It is very late, and had I more time I could have brought to your notice many other interesting facts with regard to this important matter; but I am satisfied that, even brief and imperfect as is the statement I have now made, it will attract some attention generally to this subject; and I can truly say that there is nothing the Government of India value more than public support in these gigantic undertakings, which have no other object but the general good of the people of this vast empire.”

The Motion was put and agreed to.

The Honourable Sir *Richard Temple* having then applied to his Excellency the President to suspend the rules for the conduct of business,—

The President declared the rules suspended.

The Honourable Sir *Richard Temple* then introduced the Bill, and moved that it be referred to a Select Committee, with instructions to report in a week.

The Motion was put, and agreed to.

CUSTOMS DUTIES' BILL.

The Honourable Sir *Richard Temple* then moved for leave to introduce a Bill to amend the law relating to Customs Duties.

The Motion was put, and agreed to.

The Honourable Sir *Richard Temple* then applied to his Excellency the President to suspend the rules for the conduct of business.

The President declared the rules suspended.

The Honourable Sir *Richard Temple* then introduced the Bill, and moved that it be referred to a Select Committee, with instructions to report in a week.

The Motion was put, and agreed to.

The following Select Committees were named :—

On the Bill for imposing duties on income and profits arising from offices, property, professions, and trades—The Honourable Messrs. Stephen, Forbes, Cowie, Chapman, Bullen Smith, Cockerell, and the Mover.

On the Bill to amend the law relating to Customs Duties—The Honourable Messrs. Stephen, Forbes, Cowie, Chapman, Bullen Smith, and the Mover.

The Council adjourned to the 5th April 1870.

Calcutta, 2 April 1870.

Whitley Stokes,
Secretary to the Council of the Governor General
for making Laws and Regulations.

Appendix, No. 3.

ABSTRACT of the PROCEEDINGS of the Council of the Governor General of India, assembled for the purpose of making Laws and Regulations under the provisions of the Act of Parliament, 24 & 25 Vict. c. 67.

The Council met at Government House on Thursday, the 9th March 1871.

PRESENT:

His Excellency the Viceroy and Governor General of India, K.P., G.M. S.I., presiding.
 His Honor the Lieutenant Governor of Bengal.
 The Honourable John Strachey.
 The Honourable Sir Richard Temple, K. C. S. I.
 The Honourable J. Fitzjames Stephen, Q. C.
 The Honourable B. H. Ellis.
 Major General the Honourable H. W. Norman, C. B.
 Colonel the Honourable R. Strachey, C. S. I.
 The Honourable F. S. Chapman.
 The Honourable J. R. Bullen Smith.
 His Highness Sarāmade Rājāhāe Hindūstān Rāj Rājendra Śrī Mahārājādhirāj Śivāi
 Rām Sing Bahādur, of Jaypūr, C. C. S. I.
 The Honourable F. R. Cockereil.
 The Honourable J. F. D. Inglis.
 The Honourable D. Cowie.
 The Honourable W. Robinson, C. S. I.

FINANCIAL STATEMENT.

INCOME TAX BILL.

THE Honourable Sir *Richard Temple* in moving for leave to introduce a Bill for imposing duties on income, said.—My Lord, I have now to present the Budget of British India for the year 1871-72, this being the Twelfth Annual Statement presented since the introduction of our existing financial system.

I shall commence by adverting to the form in which the Statement has been drawn up.

It will be recollected that in my exposition delivered before this Council on the 2nd April last, I explained the alteration made in the exhibition of the account of Government with the Guaranteed Railway Companies. By that alteration we showed on one side the amount of guaranteed interest payments, and, on the other side, the amount of net traffic receipts, instead of the former method, whereby only one item was shown, namely, the guaranteed interest less the net traffic receipts. In other words, we exhibited the account gross on both sides, instead of the expenditure net on one side. Well, the Secretary of State has determined, after considering all our representations in favour of the alteration, that we must still continue to exhibit the account as before by its net result on the expenditure side, that is, by one item, namely, "guaranteed interest less net traffic receipts." I have accordingly to exhibit the guaranteed interest net in the Statement itself. But at the foot of the statement there are appended figures showing the account gross in the method explained in my last financial statement, which method was, I believe, approved generally by this Council and by many others interested in this portion of our finance. Thus the important objects set forth in my last exposition will still be fully attained.

This modification will make no difference in the ultimate result of the figures as regards surplus and deficit. But it will make a difference in the totals of receipts and expenditure, that is, the deduction of an equal amount from both sides of the account. The grand totals, therefore, of the statement I shall make to-day will not admit of exact comparison with those of my Statement in April of last year. But the figures of surplus and deficit on this occasion and the last will be strictly comparable.

Also I explained in April last why we had transferred the canal water rent from the heading of public works receipts to the heading of land revenue. We have since determined, on a further review of all the circumstances, to exhibit these irrigation receipts separately. I trust that this growing item, now nearly half a million annually, will prove of general interest. Its growth is indeed anxiously awaited by us, in order that there may be some appreciable off-set to the fast-accruing interest on capital outlay.

Lastly, it has been considered proper to show again under one head the entire revenue raised by stamps, whether under the General Stamp Act or the Court Fees Act.

After

After this brief preface, I proceed to deal with the figures in the same order as that observed in all previous statements,—that is, firstly, the actual figures for the past year 1869-70; secondly, the approximate figures for the current year 1870-71, according to the regular estimate; and thirdly, the proposed figures for the coming year 1871-72, according to the budget. I shall take the figures from the combined statement for England and India in the same manner as I did last year.

I begin then with the past year 1869-70. The Council will recollect that the regular estimate for that year exhibited in my last exposition showed an anticipated deficit of income below ordinary expenditure of 625,594 £, or more than half a million sterling. The actual figures, however, now show a small surplus of 118,668 £. Thus the actual turns out more favourable than the estimated account by 744,262 £, or three quarters of a million. It is also slightly more favourable (by 57,796 £) than the approximately actual figures published in September last; this small difference being attributable mainly to the railway account. I shall explain briefly the causes of this fortunate result. The receipts of the year were taken in the regular estimate at 50,297,052 £; they have proved to be 50,901,081 £, showing a difference favourable of 604,029 £. The ordinary expenditure was estimated at 50,922,646 £. It has proved to be 50,782,413 £, showing a difference favourable of 140,233 £. The favourable difference in receipts is partly nominal, arising from certain items being shown gross which in the estimate were shown net; but chiefly real, arising from unexpected recoveries in the Military Department by the sale of stud cattle and by the adjustment of the value of supplies to the Abyssinian Expedition and to the civil departments and administrations, and also from a variety of small increases under several heads of revenue,—to wit, land, revenue, income tax, customs, salt, stamps. The difference favourable in expenditure arises chiefly in the military heading, the savings from the reductions of expenditure proving somewhat greater than had at first been hoped for; partly also from the amount of unpaid dividends and unclaimed allowances being more than was anticipated; partly, further, from various smaller savings in civil branches,—to wit, land, revenue, opium, administration departments, post-office, and police. In a word, the largest difference on the whole account (315,116 £) is attributable to the unexpected additional military recoveries and to the favourable financial effect of the military reductions which had been ordered.

Thus ends the financially eventful year 1869-70. The original estimate showed a small surplus of 52,650 £. As the year wore on, a large deficiency, arising partly from a fall in opium, and depression of trade, was anticipated. Various measures detailed in the last financial exposition were taken to avert the threatened deficiency. Still, as proved by the regular estimate, fears were entertained up to the close of the year that the deficit, though greatly diminished, would not be altogether avoided. The result, however, as shown by the actuals, proves that the original estimate has been more than fulfilled, the actual surplus being 118,668 £.

This result is owing partly to management, and partly to fortune. The management consisted in the measures adopted within the year by the Supreme Government and in the economies carried out by the local governments. The fortune consisted of a variety of adjustments and recoveries for the most part unestimated, bettering the account, on the whole, to the net extent of 866,580 £. I am constrained to make this remark because it seems to have been supposed in some quarters that we brought out the surplus lower than it ought to have been by a variety of debit adjustments made at the last moment. Now we certainly had to make a variety of adjustments (all of which were completed before the production of my last statement to this Council), thereby clearing once for all a number of long-standing and unsettled items from the public accounts. Some of these were on the credit, others on the debit side. After setting the latter against the former, the result was a net advantage to the account as just set forth. Thus the unavoidable operation was not, as has sometimes been supposed, at all unfavourable to the final out-turn, but actually favourable.

Further, if I have apprehended rightly, it seems to have been understood in some quarters that the favourable result just described shows that the measures taken during that year by the Government of India were, after all, not necessary, or that there may be difference of opinion as to their necessity. I will therefore declare for the last time that those measures were both just and necessary, and that there is not—there never has been—any difference of opinion in the Government of India on the subject. I showed in my last exposition that those measures bettered the account by 1½ millions sterling. Had it not been for them, therefore, there would have been a deficit of nearly 1½ millions, instead of the small surplus which I have the pleasure to announce to-day. It seems to me that this is as strong a financial justification of those measures as could reasonably be expected.

Further, I understand it to have been held in some quarters that the occurrence of this small surplus instead of deficit, for the past year 1869-70, does to some extent cut away the ground from under the measure of the increased rate of income tax for the present year 1870-71. I can admit, however, nothing of the sort. It is true that amidst an accumulation of many reasons for the enhanced rate of income tax, the anticipated deficit of 1869-70 was one. But the disappearance of this one reason does not at all affect the other and graver reasons. Among these reasons were the deficits of preceding years unfortunately beyond question, evincing unsatisfactory tendencies in our finance, which tendencies could only be stopped by fresh taxation. But the principal reason lay in the condition and prospects of the year 1870-71, to which I have yet to avert. The increased income tax was

Appendix, No. 3.

imposed for 1870-71, the estimate for which year was framed on data of its own, many of which were independent of the out-turn of the preceding year. Even if the actual figures of the year 1869-70 had been known, which was impossible, the prospect of deficit for 1870-71 would have remained unaffected in any essential degree. The surplus of one year cannot be carried over as it were to mitigate the prospect of deficit for the following year.

This brings me to the figures of the current year 1870-71. As the Council recollects, the budget showed a surplus of 163,440 *l.* The regular estimate now shows a surplus of 997,100 *l.*, amounting to a difference in our favour of 833,660 *l.*, of which I shall briefly explain the causes.

The receipts, omitting the net railway traffic receipts, were estimated in the budget at 49,479,585 *l.*; they are now estimated at 51,048,900 *l.*, showing a difference in our favour of 1,569,315 *l.* Of this increase, the main item is 1,074,519 *l.*, under the head of opium. The improvement of the opium receipts arises from the price of Bengal opium having been, on the average of the year, *Rs.* 1,121. 8 *a.*, or 112 *l.* 3 *s.*, per chest, instead of 975 rupees, or 97 *l.* 10 *s.*, per chest, as was first estimated; also from the quantity of Malwa opium having been 38,742 chests, instead of 33,600, as was first estimated.

In my last exposition, I gave to this Council the reasons why the opium estimates had been cautiously framed, namely, the actual fall and the further downward tendency of prices on the Bengal side, and the indifferent prospects of the drug on the Bombay side. The out-turn of the crops on both sides of India has proved, however, even better than was expected; and throughout the year the advices from China have been favourable. The improvement of the Indian opium trade in China must, of course, have had its causes, which causes may be connected with the condition of the indigenous culture of the drug in China itself; but what exactly those causes are, I hesitate to state to this Council. I may have my opinion and conjectures, but I really do not know, and I have not heard of any one who does know. Those nearest to the spot and best qualified to judge have not as yet been able to explain satisfactorily. All I can say now, therefore, is that we are carefully watching every indication afforded by each fact in detail as it becomes known. But I must add that assuredly, at the commencement of the year, when the last budget was prepared, we had no right whatever to reckon on the improvement which has occurred, and no sign or fact whatever to reasonably indicate that it would occur. Therefore, this stroke of fortune does not, in the least, shake my conviction as to the prudence and propriety of the moderate estimate which was made. Nor does it at all encourage me to relax the watchfulness and caution necessary in framing the opium estimates for the coming year.

Recently we have published a *resumé* of all the official information possessed by us regarding the growth of opium in China. The facts therein shown regarding the quantity and quality of the Chinese drug fully bear out what I stated in my exposition of last year, to the effect that the Indian opium trade with China is threatened with a serious competition. It appears that the culture of the poppy in China expanded in the years 1866 and 1867, and that the produce obtained in the summer of 1868 was abundant, and was nearly as good in the summer of 1869. After that, reports reached us of injuries to and failures in the Chinese produce of the summer of 1870. These were corroborated by the subsequent rise in the price of the Chinese drug. Now, is there any connexion, and if so, what, between these circumstances in China and the recent rise or fall of prices of the Indian drug? I really cannot answer these questions. There may be no such close or direct influence exercised by the Chinese upon the Indian drug. It may be said that the two drugs are consumed by different classes in China. The Indian prices must be affected by the increased supply from India itself; also speculation forms an important element in the case; and our experience of Chinese opium, on any considerable scale, is as yet but short, while the information obtainable from the interior of China is often tardy and uncertain.

There remain some items of increase on which the Council may desire a word of explanation. There is an increase of 92,508 *l.* under land revenue. This is due to a considerable improvement in Madras, apparently from the realization of arrears outstanding from previous years of drought.

The increase of 141,500 *l.* in customs has accrued at the ports of Calcutta, British Burma, and Madras, and not at all at the port of Bombay. This increase may, perhaps, surprise those who are not practically acquainted with the import trade. The major part of that trade, namely, the European piece goods, has not, despite large importations, been altogether flourishing, inasmuch as the sale of these important goods for the markets in the interior has not been so favourable to importers as we might have wished. It is feared that the improvement in customs is partly due to over importation which again may be in some respects connected with the abnormal condition of the European markets during this very eventful year. We may regret that the increase of the revenue does not yet indicate a corresponding improvement in trade. But the fact that such large quantities of goods have been taken (though at somewhat low prices) is an index of the prosperous condition of the people at this moment, and affords hope for the future progress of the trade.

The 72,000 *l.* of increase in excise arises in Northern India and Madras; the harvests having been good or abundant.

The increase of 144,510 *l.* in the post office is almost wholly nominal, owing to the fuller exhibition of the charges made against the various departments of the administration for official postage.

The increase of 289,226 *l.* in miscellaneous receipts arises from a large item (93,497 *l.*) of assets of the Ameen's fund at Bombay, long held in suspense, being credited to Government;

ment; from the current adjustments from the balances of the military and medical funds being larger than was anticipated; and from an arrear adjustment from these balances. The circumstances under which the assets and liabilities of these funds were transferred to the State, and the principle upon which the charges of each year are adjusted, were expounded in my last financial statement.

The increase of 166,775 *l.* in army receipts is owing to general augmentation under a variety of heads, such as sale of stores, malt liquor, and the like.

On the other hand there are some instances of diminution in receipts. One important item of decrease is that of 105,000 *l.* under the head of assessed taxes. This means that the 3½ per cent. income tax, together with some arrears of the preceding year, was estimated to yield 2,180,000 *l.*, and is now estimated to yield 2,075,000 *l.* The falling off chiefly arises from the circumstances of several of the tax-paying classes in Bengal, Bombay, and Madras having been less favourable, owing to the state of trade, than was expected. When the losses in trade are remembered, when it is also remembered that the more exact assessments under the new law and under the high rate were sure to be favourable to the taxpayers, and that the enhancement of a direct tax of this sort is sure to be met with a certain degree of passive resistance, I think that the out-turn of the tax for the year promises to be satisfactory, and to prove creditable to the several local Governments. We have constantly observed all the complaints that have been made regarding the assessment or the realization of the impost, and we have done all we could to prevent any just cause of complaint arising. We cannot venture to hope that no such cause has arisen anywhere, knowing, indeed, that in such a country as this regrettable circumstances may occur without coming to light. But it is noteworthy that on a circular being addressed by us to the several local Governments in India, inquiring whether there were any known cases of oppression or over-exaction, we received replies from all of them (except the Government of Bengal) to the effect that no such cases were known. The Government of Bengal indeed did transmit a *résumé* of some 13 cases; this number is, of course, a matter for much regret, though relatively it is not large.

Salt again shows a decrease of 72,870 *l.*, which is, however, more than counterbalanced by a decrease in the charges of 82,519 *l.* Less salt has been manufactured and sold than was expected, under the special arrangements at the Sambhur Lake in Rajpootana.

Another item of decrease is that of 107,670 *l.* in the Mint receipts. Very little bullion has during the year been presented for coinage, owing to the unfavourable state of the exchanges.

A further item of decrease to be noticed is that of 129,280 *l.* in the forest receipts. This arises from the consumption of timber by the railways having been less than was expected. The circumstance proceeds really from the State railway works not having been so vigorously prosecuted as was intended. There is, from the same cause, a diminution of outlay (51,540 *l.*) under the head of forests.

There are other small differences, some more, others less, which can be seen in the general sheet, but which I need not now stop to explain. The net result is an income of upwards of 51,000,000 *l.* sterling (51,048,900 *l.*) exclusive of net railway traffic receipts, which amount, if compared with corresponding amounts of previous years, transcends them all, and represents the largest revenue ever yet raised in British India.

Turn we now to the ordinary expenditure of the year. That was estimated in the budget at 49,316,145 *l.*; it is now estimated at 50,051,800 *l.*, showing a difference against us of 735,655 *l.* The causes of this difference also I shall explain.

There is an increase of 31,498 *l.* under interest on miscellaneous accounts by reason of the decision to allow interest on deposits of the Indus Flotilla; of 51,890 *l.* under opium by reason of the crop of 1870 proving larger than was expected, and of extending cultivation; of 45,917 *l.* under post office by reason of arrear payments in England on account of the mail service; of 14,325 *l.* under political agencies by reason of the postponement from last year to this year of a payment in England for the embassy to China; of 82,647 *l.* under superannuation and retired allowances, corresponding with an increase under miscellaneous receipts which I have already explained, and arising from the payments to the pensioners of the late military and medical funds proving larger than was estimated.

These are all minor items of increase. But there are three major items on which I must bestow a few moments; they occur under the heads of miscellaneous, of army, and of railways.

The heavy increase of 414,908 *l.* in the miscellaneous heading arises chiefly from what is technically termed loss by exchange. This is calculated on an assumed, though not an actual, basis of 2 *s.* to the rupee. We are under the obligation of providing annually a large sum in England in pounds sterling for the payments in that country on account of the Government of India. This provision is principally effected by the sale in London of bills drawn by the Secretary of State on the exchequer in India. The amount originally intended to be drawn by the Secretary of State during the year was 9½ millions sterling. The amount actually supplied during the year in England will be 9 millions, although with outstanding bills of past years we shall have to pay 9½ millions (9,525,000 *l.*) in India. Judging by the best information at our command, we estimated that the Secretary of State's bills would be sold at an average rate throughout the year of 1 *s.* 11½ *d.* for the rupee, which would have involved, on 9½ millions sterling, a loss by exchange of a little more than 300,000 *l.*, which was the sum provided. This of course was only a forecast of a matter on which foreknowledge was impossible. The actual supply of funds to the Secretary of State,

Appendix, No. 8. including the specie remittances to be presently referred to, has been effected at an average rate of only a little better than 1 s. 10 $\frac{1}{2}$ d. for the rupee, involving a loss by exchange of 600,000 l. In other words, we hoped to pay only 3·16 per cent. on the basis of the assumed par, for providing the money for discharging our obligations; in fact, however, we have had to pay 6·67 per cent. Judging by all past experience, we deemed our estimate moderate. But the great events in Europe have disturbed exchanges and caused this misfortune to us, which could not have been foreseen.

As part of the 9 millions sterling supplied during the year, we had, last August, to ship in specie from India to England about 62 lakhs of rupees (62,10,688 rupees), or 620,000 l. We were informed by the Secretary of State that his bills on India were, for the moment, unsaleable in London. It therefore became immediately necessary for us to remit specie wherewith to provide the means of discharging our current obligations in England. This was accordingly done with the requisite dispatch. The produce in England of these remittances was 571,812 l., or only a little above 1 s. 10 d. (1 s. 10·09 d.) per rupee; but the indirect effect of the operation upon the exchanges is believed to have been favourable.

A new item will be perceived in the regular estimate which was not entered at all in the budget, namely, that of allotments for provincial services, 200,000 l. This entry appears for the first time. It relates to the scheme set forth in our resolution of December last, entrusting to local governments increased financial control in certain departments, the provisions of which scheme I shall presently recapitulate. In order that the local governments may be able to inaugurate this plan successfully, and to have, as it were, a fair start, it is found most desirable to give them a special allotment of funds to begin with, in addition to the regular allotment they will receive year by year for the next and subsequent years. The regular annual allotments have been made on the basis of the budget grants for 1870-71. In fact, however, there have been savings effected in the current year on these grants, aggregating, for all India, perhaps 200,000 l., though the precise sum cannot be stated with certainty. Under all the circumstances, inasmuch as the savings have been effected in the current year, we have decided to make the special allotment from the resources of this year; and to fix the amount at 200,000 l., to be distributed rateably among the local governments, an arrangement which will, we hope, prove satisfactory to them.

The increase of 554,659 l. under the head of army has arisen partly in England and partly in India. The increase in England amounts to 361,859 l., and in India to 192,800 l. The increase in India is in overland transport charges, in furlough allowances, and for breech-loading arms. The overland transport system is a new one which is gradually developing itself, and of which it may be difficult in England to estimate accurately the cost beforehand. The increase of furlough allowances arises entirely from officers now drawing pay in England under the new system, who would under the old system have drawn larger allowances on duty in India. For the increased charge on account of the new breech-loading arms the Government of India willingly takes the responsibility, having made urgent indentations therefor.

The increase in India is due to the adjustment this year of a large sum on account of the charges for the overland troop transports defrayed in past years in India, which we had been led to suppose had been included in the home accounts. But for this arrear adjustment, the net charge for the army in India, which is even now only 72,735 l. more than the estimate, would have been less than was originally estimated by about 300,000 l. This is specially satisfactory in connection with the fact that the budget estimate for expenditure in India was for a large reduction over the preceding year.

The third item of increase is that of 319,517 l. under guaranteed interest on railway capital, less net traffic receipts. This arises from the net traffic receipts having fallen off; they were estimated at 2,848,470 l.; they are now estimated at 2,530,700 l. This diminution, again, does not arise from working expenses having proved greater, but from traffic earnings having proved less than the anticipation.

So much for the increases. On the other hand, there is a long list of diminutions arising partly from estimates having been prudently framed, partly from savings having been effected; these range at amounts from 500 l. to 100,000 l., and occur under the heads of interest, refunds, land revenue, forests, excise, assessed taxes, customs, mint, telegraph, administrations, minor departments, law and justice, police, marine, education, ecclesiastical, stationery and printing, and allowances under treaties. If this series of savings shall be sustained by the actual account, the result will be very satisfactory. The normal ordinary expenditure for public works has been kept well within budget limits. To this has been added an assignment of 40,000 l. to the trustees of the Indian Museum for the completion of the building: it was found necessary to make this grant for this important public structure, in order to fulfil, as nearly as practicable under the circumstances, the obligation imposed upon us by Act XVII. of 1866, to complete the Museum building by the 23rd of the present month of March 1871.

The saving of 141,710 l. under railways, is chiefly due to delay in taking up land for the Oudh and Rohilkhand line.

So much for the ordinary expenditure. Before quitting the current year's account, however, I must just advert to the extraordinary expenditure. For this 3,062,300 l., or three millions, were estimated to be spent, but only 1,146,800 l., or about 1 $\frac{1}{4}$ million, has been actually disbursed. The difference is largely accounted for by the unavoidable delay in prosecuting the State railway works, by reason of the pending questions relating to the gauge

gauge best suited for adoption. These questions having now been decided, we may hope to see the works more rapidly proceeded with. The extraordinary added to the ordinary expenditure makes up a total of 51,198,600 £, or 51½ millions.

Such are the figures for the current year 1870-71, so far as they are yet known; the estimate being based on the actual figures of 10 months for all, and of 11 months for a few of the main heads of income, of 10 months for all branches of civil expenditure, and of nine months for the Army and the Public Works Department. I must, however, remind the Council of what has been stated in former expositions, to the effect that the figures of the regular estimate are liable to modification by reason of the facts which may come out in the course of the remaining two or three months. These months are in themselves financially very important months, and in March the whole accounts of the year are completed and adjusted. The accounts of the year 1870-71 cannot be even approximately closed for nearly six months to come; so that, although we have omitted no precaution to obtain the best forecast now possible, we must not be surprised if the final result of the year differs considerably, even from the revised estimate now presented.

The main result now apparent is that as regards income and ordinary expenditure, the budget estimate showed a small surplus of one-sixth of a million, and that the regular estimate shows a considerable surplus of a million. On the one hand, it is observable that this satisfactory surplus is wholly due to the unlooked-for rise in opium; and that without this piece of good fortune on the receipt side, we should, apart from the special assignments for the Museum and for provincial services, have had a little less than the surplus of 163,440 £ originally estimated. On the other hand, it is equally observable that on the expenditure side there has been a piece of ill-fortune, namely, the heavy loss by exchange, produced by great events beyond the reach of ordinary calculation. Thus, if the argument of fortune be pressed upon us, I should reply that if there has been an extraordinary increment of a million on the receipt side, there has been also an extraordinary increment on the expenditure side; and that if the one point be set against the other, there would still be a surplus in our favour of more than half a million,—that is, a surplus somewhat above that which was originally estimated—in fact, just the amount of surplus which is necessary for safe and sound finance, and no more. This perhaps is the fairest light in which to regard the situation at this moment. And certainly, if these two items be excluded, the general conformity of the regular estimate with the budget is highly satisfactory, both as regards receipts and expenditure, and more especially as regards expenditure, which in India has been kept well within bounds.

But in regard to the (perhaps unfortunately) cardinal importance of the opium revenue to our general finance, let us for a moment consider what would have been the situation had the opium increase of 1,074,519 £ not accrued. Why the consequence would have been that, apart from the exceptional allotments of 200,000 £ to the local governments wherewith to begin the provincial service scheme, and of 40,000 £ to the trustees of the Indian Museum, I should have to-day shown a surplus of 162,581 £, or almost exactly the sum originally estimated, viz., 163,440 £. And this circumstance does, to my mind, prove conclusively the justice and necessity of the financial measures proposed in my last exposition, and subsequently adopted by this Council for the current year.

When I say this, the mind of the Council will revert to the enhancement in the rate of the income tax. I apprehend that in some quarters it will be held that the present anticipation of a considerable surplus proves that the increased rate of income tax was, after all, not necessary; but I cannot, in the least degree, admit such an argument.

I have just explained that by one way of viewing the extraordinary circumstances of the year (which is a more favourable view for such an argument), we should only have had a moderate surplus, nearly the lowest amount compatible with safety and efficiency. By the other way of viewing the case (which is probably the more correct way), we should, without the opium increase, have had just the small surplus originally estimated. Therefore the argument, to my apprehension, turns on this question,—was the opium estimate in the budget a fair and prudent one, according to the knowledge available at the time? Has anything since transpired which may reasonably prove that estimate to have been too low under the circumstances wherein it was made? If that estimate was fair and prudent, then there is no ground whatever for impugning the justice and necessity of the enhanced income tax. When I say this, however, I by no means mean to admit that the justification of the income tax solely or even mainly rests on the opium estimate. For, even without this consideration there were various and manifold reasons in justification of that measure.

But I consider that if the opium estimate be proved to have been reasonable, then any attack on the financial necessity of the enhanced income tax for the year must inevitably fail. I here advert to financial necessity, without at this moment adverting to political or other considerations. Now, what were the circumstances under which the opium estimate was framed? Let me remind the Council of the reasons adduced, in my last exposition. It was then shown that there had been a heavy fall in the price of Bengal opium; that, for a whole year the decline had been almost regular and constant; that the tendency was still downwards: that a mass of information had been received from China, indicating that the Indian drug would be subjected more and more to disadvantageous competition; that every practical authority whom we had been able to consult both in China and India, considered that nothing but decline could be anticipated. I affirm that when our Bengal estimate was produced, it was considered not at all too low, but quite high enough in non-official circles, where practical knowledge is in this respect most available. Indeed the most sanguine estimate suggested to us by any one was only 122,500 £ in excess of that which we actually adopted. As regards the Malwa opium, the facts were almost as unfavourable. Our

Appendix, No. 3.

estimate, though realized in the end, had been a constant source of anxiety through the year. The local authorities had been constantly warning us of expected deficiency. The then prospects of the crop were not propitious. On a retrospect of the whole case, I am quite convinced that no higher, indeed no other, estimate could have been properly framed than that which was framed; and that being so, I have only to reiterate all the arguments adduced in my last exposition, to the effect that without the income tax at the 3½ per cent. rate we must have produced a budget with a large deficit, and that therefore the imposition of that tax was a matter of financial necessity at that time.

As regards the surplus above shown for the current year, we must remember that it is only anticipated as probable, and not yet actually realized. It may even yet fail us more or less; but if it shall be fully sustained by the ultimate event, it will be most gratifying, and will occur, indeed, not at all before it is needed. In my former expositions, I have shown that although, since the establishment of our financial system, the course of our finances has been certainly in many respects, and perhaps on the whole, satisfactory, still deficit has been too frequent, and surplus too rare. Of late years, especially while curtailing our ordinary expenditure, we have been incurring, and preparing to incur, a liberal and extraordinary outlay in improving our great national estate, for which purpose the national debt is being added to. Now, if ever, then is the time to secure a surplus of income over ordinary expenditure. Now is the season to prove, if we can, that we possess the determination and the means for keeping our income slightly in excess of our ordinary expenditure. We had scarcely dared to hope, indeed, that so good a result would be obtained within this very year, even after all the exertions that have been made. If it be obtained, however, as now seems probable, then the circumstance will afford cause for nothing save congratulation; and we need never regret the efforts which have been made and the sacrifices which have been undergone.

But the existence of surplus for now two consecutive years, though not at all disturbing the reasons for the strong measures which have been adopted, does yet afford reasons for some relaxation of these measures in the coming year. And this remark appropriately brings me to the third part of my subject, namely, the budget for the year 1871-72 shortly to commence.

Before entering into details, I must however draw the attention of this Council and of all others interested in our finance to an important modification in the form of the statement for the year 1871-72. This modification has been made in order to give effect to the Financial Resolution by the Government of India of the 14th December last. It will be remembered that by that resolution an increased degree of control financially was accorded to the several local Governments in India, in certain civil branches, to wit, gaols, registration, police, education, medical services, printing, roads other than military, and civil buildings. We hope that this concession will give the local governments an additional interest in the study and the enforcement of economy in expenditure; will afford them a just inducement to supplement their local receipts from time to time by methods either most acceptable to the people, or least fraught with popular objection; will cause a more complete understanding to arise between the executive authorities and the tax-paying classes respecting the development of fiscal resources; will teach the people to take a practical share in provincial finance, and lead them up gradually towards a degree of local self-government, and will thus conduce to administrative as well as financial improvement. The hopes which I am expressing, however sanguinely or confidently entertained, are, after all, but hopes, and, like all other hopes, may or may not be fairly realised. But let all this eventuate as it may, sure I am with certainty free from shade of doubt, that the measure is advantageous to the Imperial budget of British India. For it it will have the direct effect of definitely limiting, for the present, the expenditure from the general exchequer on certain important branches of civil expenditure, the very branches indeed where, from the progressive spirit of the age, the demands for increased outlay have most arisen, and would most arise, and in which, from the nature of the case, the supreme central authority is least able to check the requirements of the local authorities.

We have indeed, at the outset, inaugurated the measure by reducing the aggregate expenditure under these heads by one-third of a million (331,038 *l.*)* below the budget grant of 1870-71. This is, *per se*, something appreciable of course. But greater far financially is the advantage of setting some definite bounds to the constant growth and expansion of Imperial outlay on these branches, of which the use and importance, though great indeed, are yet local rather than Imperial. The more we consider the constant increases of late years in these particular headings; the difficulty which the Supreme Government has in resisting demands which have so much inherent excellence to recommend them; the desire which we all naturally feel to co-operate, so far as possible, in meeting such reasonable requirements; and yet the impossibility of meeting them unless local income can be legitimately and equitably augmented, the more do we perceive the importance of the financial principle (irrespective of administrative and general considerations) embodied in the resolution of December last.

And the principle is in this wise. The local governments are to have a fixed annual allotment from the general exchequer for these particular services, and are to appropriate as local income all receipts connected therewith. They are to regulate (subject to certain general

* The reduction appears, *prima facie*, to be 350,000 *l.*; but the share which would have fallen upon Burmah (18,962 *l.*) has been restored, so that, after rounding the figures, the net retrenchment from all the local Governments aggregates only 331,038 *l.*

general rules) all the expenditure on those services. If the existing income, namely, imperial allotment, *plus* departmental receipts, shall suffice for the requirements of that expenditure, then that is well; if it shall not suffice, then the local Governments are not to apply to the Government of India for increased grants. They must raise what they need by local taxation, or by such like means (subject to our central control) if they fairly can. But if they find that they cannot fairly manage this, then they must necessarily do without the increased expenditure. However much the necessity for doing without the increase may be regretted, there is no help for it. This is the only way of following the good old rule of cutting coat according to cloth. However important progress and improvement may be, financial safety is more important still.

I have seen it stated in some quarters that this new measure, by limiting the aggregate allotment for certain services, tends to deprive the local Governments of any benefit that may arise from increase of the revenue, and to secure all such benefit for the Supreme Government exclusively. I need hardly say that any such allegation is based on misapprehension; as if the Supreme Government had any separate domains or estates or appenages of its own, in which the local Governments had no particular concern? The Supreme Government has no interest separate from the interest of India generally, or from the aggregate of the interests of the several local Governments. The new measure, after all, deals with a part, and that a small part (about one-sixth) of the total civil expenditure. There still remains by far the greater part of this expenditure, under the central control, including such branches as law and justice, the fiscal departments and the departments of general administration, as before, for all which expenditure grants are made to the local Governments. If the revenues increase, there will be benefit to these branches, whether it be in the enhancement of pay, in the expansion of departments, or in new outlay, all which benefits will be felt directly by the local Governments. If it be hereafter possible to increase the grant for public works ordinary, to whom will the increase be allotted? Why, to the local Governments. If it be found practicable to pay more and more interest on loans for public works extraordinary, in what territories will these works be executed? Why, in the territories under the local Governments.

The Council will perceive that the total amount of allotments for provincial services, as just defined, for all the local Governments together, is set down in the expenditure side of the budget for the coming year at 4,799,300 £, or 4½ millions, which amount I shall explain further presently. Meanwhile, I may observe that the total sum allotted for provincial services is thus distributed:—

	Receipts Surrendered.	Assigned from Imperial Funds.	TOTAL.
	£.	£.	£.
India - - - -	9,800	26,700	36,500
Oudh - - - -	14,700	211,300	226,000
Central Provinces - -	24,000	269,600	293,600
Burmah - - - -	28,600	276,500	305,100
Bengal - - - -	264,400	1,197,000	1,462,700
North Western Provinces	110,000	635,000	745,000
Punjab - - - -	67,400	528,800	596,200
Madras - - - -	81,800	752,300	834,100
Bombay - - - -	55,300	901,200	956,500
TOTAL - - - £.	656,400	4,799,300	5,455,700

The item opposite to "India" in the above list is for the Calcutta University and for provincial services (not including public works) in Coorg, Ajmir, and other districts of which the administration is immediately under the Supreme Government. The figures differ somewhat from those appended to the resolution of the 14th December, owing to the more complete transfer of the charge for medical services than was then proposed; to the inclusion in provincial services of the expenditure for petty construction and repairs in all departments, excepting opium and salt; to the promised additions to the grants in respect to the more stringent system of official postage; and to certain minor corrections of the figures.

The statement which I have given just now presents the total allotment to each local Government for all the services specified. Within this limit each local Government may (subject to the general conditions under which the additional control is confided to it) distribute the amount among the several services, making transfers, if necessary, from one to the other.

These allotments have been fixed on the basis of the budget grants for 1870-71 (after the deduction of the 331,038 £, rateably distributed). The objections which might be urged in detail against this mode of fixing the allotments have not, indeed, been overlooked. But certainly any other method that could be devised would have stirred up controversies and difficulties which might never be determined, and which would have caused an indefinite postponement of the whole measure.

If it were urged, too, that the grants for 1870-71, having been very economically fixed, afford too low a standard for future allotments, we should reply that these grants were

Appendix, No. 8. really as much as we could possibly afford, and that we are not likely to be able to afford more for some time to come.

In addition to these allotments, the local Governments will have the special assignment of 200,000 L., already explained, to begin with.

I have stated that the regulation of the expenditure in these branches is to be confided to the local Governments, subject to certain general conditions. The effect of those conditions is briefly this, that, without the previous consent of the Government of India, no new appointment above a salary of 250 rupees per mensem is to be created, nor old salaries raised beyond that amount; that no class or grade of officers is to be created or abolished, and the pay of no class or grade of offices is to be raised; that no addition or alteration is to be made, as regards pay and allowances, in the provincial departments of any province which might lead to inconvenience in the imperial departments or in other provinces.

The principle of these conditions is that whatever be the degree of control conceded to the local Governments, as regards amount of expenditure and strength of establishments and the like, the regulation of salaries, of rates of pay, even the lowest, of allowances and pecuniary privileges, must remain with the Supreme Government. Strictness in this respect is essential. Connected by the interchange of information as the several provinces of India necessarily are, whatever affects the interests of the public servants and establishments in one province, becomes known in all the others. If anything be conceded in one place, applications for similar concessions are sure to be made from other places in a manner difficult to be resisted. If pay be raised in one department, expectations of similar augmentation are apt to be created in other departments. This consideration becomes of special moment when certain departments hitherto imperial become local, while other departments continue imperial; not, indeed, that uniformity of pay and allowances is necessary for all departments and all establishments alike; nor even that such uniformity is essential for the same department (for instance, police or education) all over India. There may, indeed must, be variations in the several parts of India as regards system and organisation; there will also be differences in prices, in values, and in such like matters; and these circumstances will lead to differences in rates of remuneration; all which the Government of India has always acknowledged and allowed for. Still the check of the Central Government is indispensable to prevent these differences from becoming excessive and leading to financial embarrassment. It is clear then that in making these concessions to the local Governments, we have not parted with any of those powers which are needed for the preservation of financial order throughout India.

I have stated that we have made over to the local Governments the receipts arising in these particular departments. These consist, in the Gaol Department, of the proceeds of prison manufactures and the like; in the police department, of payments by municipalities and railway companies, sale of old stores, and so on; in education, of school fees, sale of books, &c.; and in registration, of the fee proceeds. These several receipts which have been previously included in our imperial sheet are excluded from the budget I now present, and transferred to the category of local funds: they will hereafter be accounted for in the provincial statements. The aggregate is indeed considerable, and amounts to nearly two-thirds of a million. They are, however, in their nature local, and are analogous to the funds which have been always held local, and excluded from the imperial account. They are essentially different from the imperial heads of revenue and receipt. When they are assigned to the local Governments, there is no deviation from the principles which have always governed our finances, to the effect that all heads of State revenue are held as imperial. No attempt has been made to assign to those Governments any branch of the revenues, as that would be a matter attended with difficulties into which I need not now enter. It was intended that an abstract of the estimates of the local Governments on account of provincial services should be presented to the Council with the imperial figures: this will be done in future; but it has been found possible to prepare it this year.

Before quitting this topic, however, I would venture to repeat what I stated before this Council in the budget debate of last year, namely, that too much must not at the outset be expected from the local Governments in consequence of any measure of this kind. After all, those Governments will have no golden road open to them, which is not already open to them in a considerable degree at least. To secure financial benefit, either they must reduce expenditure, or improve existing receipts, or impose new taxation. Now, as regards reduction of expenditure and improvement of existing receipts, they doubtless do already make constant efforts in both these directions. It remains to be seen whether they can put forth more efforts. As regards new taxation, they may do more in that way, but great caution will have to be exercised.

How the several local Governments will deal with their respective shares in the retrenchment of 331,058 L. from the grants of 1871-72, and how they will provide whatever additional sums may be required for the finance of the services now entrusted to them, is more than I can say at present. It is, however, clear that they have to some extent already made up, or are making up, their quotas of the retrenchment by savings and reductions of expenditure, a method, in my opinion, the most satisfactory of all. It would be premature to state the precise amount of such savings; but, on the figures now before me, I make out, as already said, that the said savings will probably amount in 1870-71 to 200,000 L., and there seems no reason why the expenditure for 1870-71 should not at least suffice for 1871-72. There will, however, be some fresh local taxation, more or less, in many parts of the country. In the Madras Presidency, as the Council knows, Bills for municipal and local taxation were, a few days ago, unanimously passed by the local Legislature.

ture. In the Bombay Presidency, the matter is still under consideration. In Bengal proper, the final decision of the Government of India, approved, after full discussion, by the Secretary of State, has been communicated to the Lieutenant Governor, to the effect that land and other property are to be rated for the support of roads and education. The local Government is still in communication with the Government of India as to the best way of carrying out this decision. In the North West Provinces, the Punjab, and Oudh, the local Governments have matured plans for provincial imposts, and bills to carry out these plans will be immediately submitted to this Council.

The Government of India has certainly borne in mind, and we believe that the local Governments also remember, the necessity of caution and moderation in the levy of provincial taxes. We have been, and are, most averse to the imposition of any new taxation that can be avoided. It was this consideration that induced us to lower the retrenchment to 331,038*l*. Our demand at first stood much higher; we reduced it in order that the burdens of the people might be abated, and that the local Governments might be spared the necessity of imposing any but the lightest, and most manifestly equitable, provincial taxes.

I now proceed to the figures of the budget for 1871-72.

The receipts are taken at 49,098,900*l*., or 49 millions, as compared with the 51 millions of the year just about to close. The amounts taken for the main heads of receipt, namely, land revenue, excise, customs, salt, stamps, closely follow the regular estimate for the current year. A moderate improvement is anticipated under land revenue, salt, and stamps. Considering the favourable out-turn of the customs for the current year, which is quite as much as, or even more than, we could have expected, we have not ventured to estimate a further increase for the coming year.

As regards the state of the foreign trade of India generally, I stated in my last exposition that 1869-70 (speaking on returns for eight months) would prove to be a year of retrogression after several years of satisfactory progression. The result has shown a decrease of five per cent. in value as compared with the preceding year. This reduction is, however, mainly due to a reduction in the tariff valuation, so that on the whole the real decrease was but slight. The total value of the trade is taken at 100½ millions sterling. For the current year 1870-71 there may be some improvement. The condition of the principal import, viz., piece goods, has been already noticed. Among the exports, jute (fibre) continues to flourish, the yield of the last crop having been abundant. Last year there were 3,361,852 or 3¼ millions of cwts. exported; in the current year, the export will be greater. The cotton export of 1869-70 amounted to 1½ millions of bales (equal to 555 millions of lbs.), being less than that of the preceding year. There seems likely to be as yet a further falling off this year, 1870-71, of this staple quantity, though not in value. We bear in mind the consequences, so important to India, likely to arise from the revived and increased production of the article in the United States of America. In 1869-70, there were 12½ millions of lbs. of tea exported from India; this year the quantity will be somewhat less. Last year there were 36 millions of lbs. of coffee exported; this year the quantity will be greater. Last year 98,000 cwts. of indigo were exported; this year the quantity will be about the same. There are now eight months' returns in the current year available. Judging from them, we are led to anticipate that the foreign trade of the country will rise to more than 100 millions sterling in value. As regards goods, indeed, there is a clear increase both in exports and imports; but there is a marked falling off in treasure. Last year 14 millions sterling of treasure were imported; this year only four millions were imported in the first eight months.

We have not overlooked a subject adverted to in my last exposition, namely, the remission of the export duty on Indian and Burmese rice. But, considering that there has been all through the current year an improvement in this branch of trade, and an increase in the yield of the duties, we are not prepared, under present financial circumstances, to propose any change.

The opium estimate is taken at a little more than the amount which we are receiving for the current year, or just over eight millions gross. The current year has, indeed, as already seen, been in this respect prosperous beyond expectation. We hope that the circumstances of the time warrant us in anticipating a fair amount of prosperity for the coming year. The advices from China are favourable on the whole. The prices in both the Indian and Chinese markets are, despite fluctuations, fairly satisfactory. For Bengal, we are not able yet to announce the exact number of chests that we expect to sell, but we have 41,012 chests actually secure in our warehouses. The precise number of chests which we shall sell in 1871-72, in addition to the above stock, depends upon the number of chests which we may resolve to offer for sale in the calendar year 1872, which again depends upon the out-turn of the crop now about to be gathered. At the last moment, I regret to say that the weather in the opium-growing districts of the Bengal Presidency is reported to have been of late somewhat unfavourable to the ripening crop. The area under cultivation this year is, however, larger than that cultivated last year, and we entertain hopes that the produce may at any rate not be less than last year's crop (54,072 chests provision opium). For the chests that we may sell in 1871-72 we have assumed an average price of 1,075 rupees, or 107*l*. 10*s*. per chest. The average price per chest in 1870-71 has been *Rs.* 1,120. 8. (112*l*. 1*s*.) per chest. The latest sale has produced 1,169 rupees (116*l*. 18*s*.) per chest. On this very important point, the estimate seems to be prudent, and leaves a margin for fluctuations not now foreseen. For Mulwa, the duty being fixed (660 rupees a chest), the real point for forecast is the number of chests likely to be exported. The number in

Appendix, No. 3. 1869-70 was 39,371 chests; that in 1870-71 will be probably 38,742 chests. We have estimated for 1871-72 as many as will bring the total number of chests (Bengal and Mulwa) to 90,000, no doubt a full number, quite up to the average of recent years. But the prospects of the present crop in Mulwa are reported to us by telegraph to be up to yesterday excellent; we are selling this year a much larger provision of Bengal opium than we sold last year; and if the quantity be taken at a full estimate, still the price assumed for Bengal is apparently a moderate one. As a whole, the estimate will, I hope, be considered moderate.

The increase (113,900 £) in the forests estimate allows for increased consumption of timber in the construction of the State railways, partly counterbalanced by increase of expenditure (65,100 £) on the other side of the statement.

The increase (19,400 £) in telegraph arises from improved receipts on the Indo-European line *via* Persia and Russia, which has been working with marked efficiency throughout the year. The recent increase in the tariff of both this and the sub-marine line is to be regretted, but I fear that it will be found to have been absolutely necessary to render the continuance of the two alternative lines (so desirable for securing our communications) financially possible. At present the Indo-European line appears to be outstripping its rival in the Red Sea.

The low estimate of mint receipts is owing to the state of exchanges, which may, we fear, not recover sufficiently for much bullion to be presented for coinage. Our mints are unfortunately at present in a condition of enforced inaction.

A diminution is shown in the estimate for miscellaneous receipts, because we do not expect any such arrear adjustments as those whereby this item is swollen in the current year.

The items of decrease under the heads of law and justice, police, and education arise from the transfer of the receipts of gaols, registration, police, and education to local funds in the manner I have already described to-day. All the items transferred amount to a total of 656,400 £.

The Post Office shows a decrease of 29,500 £, the receipts this year having been unduly swollen owing to some misunderstanding by the civil departments of the Post Office rules. The receipts might have been, by this time, greater perhaps than they are, had it not been for the concession to the public of carrying half a tola in weight instead of a quarter tola, for half an anna postage. The change, however, has not caused any actual loss of revenue. This result is, of course, owing to an increased number of letters. Two years ago I stated the number of covers of all kinds annually received by the Post Office in India at 70 millions. It has now grown to nearly 95 millions.

In respect to the telegraph receipts, I may observe that the reduced rate of one rupee for a message of 10 words to any part of India has worked so far successfully as to cause an increase already of more than 50 per cent. in private telegrams; but it has not yet caused such an expansion of telegraphic communication as to bring about a financial success. The total number of messages dispatched in India by the Government Telegraph, and by the Railway Telegraph for the public, does not exceed 700,000 annually, a number which is very small for so large a country as this.

The head of Assessed Taxes I shall reserve for separate notice hereafter. The Council will perceive that it shows a decrease of 1,475,000 £.

It will hence be apparent that the Budget Estimate of receipts compares favourably with the Regular Estimate of the current year. If the receipts now transferred to the local Governments had remained as before, and if the assessed taxes had been retained at the same rate, then the total for the year, instead of being 49,098,000 £, would have been 51,230,300 £, or 51½ millions; as high a figure as has ever been presented. The diminution, then, in the present total does not indicate any diminution whatever in our real resources.

I now come to the ordinary expenditure of the year. This is estimated at 49,005,500 £, or just 49 millions, showing a reduction of 1,046,300 £, or one million below the estimated expenditure of the current year. This result is, *prima facie*, satisfactory. There are several important points in the figures, however, which I must briefly notice. Before doing so, I will clear off some of the lesser points.

In the first place, it will be observed that there are various small increases under headings relating to the collection of the revenue, namely, land revenue (120,500 £), forests (65,100 £), excise (21,400 £), salt (46,200 £), opium (37,990 £), which do not arise from any permanent accession to establishments, or such like expenditure, but from temporary measures leading directly to a pecuniary return, as, in land revenue, for re-assessments; in forests, for bringing additional timber to market; in salt, for expenses at the Sambhur Lake; in opium, for extension of cultivation; and so on.

We do indeed always accede to well-considered applications for grants for re-assessment of the land revenue, an operation which generally, though not always, leads to increase of income. Our notice has been attracted to the apparently slow progress, despite considerable outlay, in the re-assessment of the land revenue of the Punjab, a delay which seems prejudicial to the fiscal interests. This is a matter peculiarly within the province of the local Government; the point, however, has our attention.

The increase (95,200 £) shown under stamps and stationery, is due to the exhibition of the charge for stationery for the first time under this head. The increase of 74,200 £ under administration is chiefly owing to the transfer of the charge for the printing establishments of the Supreme Government to this head. It is not thought expedient to maintain a separate

rate head of stationery and printing for this item, and for the cost of stationery alone. Provision has also been made for the contemplated department in the Government of India for revenue, agriculture, and commerce, the creation of which is not expected to add ultimately more than 2,000 L. to the cost of the establishments of the Supreme Government.

The decrease shown under the heads of law and justice (535,300 L.), of police (2,269,500 L.), of education (806,200 L.), of medical services (334,800 L.), of printing (284,100 L.), of public works ordinary (1,575,800 L.), arises from the charges for these services being in whole or in part transferred, under the arrangement I have to-day described, from these several heads to the new head of allotments for provincial services, which head appears for the first time in our statement. The services of police and education having been transferred wholly, disappear from our statement. The heading of stationery and printing also disappears; printing becoming henceforward almost wholly a provincial service, and stationery being transferred, as above explained, to stamps. The headings of law and justice, of medical services, and of public works, have been only partially transferred. The decrease shown under law and justice relates only to gaols and registration; that under medical services to those establishments pertaining to civil stations, to dispensaries, and to sanitation, which are immediately under the local Governments, and that under public works to roads other than military, and civil buildings, with their due proportion of establishments.

The decrease under miscellaneous is due chiefly to our being able, in consideration of peace happily restored in Europe within the last few days, to estimate for a rather more favourable rate of exchange than we have had to meet this year. The rate we have taken is 1 s. 10½ d. for the rupee, giving, upon a supply of nine millions sterling, a nominal loss of 494,500 L.

We have not found it convenient to arrange for proceeding with the general census of India at present.

The increase of 70,200 L. for interest relates to the loan provisions for the two years, which I shall notice separately hereafter.

The new head of allotments for provincial services (4,799,300 L.) comprises the imperial assignments made upon the basis of the grants of 1870-71, to the several local Governments in India for gaols, registration, police, education, medical services, printing, roads, and civil buildings, and their connected establishments, less the amount of provincial receipts under these heads, which receipts have been surrendered to the local Governments.

The expenditure for the army is set down at 15,984,000 L., showing a decrease of 316,000 L. Of this decrease 270,000 L. occurs in India, and 75,500 L. in England; in fact, it for the most part occurs in India, and mainly for this reason, that no out-standing amounts, such as have had to be charged in the current year for the overland transports are expected in the coming year.

In my last financial exposition, I stated what had been done regarding military reductions. I added that our recommendations for reductions in the artillery and the native army were under the consideration of Her Majesty's Government in England. During the current year progress has been made with both these important questions, which necessarily involve doubtful or controversial points. After discussion, we have submitted our final proposals. We now estimate a saving of nearly 70,000 L., by a reduction of five batteries of horse artillery and three garrison batteries. But in this, as in other cases, the reductions are so managed as to cause no diminution in effective strength of European soldiers. Under all the circumstances, we have felt justified, moreover, in estimating a reduction of 100,000 L. in the expenditure on the native army for the coming year. On the other hand, we have been obliged to allow increases for camps of exercise, for military instruction, and for the manufacture of ammunition. On the whole, the amount estimated in India for 1871-72, namely, 12,410,000 L., is the lowest amount that has been taken for any year since the war of the mutinies.

Though the military charges in England do not show a further increase in the coming year, their growth of late years has not escaped our notice. It has occurred under the heads of overland transports, of furlough allowances, and of stores. The increase in furlough allowances in England, arising from officers drawing furlough pay more than heretofore in England, instead of in India, is mainly apparent, being counterbalanced by decrease in India. The increase in stores is for the new breech-loading arms, and is so far not to be regretted, the importance of the arms being too manifest to require explanation. The only item which causes anxiety is the overland transport service, which, however advantageous, does seem likely to cause a permanent augmentation to our expenditure. Attention is being given to the matter. I may add that the important head of retired allowances does not at present show any increase. Whether it is, or is not, likely to increase in future, is a question on which we have submitted our views to Her Majesty's Government in England.

The expenditure proposed for public works ordinary amounts to 2,365,000 L., or 2½ millions. In my last financial statement I explained the reasons why the grant for this branch, once so large, has been reduced to four millions. It is now nominally brought down to 2½ millions by the transfer of 1½ million to provincial services, as already explained to-day. There have been also some further retrenchments from the grants. For the laying out of the 1½ million annually, the several local Governments will in future answer. The

Appendix, No. 2. 2½ millions now remaining under the general control of the Government of India consist of—

	£.
Military - - - - -	1,012,500
Civil Buildings - - - - -	150,700
Roads and Communications - - - - -	115,900
Miscellaneous Public Improvements - - - - -	25,600
Agricultural - - - - -	454,900
Establishment and Tools and Plant - - - - -	605,400
TOTAL - - - - -	£. 2,365,000

These important grants manifestly stand very low,—lower indeed than they have been for years past, and almost as low as can reasonably be expected. The grant for military buildings includes the completion of those new double-storied barracks which had been commenced. In my statement made in March 1869, I went, at some length, into the subject of these barracks. Since then the execution of the scheme has been somewhat delayed from several reasons. It was found that in some places the existing accommodation for the troops was sufficiently good to allow of the new buildings being postponed at a time of financial exigency. There are plans for placing an increased proportion of the troops at hill stations, to some slight extent reducing the need of accommodation in the plains. In some respects, too, there arose doubts as to the suitableness of the designs of the new structures. The expenditure therefore on new barracks has been comparatively small (401,558 £.) during the current year, and will be only 436,533 £. during the coming year. I need hardly add, however, that the important subject of providing the best obtainable accommodation for the European troops is one which has our constant attention.

The item of establishment, already reduced, may perhaps alone admit of further reduction.

I gather that it has been supposed by some that public works expenditure has been maintained unduly high of late. But the Council can judge whether any such supposition could be supported by these figures. Surely no one will be found to say that the 1½ million allotted to the local Governments is too much. And as regards the 2½ millions remaining under the Government of India, surely no one can justly say that the amount is not moderate, considering the several services and the various provinces in which those services occur.

The net amount which the country will have to pay to the railway companies on account of guaranteed interest is set down for the coming year at 1,856,900 £., or upwards of 1½ million; about the same amount as that which is being paid during the current year. These amounts are no doubt formidable, and are the heaviest ever yet presented in our statements. The steady accretion year by year of these payments does indeed afford matter for reflection. The main cause is the growth of our gross guaranteed interest. On the one hand; this gross amount grows yearly in England; last year, 1869–70, for instance it was 4,176,008 £.; next year it will amount to 4,638,600 £., an increment of nearly half a million within two years. On the 31st March last the total capital outlay stood at 83½ millions (83,444,147 £.) out of a total capital subscribed of 86½ millions (86,522,491 £.); on the 31st December it stood at 86½ millions (86,525,000 £.), the total amount subscribed being 89½ millions (89,460,000 £.). We have now nearly 5,000 miles of guaranteed railways open, besides 1,000 miles sanctioned or under construction. On the other hand, the set off in India, namely, that of the net traffic receipts, does not grow at a corresponding rate; just now indeed it is hardly growing at all. Last year it amounted to 2,628,944 £.; this year we seem likely to receive only 2,530,700 £., and next year we expect 2,781,700 £. It seems to be not so much that the working expenses are unreasonable after allowing for new lengths of line opened—though no doubt there is room for economy;—it is rather that the traffic, especially the goods traffic, has not of late been so flourishing as we might have hoped, considering the increased length of open lines. Last year the gross traffic earnings amounted to 6,204,943 £.; this year they amount to 6,551,700 £. For next year they are set down at seven millions (7,006,000 £.). In my exposition of 1869 I put down the quantity of goods carried at three millions of tons annually, and the number of passenger journeys at 16 millions. At the present time the annual tonnage may be set down at 3½ millions, and the passenger journeys at 17½ millions; showing no considerable increase of late, and leaving an immense way for our traffic to make up before it will bear any favourable comparison either with the size and population of India itself, or with the results obtained from railway communication in other countries.

Nor has any great progress been made of late by the guaranteed lines towards providing for the 5 per cent. interest on capital, and towards discharging the debt due by them to the State. According to the figures of the regular estimate, the East Indian Railway is paying, upon the capital actually expended to the 31st December 1870, 4·8 per cent. per annum; the Eastern Bengal 3·1, the Great Indian Peninsula 2·7, the Bombay, Baroda, and Central India 2·4, the Madras Railway 2·2, the Great Southern of India 1·4, and the Jubbulpore extension only 1·2 per cent. The railways in India as a whole are thus, at present, paying less than 3 per cent. During the last five years the increase of earnings, whether gross or net, has been in the Bengal Presidency rather than in the Madras and Bombay Presidencies. The East Indian Railway and the Eastern Bengal line alone show any large increase. The other lines have remained comparatively stationary in this respect during this period.

So long as the construction of additional lengths of railway is going on, the capital accounts, as a whole, necessarily increase, and with them the gross guaranteed interest charge. For a reduction in the net charge on this account we must look to increased traffic receipts; but, as just explained, these have not of late kept pace with the growth of the gross charge. It is the more essential, therefore, that as the several undertakings are completed, or approach completion, and many of them are now in this state, the further expansion of the capital accounts should be strictly watched and controlled. Sreuous endeavours have been made in this direction for long past, and orders have issued quite recently for the making up of the capital accounts of the several companies. Rules have also been prescribed for a closer review of the objects for which capital outlay shall in future be incurred on open lines, and a money limit has been fixed within which all outlay on individual works shall be charged to revenue. A provision like this will, it may be hoped, result in the necessity of every work being jealously scrutinised by each party to the contract, and the constant accretion of the capital accounts by the frequent admission of small items of charge will thus be checked.

During the year by special arrangements made by the Secretary of State with three of the guaranteed railways (Great Indian Peninsula, Bombay and Baroda, and Madras), their debt to the State has been cancelled, and the right of the State to purchase the lines at the first optional period waived, on the condition that the Government shall, during the remainder of the terms of the contracts, receive half of any net traffic earnings in excess of 5 per cent. The East Indian Railway did not assent to this arrangement, and the offer will not, I believe, be repeated to them or extended to the other lines.

I must here ask leave, in reference to public works generally, to bear testimony (in which testimony your Lordship and this Council will doubtless concur) to the very valuable co-operation afforded to the financial administration by Colonel Richard Strachey, the Secretary in the Public Works Department, and now a member of this Legislative Council. Of late years the reduction of expenditure has been greater in the Public Works Department than in any other. However much this reduction is to be regretted, it certainly has been financially necessary; and I cannot testify too strongly to the able and the judicious efforts made by Colonel Strachey in this direction, without which efforts these important financial results would have been impossible.

It may be interesting to note the result of the English expenditure (ordinary) shown separately in one of the accompanying statements. In the Regular Estimate for 1870-71, it is set down at 8,302,900 £, and in the budget for 1871-72, at 8,124,800 £, showing a decrease of 178,100 £, and this notwithstanding an unavoidable increase of 80,200 £, of interest on money to be borrowed. Thus, although there have been increases during 1870-71, which I have for the most part explained to-day, there is no further increase in the budget for 1871-72.

Before leaving the subject of ordinary expenditure, for the reduction of which we have striven so hard, I shall quote a passage from a Despatch received by us from the Secretary of State in August last, which runs thus:—

"Upon a consideration, generally, of your estimates of income and expenditure, I am satisfied that you have laboured earnestly to effect every reduction which can be carried into effect without impairing the efficiency of the several departments of Government."

So much, then, for the various items of ordinary expenditure.

Besides the ordinary expenditure as above explained, there is proposed an expenditure for public works extraordinary of 3,626,000 £, or upwards of 3½ millions, to be provided for from borrowed funds, bringing up the total expenditure, ordinary and extraordinary, to 52,631,500 £, or 52½ millions. Whether the full amount of 3½ millions will be really laid out during the coming year, is more than I can say, considering that it has never yet been found possible in any year to spend the amount proposed for these works. The works in question are irrigation projects in the Punjab, North Western Provinces, Oudh, Behar, and Orissa, and the State railways in the Punjab and Rajpootana. The careful inquiry needed for these difficult irrigation projects, and the necessity of providing for adequate returns in water-rent, may account for much delay in breaking ground. The gauge question having been at length settled, we may hope to soon see a vigorous commencement with the State railway works, some of which are urgently needed to cheapen the supply of salt for the people.

The new gauge determined after much consideration by the Government of India is that of 3 ft. 3 in., or one meter, which is narrow as compared with the existing gauge in India of 5 ft. 6 in. I cannot here enter into this moot question. I shall only observe that the adoption of the comparatively narrow gauge will, in our belief, cause a large saving both in original outlay and in subsequent working charges. The importance of this consideration will be manifest from the facts I have mentioned to-day, regarding the growth of net interest charges for the existing railways. Doubtless the further extension of the railway system in the continent and peninsula of India is most desirable, but unless the work can be done more cheaply or made more profitable than heretofore, the country cannot afford to pay for such extension. That is the plain fact which renders economy in construction and management of railways so important as to weigh heavily even against considerations of efficiency.

Such, then, are the figures for 1871-72. On a comparison of income with ordinary expenditure, the result is an equilibrium, supported by a small surplus of 93,400 £, a margin which is indeed almost too low for the requirements of the public service.

I must now ask the Council to revert to the item of assessed taxes on the receipt side of

Appendix, No. 3. the budget for 1871-72. This is set down at 600,000 *l.*, which, as compared with the 2,075,000 *l.* of the current year, 1870-71, shows a reduction in this taxation of 1,475,000 *l.* This is obtained by lowering the rate of assessment from six pies in the rupee, or $3\frac{1}{2}$ per cent., to two pies in the rupee, or a fraction over one per cent., and by raising the minimum income liable to assessment from 500 rupees to 750 rupees; in other words, by exempting incomes below 750 rupees. The one per cent. income tax which we retain is manifestly indispensable, inasmuch as without it we should have to produce a budget with a deficit, which is an alternative not to be adopted so long as any legitimate or reasonable resource may remain to us.

Still it may be remembered that we now propose to reduce the income tax to the lowest rate at which it has ever been levied in India, and indeed the lowest at which it could be levied, if retained at all. The proposed rate is equivalent to $2\frac{1}{2}$ *d.* in the pound. The rate of the income tax of 1860 was 4 per cent., or $9\frac{1}{2}$ *d.* in the pound; subsequently reduced to 2 per cent., or $4\frac{1}{2}$ *d.* in the pound; the rate for the income tax of 1869-70 was, on the whole year, $1\frac{1}{2}$ per cent., or $3\frac{1}{2}$ *d.* in the pound; that for 1871 was $3\frac{1}{2}$, or $7\frac{1}{2}$ *d.* in the pound.

It is indeed a source of satisfaction to us to find ourselves able to provide for the requirements of the year with so low a rate of income tax, and to afford so considerable a measure of relief to the tax-paying classes of all degrees in British India.

More particularly are we gratified at being able to exempt all incomes below 750 rupees; the effect of this will be to altogether relieve about 240,000 persons heretofore taxed. The total number assessed to the existing income tax is about 480,000; under the now proposed tax the number will be reduced to about 240,000, which really forms a very small proportion (one in 625, or say one in 120 heads of families), out of a population of 150 millions. It was in respect to the small incomes below 750 rupees that complaints of over-assessment or exaction, or other vexation, have mainly arisen. We have been impressed by the statements made regarding the pressure of the tax, and its concomitants, upon these small incomes; troubles which, we fear, in such a country as India, are practically difficult of remedy, though of course no effort has been spared for prevention or for cure. While the rate remained low as in 1867-68 and 1868-69, these complaints were not perceptible at all or were much less rife; and no doubt this year the inherent difficulties of the case were aggravated by the increased rate. Whether they would or would not be essentially mitigated by reduction of the rate, may be a question. At all events, by the exemption of the lowest class of incomes altogether, we hope that some at least of the most salient points of objection will be effectually removed, and that the sacrifice of revenue caused by the exemption (some 150,000 *l.* at one per cent.) will not be found considerable.

It may be borne in mind that in 1860 and subsequent years, the tax reached down to incomes of 200 rupees; subsequently it was remitted on incomes below 500 rupees. The license tax of 1867 reached down to incomes of 200 rupees; the certificate tax of 1868 reached only to incomes of 500 rupees; these were both virtually rough income taxes. The 500 rupees limit was observed in the income taxes of 1869-70 and 1870-71. Thus it is clear that from time to time the policy has been to extend the exemption more and more among the poorer of the classes liable to assessment. And now we propose a further exemption beyond which it is difficult to go, if the tax be retained at all.

I have, therefore, to propose on behalf of the Government of India an income tax of two pies in the rupee, or a fraction above one per cent., and to request leave to introduce a Bill into this Council for that purpose. The Bill, if it should pass into law, will replace the existing Income Tax Act, which expires on the 31st of this month (March). We have endeavoured in the Bill to amend such of the provisions of the present law as have appeared to operate with occasional harshness, or to cause particular dissatisfaction. We do not propose to enact it for any particular period or to fix any limit of duration.

From this explanation of the revenue and charges of the year, I pass on to the provision of ways and means, and to the cash balance account.

We expected to commence the current year, 1870-71, with a cash balance of $13\frac{1}{2}$ millions (13,644,859 *l.*), and to close it with a balance of $10\frac{1}{2}$ millions (10,569,443 *l.*) On closing the account, however, finally for the previous year, we found an actual cash balance, at the commencement of the current year, of nearly 14 millions (13,940,451 *l.*), which improvement was due to the actual account of the previous year turning out more favourable than the regular estimate. We expect that the current year, after its close, will leave us a cash balance of 16 millions, or 16,012,051 *l.*, being $5\frac{1}{2}$ millions (5,442,608 *l.*) better than the first estimate (10,569,443 *l.*) Throughout the year the cash balances all over India have been very high, higher than they have been for some eight years past. (Their lowest point was $10\frac{1}{2}$ millions in October.) This circumstance is to some extent satisfactory, and calculated to raise confidence in our finance. Still there are special, perhaps adventitious, reasons why we stand so well in this respect, and even so much better than we expected at the time of my last exposition. These reasons are, firstly, that the opening balance of the year was actually higher than the estimate by 295,592 *l.*; secondly, that we have spent $1\frac{1}{4}$ million on public works extraordinary, instead of three millions, as I have already explained to-day; thirdly, that we have paid in India altogether half a million less on Secretary of State's bills than we expected; fourthly, that the amount of capital advanced to the railway companies for the construction of the lines has been less by nearly $1\frac{1}{2}$ million (1,404,200 *l.*) than was expected; fifthly, that owing to unexpected accession of opium revenue, the ordinary finance of the year has been bettered by a million, as I have also explained to-day. These reasons, with some few changes in the remittance heads, fully

account

account for the improved condition of the cash balances, and for the difference between the original and the present estimate.

As might be expected under all these circumstances, our public credit, as proved by the prices of Government stocks, has, on the whole, been higher during the current year than it has ever stood before. Our Four per Cent. stocks in India have commanded prices of 96, 97, and even 98, for every hundred rupees. In England the Secretary of State's Four per Cent. sterling paper has been sold at a small premium. In my last statement I noticed the gradual decline in the value of our Five and Five-and-a-half per Cent. stocks by reason of the limited period for which our loans at those rates of interest have currency. The decline has continued during the current year for the same reason. That our stocks bearing the higher rates of interest should decline in value, while those bearing the lower rates are rising, is manifestly a most satisfactory circumstance. It may be interesting to mention here that the amount of our rupee debt (that is, the securities of the Government of India enfaced for payment of interest in England by bills upon India) held at home, grew, during the year, from 15,839,832*l.* to 17,797,622*l.*, or by nearly two millions sterling. This is no doubt due to the adverse rates of exchange.

I have now to advert to the loan arrangements for 1871-72. There will, as might be expected, be some borrowing, inasmuch as I have already stated that 3½ millions are proposed to be spent on public works extraordinary during the coming year.

In my last statement I explained that at the commencement of the current year we had in hand 1½ million due by the Loan Department to the public works according to the account as then made up. The Secretary of State then intended to raise, by the end of 1870-71, two millions more; he has actually raised 3½. As the Council knows, we have raised nothing in India, save a quarter of a million lent by Maharaja Holkar for a state railway in his Highness' territories. These several sums make up 5½ millions. Against this we have expended in the year (as already seen) 1½ million on public works extraordinary, which, deducted from the 5½, leaves four millions in hand, for which the Loan Department has to account to the Public Works Department. To that balance, however, there is a set-off of 1,105,247*l.* advances to municipalities and the like, to which I shall immediately refer. The actual estimated balance in hand on this account, at the end of 1870-71, is about 2½ millions (2,591,438*l.*). Moreover, although our own transactions will result in the reduction of our debt by a small amount (139,800*l.*), the Secretary of State has intimated his intention of borrowing 2½ millions during the coming year, repaying only 5,000*l.*, so that we shall add to our debt, during the year, altogether 2,355,200*l.* This amount, added to the balance just shown, provides more than enough for the 3½ millions of proposed extraordinary expenditure. There is, therefore, neither need nor justification for the raising of any loan in India at present.

It is from these loan funds that we have been able to advance various sums to municipalities for reproductive works on good security for payment of the interest and repayment of the principal. The amount of advances of this nature made or brought to account since the beginning of 1869-70 is, net, 1,105,247*l.* It is, of course, practically impossible for municipalities to effect any large improvements without raising funds by borrowing. If they must borrow, it is far better that they should borrow from the Treasury rather than in the open market, for the plain reason that the Treasury can afford to lend on more favourable terms, and also because our financial control over these transactions is thereby promoted. Legal doubts, however, arose as to the competency of municipalities to contract obligations of this description. Therefore a law has been introduced into this Council to enable them to do this, and to render valid the proceedings they may take towards this end under proper sanction. These remarks are irrespective of the debentures issued by certain municipalities, such as that of Calcutta, under a special law.

If extensive disbursements shall hereafter be made under the law before this Council for facilitating advances of money by Government for permanent works of agricultural improvement, the money will be disbursed from the loan funds also.

I must here draw attention to the fast-growing interest on account of these borrowings. In 1869-70 this system was fairly begun; since then 7½ millions (7,479,099*l.*) have been borrowed, and 2½ more (2,355,700*l.*) are now to be borrowed; in all, 10 millions (9,974,099*l.*); of which 3½ millions (3,782,411*l.*) have been spent on public works extraordinary, and 3½ (3,626,000*l.*) are now set down to be expended; in all, 7½ (7,408,411*l.*) millions: besides which, a million (1,105,247*l.*) has been advanced, as I have above shown. The annual interest on the total sum thus borrowed amounts to more than 450,000*l.* annually; on the total sum expended, or to be immediately expended, it amounts to 350,000*l.* It is hoped that the yearly increase of the item now separately shown as irrigation income will prove more and more a set-off; and that when the State railways shall be opened there will be a further set-off in that direction. The more complete exhibition of all the income derived by the State from its canal works has occupied and is still occupying the attention of the Government of India, and some important points of legislation connected therewith have been brought under the consideration of this Council.

The entire registered debt of India (exclusive of 6,299,700*l.*, East India Stock, for the redemption of which a guarantee fund is accumulating under the provisions of c. 85, 3 & 4 Will. 4) is expected to amount at the end of 1871-72 to 106½ millions (106,853,400*l.*), of which 67,089,600*l.* will have been borrowed in India and 39,765,700*l.* in England. The interest estimated to be paid in 1871-72, exclusive of the dividends on the East India Stock, is 4,742,000*l.*, being 4·44, or less than 4½ per cent. upon the whole registered debt.

We duly bear in mind the amounts of the loans bearing interest at five per cent., repay-

Appendix, No. 8. able during the coming year; but I cannot yet state the intentions of the Government of India in regard thereto.

After the loan provisions which I have just explained, it remains to see how the cash balances will stand for the coming year, 1871-72. In my last exposition before this Council I described the improvements made in the form of the estimate of the cash balances. It will be remembered that this great account comprises a variety of important items besides the regular income and expenditure of the Government; inasmuch as the Indian Exchequer performs a vast amount of business in addition to the receiving of the Government revenues and the disbursing of the Government expenses. The general nature of this business I have described in previous expositions.

I will first set forth the result of the figures on both sides of the account in India, exclusive of England.

The receipt side then is as follows:—

Commencing the year with an estimated cash balance, as already seen, of 16 millions, and a Government income of 49 millions, we expect, besides, $6\frac{1}{2}$ millions of railway traffic receipts, $17\frac{1}{2}$ millions of advances recovered and deposits repayable, including local funds; and $1\frac{1}{2}$ million on the remittance or suspense account between England and India; making, with some other smaller items and transfer entries, in all $91\frac{1}{2}$ millions ($91,871,051$ L.). On the payment side, besides the ordinary expenditure of 39 millions and the extraordinary of $3\frac{1}{2}$ millions, we have $8\frac{1}{2}$ millions railway working expenses, $18\frac{1}{2}$ millions of advances recoverable and deposits repaid, nine millions to be paid on bills of exchange drawn in England by the Secretary of State; and $1\frac{1}{2}$ million to be disbursed for construction of railways in India by the guaranteed companies; making, with some transfer and account entries, a total of $70,749,800$ L., or $76\frac{1}{2}$ millions. This total, deducted from the $91\frac{1}{2}$ millions shown on the receipt side, leaves us an estimated cash balance of 15 millions ($15,121,251$ L.) on the 31st March 1872, being the close of the coming year, 1871-72.

There is also the cash account kept by the Secretary of State in London on account of India. For the coming year, 1871-72, the receipt side is in this wise: the opening cash balances will be two millions; the amount received on bills of exchange drawn on India will be nine millions; there will be $4\frac{1}{2}$ millions of railway capital subscribed, and there will be $2\frac{1}{2}$ millions borrowed. These, with some smaller items, make up a total of $18\frac{1}{2}$ millions. On the payment side there will be a regular expenditure, ordinary and extraordinary, in England on account of India, of 13 millions ($13,114,300$ L.); there will be $1\frac{1}{2}$ million paid on the remittance account, and there will be two millions withdrawals of railway capital. These items, deducted from the $18\frac{1}{2}$ millions on the receipt side, leave a closing balance of $2\frac{1}{2}$ millions.

The aggregate of estimated receipts and payments in India and England for the year, as I have shown above, stands at $110\frac{1}{2}$ millions ($110,295,334$ L.) on each side of the account. I have not attempted to do more than give a sketch of this really vast account, the complete development of which would weary the Council. But even this outline will convey some idea of the dimensions to which the transactions of the Indian Exchequer have grown.

I have said that in the deposit receipts are included the local funds, the expenditure from those funds being shown in deposit payments. A new and interesting character will now attach to these funds. They have heretofore, as the Council knows, included the road fund, ferry fund, pound fund, educational cesses, police cesses, profits of prison labour, hospital funds, port and harbour funds, municipal octroi fees under special Acts, and so on. To these there are now added the $656,400$ L. already described to-day, being the receipts of the departments of gaol, registration, education, and police, transferred from the Imperial sheet. The total thus made up for 1871-72 amounts to $4,028,473$ L., or four millions for all India. There will also be added the proceeds of the new local taxes that may be imposed by the local Governments; so the heading will shortly show an augmentation, and may probably grow year by year. Each local Government will in future exhibit a sheet of its income and its expenditure under this head; and in this statement there will be combined the income and expenditure under the new allotments for provincial services described to-day, amounting to $4\frac{1}{2}$ millions; so that the local budgets under the new measure will deal with an aggregate income of nearly nine millions to start with.

Before finally quitting the finances of the year, I must ask leave to notice certain remarks which have been made, and indeed reiterated, regarding the accounts of the Home Treasury of the Government of India which are kept in England. It has been said that the expenditure in England on account of India is incurred without sufficient reference to the authorities in India, and that the detailed accounts of it are not made known in India. Now, I showed in my last exposition that by far the greatest part of that expenditure is really incurred either under rules proposed by the Government of India, or upon requisitions made by the Government of India. So far we ourselves must accept a very large share of the responsibility. There are some exceptions to this, but they are not considerable. So much for the expenditure. No doubt the accounts of that expenditure are kept under the direct orders of the Secretary of State for India; but they are rendered to us month by month, with the greatest regularity and the fullest detail. We again publish the account annually, with all its details, in the "Gazette of India," and have usually done so for years past; the publication taking place in the summer. In short, the information before the public in India regarding the expenditure in England is as full as that regarding any portion of the public expenditure whatever.

I may

I may add one word about the Indian accounts. The entire approximate actual accounts for the year 1869-70, ending 31st March 1870, were published on the 3rd September 1870; that is, in five months after the completion of the year. The regular estimate for the year 1870-71 is produced to-day early in the 11th month of the year, comprising more than 10 months' actual figures for all the revenues and for all the civil expenditure, and nine months for the remainder. Now, considering that we have to deal with accounts from eight local Governments, from 12 Imperial departments, and 225 treasuries—all scattered at great distances—I think that these facts show a high degree of promptitude and discipline in the Account Department throughout British India.

After this exposition of the prospects of 1871-72, it remains to notice very briefly several measures which have been adopted in connection with finance.

In my statements made in March 1869 and April 1870, when noticing the success of the three Presidency savings banks, I stated that measures were being devised for the ramification of these institutions throughout the interior of the country. During the current year these measures, after long discussion, were introduced in the several divisions of the Bengal Presidency. The number of new banks already opened is 49; the total deposits, on the latest dates for which we have returns, amount to 1,20,693 rupees, or 12,069 £; and the number of depositors is 925. The deposits will doubtless increase from time to time, the present result being only a commencement. This is, of course, in addition to the Presidency Savings Bank at Calcutta, which now has 291,640 £ of deposits and 7,464 depositors. We have not yet opened district savings banks under that name in the Madras and Bombay Presidencies, but practically they do exist in every district under those Governments, as the Government Savings Banks in both Presidencies extend their benefits to all depositors without the restriction which was placed upon such institutions in Bengal, where Government servants only were permitted to open deposit accounts. The Government Savings Banks in the Presidencies of Madras and Bombay are very freely resorted to. The present number of depositors in the Madras banks is 7,189, and in those of Bombay 15,679; the aggregate amount deposited in the Madras banks is 187,727 £, and in the Bombay banks 441,137 £. But the figures in both Presidencies are believed to include the deposits of the native army. The system in these Presidencies may perhaps eventually be assimilated to that now introduced in the rest of India. The total of deposits in the savings banks of all kinds in the three Presidencies now stands at 932,573 £, and the number of depositors amounts to 31,257. This is exclusive of regimental savings banks in Bengal, the deposits in which amount to 76,000 £. These figures show an increase of nearly 40 per cent. since I first drew the attention of this Council to the subject two years ago. That the increase may be progressive year by year is much to be wished.

In my last statement I adverted to the measure then before this Council for increasing the proportion of the paper currency reserve to be invested in Government securities, and for raising the limit from four millions to six; adding that the operation, if authorised by law, would, in practice, be kept cautiously tentative. The Bill has since passed into law, but we have not yet, under the circumstances of the currency, seen fit to avail ourselves of the power which has been taken. We rather prefer for the present to keep our specie reserve large and full, in order that we may have the means of facilitating the encashment of the notes, of whatever circle, at all the principal treasuries throughout the country. Arrangements of this kind appear even more than ever desirable, since we have (within the current year) obtained power by law from this Council to issue notes of five rupees; a lower denomination than has ever yet been tried in India. I have so recently explained in detail to this Council the arguments in favour of the five rupee note, the conditions under which the offices of the interior circles of India are to cash notes of all other circles, the arrangements for cashing notes at the ordinary treasuries in the districts in the interior, and the general state of our paper circulation and our reserves, that I need not advert further to the subject now, beyond stating that the average weekly circulation of 1869-70 has proved to have exceeded 10½ millions (10,630,473 £), a slight increase over any previous year; that the circulation of the current year does not promise to be equally favourable, the estimated average circulation appearing not likely to exceed 10 millions; and that the reserve consists of 6½ millions (6,846,106 £) in specie, and 3½ millions (3,227,200 £) in Government securities; the specie reserve being manifestly strong.

The money-order system in India is successfully making good its ground. During the past year 1869-70, orders were issued to the amount of 116 lakhs of rupees, or a little above a million sterling. It is matter of regret that we have not yet been able to establish a similar system between India and England, but difficulties arising out of the fluctuations of exchange have hitherto prevented this. We still hope that these difficulties may be overcome.

I am still unable to report any marked result from the Notification of November 1868, whereby it was announced that the sovereign would be taken at the Government treasuries as an equivalent for Rs. 10. 4., instead of 10 rupees as before. The value of a sovereign having exceeded Rs. 10. 4. throughout the year, no sovereigns have been received at the general treasury, and scarcely any by the Currency Department. The importation of gold into India during the year 1870-71, is expected to amount to only between two and three millions against 5,690,400 £ of the preceding year. Gold has been tendered by the public at our mints for coinage into Indian gold pieces to the value of only 4,775 £. These operations have been of course much affected by the state of the exchanges so greatly militating against the presentation of bullion for coinage. During the year we have, after much unavoidable delay, obtained from England the requisite mechanical appliances for coining gold pieces

Appendix, No. 8.

of ten and five rupees (in addition to the 16-rupee pieces previously coined) under the existing law. A few of these smaller pieces have been coined by the Government, and may be considered to represent the Indian sovereign and half-sovereign. I hope that this measure may help to pave the way for the future introduction of a gold currency into India.

Such, then, is the exposition which I have this day to offer. The main points have been—

That for 1869-70, instead of an anticipated deficit of 625,594 L., there has been an actual surplus of 118,668 L.;

That for 1870-71 the surplus estimated in the budget at 163,440 L. is now estimated at 997,100 L., or one million;

That this surplus is really due to an unlooked for accession of opium revenue;

That without this accession of opium revenue, there would have been little more than an equilibrium between income and ordinary expenditure;

That for 1871-72 there is estimated a small surplus of income over ordinary expenditure of 93,400 L.

That this estimate is arrived at after a large abatement of the income tax: the lowest incomes assessable, namely, those between 750 and 500 rupees, being exempted altogether, and the rates for all classes being lowered from $3\frac{1}{2}$ to a fraction above 1 per cent.;

That this change in the income tax causes a reduction of $1\frac{1}{2}$ millions of direct taxation;

That the exemption of incomes between 750 and 500 rupees reduces the total number of persons assessed, 480,000, by fully one-half, and releases 240,000 taxpayers;

That the ordinary expenditure for the coming year shows a decrease of one million of expenditure as compared with the current year;

That, subject to certain conditions, an increased financial control has been entrusted to the several local Governments in respect of gaols, registration, police, education, medical services, printing, roads other than military, and civil buildings;

That the grants by the general treasury for these services have been reduced by 331,038 L., and that a fixed limit is imposed on the imperial expenditure on these departments;

That for these provincial services throughout India, allotments have been made of $4\frac{1}{2}$ millions distributed among the various local Governments;

That apart from the allotments made to the local Governments under these provincial services for roads and buildings, the ordinary public works grant in India has been brought down to $2\frac{1}{2}$ millions;

That $3\frac{1}{2}$ millions have been raised by loan in England since my last statement was made, while only a little above one million has been expended on public works extraordinary;

That $3\frac{1}{2}$ millions are proposed to be spent on public works extraordinary during the coming year 1871-72, $2\frac{1}{2}$ millions being provided for by loan;

That owing to the improvements in the account of the income and ordinary expenditure of Government, and the temporary diminution of expenditure on public works extraordinary and on construction of the guaranteed railways, the cash balances in India are very high, and that no loan is proposed in this country;

That during the current year various measures relating to finance have been carried out, such as the coinage of ten-rupee and five-rupee gold pieces, the legalisation of a five-rupee note in the paper currency, the introduction of district savings banks in the interior of the country.

I must now conclude my exposition. If it be found (as I fear it will) meagre and imperfect in many respects, still I hope the Council will remember that my subject is really too varied and extensive to be fully treated in all its particulars within the limits of the patience of my hearers. At all events, within these necessary limits, I have striven to compress as many facts and considerations as possible.

In 1869 I spoke of flourishing revenue and growing commerce. In 1870 the burden of my story was diminished income and depressed trade. In 1871, however, I have now once more to tell of national prosperity, of abundant harvests, of rising income, of falling expenditure, of improved public credit. In two successive expositions (1869 and 1870) I have had to lament the existence of deficit. But on this occasion, in my third exposition, the picture is at last relieved by the prospect of surplus. The Council knows what strenuous exertions have been made to obtain equilibrium and even surplus. Those efforts seem at this moment likely to be attended with even more success than we at first ventured to hope for.

In 1869 I affirmed that the Government of India had aimed at a financial policy to be at once safe, sound, and just. Since then, two years of trial and labour have passed; and I affirm once more that the same principles have been strictly observed, notwithstanding that the observance caused much trouble and difficulty.

We have maintained a strict distinction as to what expenditure shall, and what shall not, be considered extraordinary to be provided for by loan. All expenditure, however beneficial, not yielding a direct pecuniary return, has been classed as ordinary expenditure. We have resolved that, so far as may be possible, the whole of the ordinary expenditure of each year shall be defrayed from the revenues of that year. We have jealously guarded against

against everything that might tend to shift the burden of these just charges from the present to the future. We have steadily refrained from providing by loan for any branch of ordinary expenditure or for any public work not yielding a direct pecuniary return. We have even refused to entertain proposals for temporary or terminable loans for such purposes. In preference to any such course, the alternative of enhancing the existing taxation has been adopted. But that taxation has been so adjusted as to fall rather on the richer than the poorer classes of this country. Though the revenue has been augmented, yet no fresh burden whatever has been imposed on any branch of trade or of industry; no new imperial tax has been introduced; no fiscal innovation has been applied to British India generally. In so far as any fresh tax may be needed in any part of India, the disposition has been to rely on local rather than imperial arrangements. Appendix, No. 3.

Retrenchments in both the civil and the military branches of expenditure in India have been made. To afford further relief, the expenditure on ordinary public works has been cut down by more than one-third. Strict economy in details has been enforced by the Government of India and by the local Governments. The better enforcement of economy was one of the reasons for investing the local Governments with increased financial control in several departments. That measure also has been commenced by a further reduction of one-third of a million of expenditure.

On the other hand, liberality has been shown in the provision by loan for public works of an extraordinary and reproductive character. But this operation has been so far guarded financially, in that the interest on the borrowed capital is charged against ordinary revenues.

Though carefully weighing all that can be urged against any part of this policy, we have not been, and are not, persuaded, by any consideration whatever, to depart or deviate from it as a whole. We are still prepared to persevere, and to make any effort that can fairly and reasonably be made to act up to these principles; though we are glad to be enabled by improved circumstances to propose for the coming year a relaxation of some of the stringent measures which, to our regret, had become indispensably necessary for the current year.

At the request of his Excellency the President, the Honourable Mr. Stephen stated that the Bill would be introduced in Council on the 17th instant, and would on that day be referred to a Select Committee. The Committee would probably present their report on the 24th, and the Council would then be in a position to take the report into consideration, and would be able to pass the Bill on the 31st. He might further state that the Bill would be published in the "Gazette of India" on Saturday next.

The motion was put, and agreed to.

The Council adjourned to Friday, the 10th March 1871.

Calcutta, 9 March 1871.

Whitley Stokes,
Secretary to the Government of India,
Legislative Department.

Appendix, No. 4. .

PAPER furnished by Sir H. Bartle Edward Frere, and referred to in his Evidence,
28 March 1871 (Question 448).

Appendix, No. 4.

MEMORANDUM ON PRICES IN WESTERN INDIA.

(Information called for in Question 448.)

In July 1863 the Government of Bombay appointed the two Revenue Commissioners, Messrs. Hart and Ellis, and Lieutenant Colonel Dunsterville, the Commissary General of the Bombay Army, a Commission to inquire into the changes which had taken place during the preceding 40 years in the money prices of the principal articles of consumption, in the wages of skilled and unskilled labour, and in house rents at the principal military stations in Western India. Commission to inquire into prices, appointed 1863.

The Commission was to inquire into the apparent causes of any changes of price, whether temporary or permanent, and the general effects of the change, and how far Government had any power to remedy such effects as might seem likely to cause permanent injury to any class or interest.

The Commission reported in March 1864. They sent in elaborate tables of the prices during 40 years of the principal articles of consumption and clothing, wages, house rent, &c., in each of the various provinces of the Bombay Presidency. Report.

They reported that prices had been rising without intermission for several years; that the rise was not confined to any one class of articles; e.g., comparing prices in 1829 and 1863, and in the three principal provinces of Western India, they found that,— Progressive rise in prices for many years.

	In Guzerat.	In the Deccan.	In the Southern Mahratta Country.
Ghee (clarified butter) cost more in 1863 than in 1829, by - - - - - per cent.	93	147	165
Milk ditto - - - - - „	115	30	200
Sweet oil ditto - - - - - „	76	110	122
Coarse cloth, such as is used by the poorer classes, ditto - - - - - „	167	167	400

The Commission stated that Colonel Baird Smith had, in his report on the famine in the North Western Provinces, given as the highest prices of wheat in those provinces in the famine year of 1837-38, 11½ to 12½ seers the rupee, and in the famine year of 1860-61 7½ to 8½ seers. But the Commission ascertained that in 1863 the prices of wheat in Guzerat had ranged from only 6½ to 8½ seers per rupee, according to quality, while in the Southern Mahratta country the price had ranged from 6½ to 7½ seers. In some cases, e. g. wheat, to famine pitch.

With regard to the causes of the increase in prices, the Commission reported them to be:— Causes of rise in prices.

1. Large importations of silver, and consequent fall in the comparative value of money.
2. Greater demand for all articles of consumption, owing to increased means.
3. Less production of cereals, the price of which especially affects the wages of labour.
4. The greater distance whence supplies of grain have to be drawn.
5. Competition for labour, owing to railways and other great public and private works.
6. Rise of prices on the plea of increased taxation.
7. Prohibition of export of grain from some foreign states.
8. Hoarding of grain by producers who had become independent of the market.

But of all these causes the Commission considered the first (i.e., the influx of silver) the principal one, and the most general in its effects, and that in fact all the other causes emanated from it.

Appendix, No. 4.	With regard to the permanent or temporary character of such causes, the Commission did not anticipate any material fall as likely to occur unless any extensive export of silver should occur, which they did not anticipate; they deemed it more probable that prices would continue to rise.
Rise in prices likely to be permanent.	
Effects of rise in prices.	As to the effects of the rise in prices, the Commission reported that it had given an impetus to all commerce and industry, and had increased the prosperity of all classes, except,—
Generally beneficial, except as regards three classes.	<ol style="list-style-type: none"> 1. Persons with fixed incomes. 2. Persons without produce or labour to dispose of. 3. Petty manufacturers deprived by dearness of material of means of working.
Inability of Government to afford relief.	The Commission were of opinion that Government could afford no relief to any of these classes, except in the case of Government servants. They recommend a revision of official salaries, especially in the lower grades, where, but for some partial and temporary additions in the case of salaries under 20 £. per annum, it would, they stated, have been impossible to carry on the public service. They represented as specially calling for relief the case of warrant and petty officers, and of the subaltern officers of the army.
Except in the case of the poorer Government servants.	
Special facts noted by the Commission.	The following are among the noteworthy facts established by the labours of the Commission:—
Nature of the returns sent in by the Commission.	The Commission forwarded returns compiled from the very voluminous statements sent in by the local officers, showing the maximum and minimum prices of articles of consumption, wages, clothing, house rents, &c., in each province of Western India, for 40 years. The prices taken were generally the average of the official returns for 12 months for each year, in each province. Sometimes these averages were given for single typical years, as 1824, 1829, 1863. But for the 30 years, 1830 to 1860, the prices were further grouped in averages of 10 years, 1830–9, 1840–9, 1850–9. It is impossible to summarise returns of this kind. They form, by far, the most complete and carefully arranged record of prices which exists in India.
Relating to prices for 40 years, from 1820 to 1864.	
Extracts from the returns.	<p>The following extracts will give a general idea of the results deducible from them as regards the articles of more common use, by both natives and Europeans.</p> <p>The figures in the following Table show the weight of each article procurable in tolas (each of 180 grains troy), for one rupee (2 s.).</p> <p>The provinces specified are:—</p>

Guzerat, including the Collectorates of	- - -	{ Ahmedabad, Kaira Surat.
Deccan, ditto - - ditto		{ Khandeish, Ahmednuggur. Poona. Shoalpoor, and Sattara.
S. Maharatta Country, ditto - ditto - -	- - -	{ Belgaum, and Dharwar.
Concan, ditto - - ditto - - -	- - -	{ Rutnagherry, and Tanna.
Island of Bombay.		
Sind, ditto - - ditto - - -	- - -	{ Kurrachee, Hyderabad, Shikarpoor.

The returns for Sind go no further back than 1843.

FOOD.

Coarse sugar - - - - - (Goor, the sugar before the molasses are separated, seems to have been generally about half the price of coarse sugar.)	160	S. Maharatta Country.	"	659	Sind - -	1843-9
Salt, price locally affected by taxation - - -	507	"	"	22,400	" - -	1843-9
Mutton, used by natives and Europeans - - -	160	"	"	861	Bombay - -	1840-9
Beef, used only by Europeans, Madomedans, and a few of the lower classes of Hindoos - - -	{ (?)53 274 }	{ Concan - - Guzerat - - }	{ " - - " - - }	{ 1,260 }	S. Maharatta Country.	1829
Tobacco, price locally affected by taxation - - -	138	Bombay - -	1860-3	839	Sind - -	1850-9
Of the following articles, the quantity in the 2nd column shows the weight in pounds (avordupois) procurable for a rupee (2 s.) :-						
	Lbs.			Lbs.		
Whonten bread, first sorts, per rupee - - -	5	S. Maharatta Country.	1863	17	S. Maharatta Country.	1829
Cotton - - - - -	1	Deccan - -	"	20	Sind - -	1830-9
Hay - - - - -	{ (?)8 56 }	{ Concan - - S. Maharatta Country. }	{ 1850-9 1863 }	{ 489 }	"	1843-9
Of the following articles, the 2nd column shows the number of each article procurable for a rupee (2 s.) :-						
	No.			No.		
Fowls - - - - -	1	Guzerat - -	"	15	S. Maharatta Country.	1829
Yards of coarse dungaree (native cotton cloth) -	2	S. Maharatta Country.	"	16	Sind - -	1843-9

It appears from the Tables whence these examples are taken that prices had been generally falling from 1824 to 1829, and were about that time at their lowest in most parts of Western India. General results deduced from the returns.

That they were almost everywhere higher in 1863 than at any period during the series of years referred to.

That the greatest variations took place where the means of intercommunication were most defective.

That the greatest changes (except in the case of articles like milk, difficult of transport for long distances) and the highest prices were rarely in Bombay itself, which draws its supplies by railway and sea from an exceptionally large area.

These results are still more clearly seen by comparing the average prices of a single article of general consumption throughout the series of years, and in several provinces. For example, wheat, the figures in the following Table show the highest and lowest average number of tolas (of 180 grains troy), procurable for a rupee (2 s.) in each year, and place specified. The returns for each place generally show a range of price, at the same time and place, according to quality, varying from 5 to 10 per cent.

Appendix, No. 4.

Manufactured
articles.

In some respects a better criterion of prices is to be found by comparing the prices of manufactured articles of very common use, or the rates of wages of artisans and labourers. Thus it appears from the Commissioner's Tables that the price of a coarse black woollen blanket (camblic), commonly used by the lower classes, as a cloak and sleeping-rug, varied in Bombay from 10½ d. in 1850-9, to 1 s. 6 d. in 1863, while in the Southern Maharatta country the price of the same kind of blanket varied from 15 d. in 1829 to 10 s. in 1863. A common cotton dress for a native woman (saree) varied from 15 d. in Guzerat in 1829, to from 4 s. 6 d. to 8 s. in 1863, and to 16 s. in Sind; while in the same year in Bombay, the highest price was 2 s. 3 d.

The price of common native shoes varied in Guzerat from 15 d. in 1829 to 2 s. 4½ d., after which they declined to less than 2 s. In the Southern Maharatta Country they were in 1824-9 procurable for 7½ d., after which they rose to 1 s. 6 d. and 2 s. In the Deccan and Sind they were somewhat dearer in 1863.

Wages.

The following Table shows the variations in the average monthly wages of a carpenter:—

	Average of 1824 to 1829.		1829.		Average for 1830-39.		Average for 1840-49.		Average for 1850-59.		Average for 1860-63.		For 1863.	
	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.
Guzerat -	21 3	10 3	21 3	10 3	23 3	22 10	23 1½	18 3	21 -	20 -	30 -	29 6	30 7½	30 -
S. Maharatta Country.	22 6	15 -	22 6	15 -	22 6	15 -	22 10	15 -	26 -	20 -	45 -	37 -	60 -	40 -
Bombay -	-	-	No return	-	30 4	-	28 10	25 6	32 7½	29 9	49 8½	46 6	58 -	54 3½

Masons seem generally to have been paid about the same rates, and their wages rose in nearly the same ratio. The same was the case with the wages of tailors and washermen, who were usually paid at about the same rates, approximating to three-fifths of the wages of a carpenter or mason.

The following Table shows the variations in the average monthly wages of a coolie or common day labourer:—

	1824-29.		1829.		1830-39.		1840-49.		1850-59.		1860-63.		1863.	
	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.
Guzerat -	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.
S. Maharatta Country.	7 6	3 9	7 6	3 9	7 6	3 9	7 6	4 4½	8 9	5 7½	15 10½	11 3	30 -	22 6
Bombay -	-	-	No return	-	14 9½	11 3½	12 3½	11 10½	14 2	-	19 4½	15 6	27 -	15 6

The rates of wages in the Deccan were generally 8 to 10 per cent. lower than in Guzerat.

The prices in large towns, and especially in military stations, differed considerably from the prices prevailing in rural districts; the following Table is taken from returns intended to illustrate the fluctuations of prices which specially affected the lower paid classes of Europeans:—

Prices in large
towns.

* N.B.—Returns for Bombay itself not being procurable for a long period, the returns of the neighbouring station of Tanna are given.

With

With regard to the imports of precious metals, the Commission found that the books of the Bombay Custom House showed that between 1848-49 and 1862-63 the silver bullion and silver coin imported into Bombay by sea, exceeded the exports by 11,529,711 *l*.

The total quantity of uncoined silver bullion so imported during the period was nearly 44 millions sterling, the exports being about 27½ millions. This was exclusive of a considerable importation of coined silver. The annual rate of importation had gone on rapidly increasing, while the proportion re-exported had progressively diminished. Dividing the 15 years from 1848 to 1863 into three periods, the Commission found the following results as regards silver coined and uncoined.

Appendix, No. 4.

Influx of precious metals.

	Annual Average of Imports.	Annual Average of Exports.	Per-centage of Exports as compared with Imports.	Net Increase in Bullion and Silver Coin which remained in the Country.
	£.	£.	£.	£.
During the first seven years, from 1848-9 to 1854-5 -	650,926	1,095,115	60	555,180
During six years to 1860-1 - - - - -	5,756,288	1,387,490	24	4,368,798
During two years, 1861-2 and 1862-3 - - -	8,303,178	1,697,744	20	6,605,433
			- - - £.	11,529,711

These results did not include imports or exports of silver other than those declared at the custom house, and as there is no duty on bullion or coin, none but large sums were, as a rule, declared.

Nor did the return show imports or exports by land, nor gold, of which of late years the import has been considerable, and yearly increasing.

The Bombay Mint Returns examined by the Commission extended over 31 years, and confirmed the results deduced from the custom house returns. They showed that the annual average of silver coined into rupees had been of the value:—

	£.
From 1832-3 to 1846-7, of - - - - -	1,026,300
„ 1848 to 1855, of - - - - -	1,368,809
„ 1855 to 1861, of - - - - -	3,235,600
„ 1861 to 1863, of - - - - -	6,276,900

As regards the effects of the rise of prices on the people, one collector (Mr. Probert, Ahmedabad) states, “the labourers are rich, and for every 500 consumers of superior kinds of grain* in bygone years there are now 10,000.

Another (Mr. Golsfinch, Belgaum) points out that the prosperity of the cultivating classes in the South Mahratta country commenced with the introduction of the revised rates of assessment about 30 years ago.

It was furthered by the rise in prices consequent on the Russian War in 1854-55, by the mutinies in 1857-58, “which caused an enormous expenditure in the country, and it has been brought to an incredible pitch by the American War.”

“The cultivators now, in fact, occupy the position formerly held by the grain dealers. They command the grain supply of the country, and sell or withhold as it pleases them.”

Mr. Shaw Stewart states that in Canara, a coast district, prices had been rising since 1841. “Now (in 1863) for the first time within memory, rice is being imported into Canara,” from ports lower down on the Malabar coast, to supply the market in the South Mahratta country, which always before used to export grain.

Mr. Ingle, at Kurrachee in Scind, notices the abolition of statute labour as having raised the wages of labour in Scind.

In the South Concan Mr. J. Robertson notices the greatly increased value of land, which had become saleable for high prices where it was hardly ever saleable before.

In Sholapoor (Deccan) Mr. Duff says, “the poorer classes are now far better off than they were 10 years ago. It is an uncommon sight to witness the rags and misery which were common enough formerly; everyone willing and able to work can easily earn enough to support himself and family in comparative comfort.”

This is the general testimony on all sides and from all provinces.

Everywhere in the vicinity of railway works the collectors remark on their great and immediate effect in raising prices, especially the wages of labour. Many thousands who were formerly producers of grain have, since the railway works began, become consumers. The demand for labour on the railways reached even districts very remote from the railways.

There

* Pulse (Dall ore) is one of these superior kinds of grain, and contains much more nutriment in proportion to its bulk than cereals. The consumption of meat by natives has everywhere in Western India greatly increased.—H. B. E. F.

Appendix, No. 4. There was a great difference not only in the numbers of labourers employed, but in the mode of paying them. Formerly agricultural labourers were very generally paid in kind, and rarely received money wages. They were almost universally in debt to the village money lender and grain dealer. The practice on railway works of promptly paying for all labour in liberal money wages, caused an important social revolution in the habits of all who live by labour, even at a great distance from the actual railway works. The labourers often travelled from their homes 200 miles, or even more, to obtain work so paid, returning to their fields at the cultivating season and harvest time.

The collectors were also unanimous in indicating the extension of cotton cultivation consequent on the American War and of oil seed cultivation consequent on the Russian War, as having greatly contributed to the general rise of prices.

Mr. Probert (Ahmedabad) notes the extension of cotton cultivation from 46,121 acres in 1859-60, to 72,953 acres in 1862-63. "Owing to the exportation of cotton, the tendency has been not only to raise the price of grain, but to double the price of clothes of all kinds. Thus a portion of the poorer classes suffer both in food and clothing, though many of those originally poor are now in a comparatively flourishing condition."

Mr. Ashburner (Kandeish) notes that railways and public works created a demand for labour (paid for in money wages), and withdrew much labour from agriculture. This threw much money into the hands of the lower orders, who had not yet acquired a taste for "the luxuries or secondary wants of life." They spent all their money in food. Prices of food and necessaries of life rose. The American and Russian wars raised the prices of cotton and linseed, and the cultivation of grain for food being thus contracted, prices rose; the annual rains failed; in anticipation of famine, grain merchants kept back stocks, the Nizam prohibited export of grain from his adjoining territory, while railways continued to export towards the coast."

[In other words, increased money wages gave the labourers increased means of purchasing food, and they did purchase it to a greater extent than before; but the increased demand was not met by increased supply, partly from want of irrigation and adequate means of internal communication, partly from the unwise fiscal restrictions on export imposed on neighbouring grain producers.]

There is general testimony to the revision of rates by the revenue survey and assessment having greatly contributed to the well being of all classes, but it had to some extent counteracted the tendency of prices to rise, where the reduction of assessments had led to the cultivation of land formerly waste.

All the collectors regarded the rise in prices as likely to be progressive for some time to come, and most of them as permanent.

Salaries of merchants and bankers' clerks. References were made to 17 of the principal banks and the oldest of the leading mercantile firms in Bombay, to ascertain whether they had given any and what general increase of salary to their establishments on account of the increased cost of living. Two of the replies stated that no increase had yet been given, but one of them added that the subject was under consideration.

Two had raised all salaries 15 per cent. since 1863.
Four " " 25 per cent.
And one added that the necessity of a further increase was then under consideration.
Four had raised all salaries from 25 to 35 per cent.
One " " 40 per cent.
One " " from 20 to 50 per cent.
One " " 50 per cent.
One had doubled salaries since 1859.

These were increases of salary all round to all employed, and in addition to increase given in individual cases to reward or retain special servants; also, in addition to bonuses, given in some cases periodically.

Adverse effect of the rise of prices on persons with fixed incomes. All the officers consulted were unanimous in their testimony to the suffering caused by the rise in prices to all persons with fixed incomes, and especially to the lower classes of Government servants.

Returns were obtained of the actual cost of living of three families of Brahmans, the class from which the educated native servants of Government are chiefly drawn in the Deccan (Poona) in 1829 as compared with 1863. They gave the following results as the average monthly expenditure of each class:—

	FIRST CLASS.			SECOND CLASS.			THIRD CLASS.		
	Food.	Clothing.	TOTAL.	Food.	Clothing.	TOTAL.	Food.	Clothing.	TOTAL.
	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.

There

There was every reason to believe that the case of the lower salaried servants of Government in many parts of the Presidency, especially in the Southern Maharatta country, was even worse. Almost every collector reported great difficulty in filling up vacancies in the Government service; and the impossibility of enforcing an efficient and honest performance of duty by ill-paid officials, who set little value on their situations and had ceased to dread dismissal. Many in the higher grades resigned what had formerly been considered excellent prospects of promotion and pension, owing to the difficulty of living on their official salaries. This tendency was observable even among European officers, and the evil effects were very seriously felt in the police force in several provinces. The sufferings of pensioners and others who were unable to turn to other modes of subsistence were represented as very serious.

The increase in house-rent had been very marked throughout Western India, but the rate of increase differed greatly at different stations, owing to a variety of causes which did not affect prices generally. Only one return notes "no perceptible change." In 23 other returns (exclusive of Bombay itself) the increase varies, being stated in two cases at "double," and "increased 150 per cent." in 20 years. The greatest increase noted was in the Island of Bombay, where the municipal authorities, judging from their assessment books, reported that during the preceding 15 years the rents of first class dwelling-houses and mercantile offices had trebled, while the rents of the houses of the middle and lower classes had doubled.

House rents.

The following return, taken from the report of the Municipal Commissioner in Bombay, for 1868, shows how greatly the rateable value of house property in Bombay, which is an index of the rental, has increased during 10 years.

RATEABLE VALUE of Properties assessed for House Tax (a Municipal Impost).

" Horse-keepers - - - - 5	- - - - - 8 $\frac{9}{16}$

In Bengal, the returns were from Patna, Dacca, and Kishnaghur. In Bombay, from all parts of the Presidency.

While the inquiry into prices was in progress, on the 28th November 1863, Mr. Hart, the Revenue Commissioner of the Southern Division, reported as the result of his inquiries from the local officers, that the "state of our troops in Belgaum, as regards the main article of their food, resembles that of troops besieged in a hostile country, and that the lower salaried servants of Government, military and police, on whom the peace of the country depends, were under great temptation to break it, to obtain food for themselves and their families."

On the whole community the pressure was stated to be similar to that produced by a total failure of crops. But as much grain was believed to be hoarded, the Revenue Commissioner had very grave apprehensions of some outbreak ere long, the consequences of which would be most lamentable.

This led to a very animated discussion between the Government of India and that of Bombay, relative to the necessity of permanently raising the salaries of public servants, especially in the lower grades.

Discussion as to the
necessity for raising
salaries of the lower
grades of officials.

Appendix, No. 4.

A general reduction of salaries had been made by the Bombay Government in 1829, grounded on the fall in prices to the extent of from 20 to 25 per cent., which had taken place during the few previous years.

Office establishments were then reduced from 15 to 20 per cent., and these rates have since prevailed in most civil and military departments in Western India.

All the Collectors consulted by the Commission in 1863-64 noted the adverse effect of the rise of prices on public servants with fixed salaries; one (Mr. Robertson, Tanna) estimated the effect as equivalent to a reduction of one-third from the higher and one-half from the lower classes of salaries, and most of the Collectors give similar testimony.

Acting on an old general rule, the Government of Bombay gave "batta," or increased allowance, to compensate for increased price of food, to all Government servants whose pay was less than 8 rupees (16 s.) per mensem,* and in December 1863 the Government of Bombay proposed an extension of the measure to all their servants receiving salaries not exceeding 200 rupees (20 l.) per mensem. The cost of this temporary relief was estimated at 39,600 l. per annum.

The Government of Bombay, in submitting this proposal to the Government of India, noted:—

1. The general reduction of all salaries in 1829-30 consequent on the fall of prices at that time.
2. The general rise in prices of late years.
3. That this rise seemed likely to be permanent.
4. That there was, in consequence, great and increasing distress among al, but especially the lower classes of Government servants, which materially impaired their efficiency.
5. That Government could afford no relief save by a revision, and, where necessary, an enhancement of salaries.
6. And the problem was, how such enhancement could be granted consistently with the requirements of sound economy?

The Government of India was asked to take these established facts into consideration, and to allow to the Government of Bombay power, within certain limits of total charge, to revise all permanent civil salaries under 20 l. per mensem.

The limit of 20 l. was named because it included all menial servants and police whose wants were very urgent, and in dealing with which the local Government might reasonably asked to be allowed some discretion, without awaiting the previous sanction of the Government of India to all details. The necessity for a revision and for some increase, equally applied to the higher salaries; but it would have to be made on somewhat different principles, and might await the previous approval of the Government of India.

The Government of India replied on the 5th February 1864, that the establishments of 1857-58 must be taken as the standard which could not be exceeded, and that no increase could be granted pending an inquiry into the duties and emoluments of *all* existing establishments.

The Government of Bombay replied in a letter, dated the 8th July 1864, that they were prepared to undertake such a general revision of establishments as was indicated by the Government of India, if on further consideration it should be found necessary; but before undertaking such an inquiry, they pointed out that a very close scrutiny and revision of district establishments had been made by Sir George Clerk under the financial pressure which followed on the mutinies, and that reductions to the greatest extent compatible with efficiency had been made and carried into effect as lately as between 1860 to 1862, resulting in a net saving of charge equal to 293,500 l. per annum, of which a large proportion was in permanent charges and establishments.

Saving in District Establishments :—		£.
Salaried and Hereditary Officials - -		14,600
Permanent Departmental Establishments -		128,000
Temporary Departmental Establishments -		150,900
	£.	293,500

The revision of the emoluments of the hereditary district officers was still incomplete, but had already effected a further saving of charge to the extent of 28,900 l. per annum in a portion only of the Presidency, and this revision, when completed, would effect some further saving.

The Government of Bombay argued that even before these reductions were effected the cost of administration in the Bombay Presidency was not, excessive, compared with other parts of India.

They

* The "batta," or extra allowance granted by the Bombay Government, 12 December 1863, where grain, the common food of the people, was dearer than 10 seers of 80 tolas per rupee (equal to about 20 pounds avoirdupois for 2 s.), was at the following rates:—

	Rs.	Rs.				Rs.
On salaries from 200 to 111 per cent.	-	-	-	-	-	5
" " 110 to 51 "	-	-	-	-	-	10
" " 50 to 31 "	-	-	-	-	-	15
" " 30 to 17 "	-	-	-	-	-	20
" " 17 and below "	-	-	-	-	-	25

The Revenue Commissioners and all subordinate officers were at the same time charged to consider and submit proposals for meeting this extra charge by reductions in the numbers of servants employed or by indicating new sources of income.

They referred to elaborate calculations to prove that the true amount of land revenue in Bombay, calculated as it would be in other divisions of the empire, was nearly 1,700,000 L. per annum, and that the true charge of collecting it was really less than $8\frac{1}{2}$ per cent., or 8 per cent. if the calculation were made to include excise and other items of revenue in the same manner as at Madras, where the cost of collection was calculated at 10 per cent., the per-centage in the North West Provinces and the Punjab being a little lower.

They further noted that the collectorates in Bombay were generally as large as the Commissionerships in the North West Provinces, and that in the smaller, more populous, and richer collectorates, the revenue was collected at a charge not exceeding 4 to $4\frac{1}{2}$ per cent.

For all these reasons, the Government of Bombay apprehended that any revision of establishments then undertaken was more likely to lead to an increase than to a reduction of numerical strength.

In support of this anticipation, they referred to the results of Mr. Rickett's inquiries when he was specially deputed in 1857-58 to revise the civil establishments of Bombay, at the same time with those of the rest of India.

He then found not only that it was impossible to effect reductions in Bombay, but that an increase of nearly 10,000 L. per annum of annual charge was necessary to place the establishments in Bombay on the same footing of efficiency as the most economically managed districts in India.

During the seven years which had elapsed since Mr. Rickett's report, prices had been steadily rising in a greater ratio than elsewhere in India, so that the necessity for such additions as he proposed had been increased.

Any fresh revision undertaken in 1864 could hardly, the Government of Bombay thought, have a result very different from that made with such care by Mr. Rickett in 1857-58. It would be desirable before valuable time were devoted to such a work that there should be some ground for hoping that the results, whatever they might be, should not, like Mr. Rickett's suggestions, be indefinitely set aside.

The Government of Bombay next referred to elaborate returns of the receipts and charges of 33 years to prove,—

1. That, with a largely increasing revenue, the administration of the Presidency had been conducted relatively with increased economy.

2. That, looking to the older Bombay Provinces (*i.e.*, exclusive of Sind, Sattara, and other recent acquisitions), the total receipts had increased in the proportion of from 1 in 1830-31 to 2·370 in 1862-63, while the charges had only increased in the proportion of from 1 to 1·604; also, that whilst the charges were to the receipts as 717 to 1 in 1830-31, they were only as 485 to 1 in 1862-63.

This had occurred, notwithstanding the unfavourable effect produced by bringing in, on both sides of the account, such items as, alienated revenues, allowances of hereditary officers, and other items of account formerly omitted, which increased the apparent charge to the full extent of the (nominal) receipts.* That the increase of land revenue in the older Bombay districts, excluding Sattara and Sind, and during the period in question, indicated increased material prosperity and development, requiring, however, increased expenditure, especially in the Judicial Department.

After summarising the results deducible from the report of the Commission on Prices, the Bombay Government noted,—

3. That since 1829, the prices of grain had about trebled, and were in 1864 nearly double the average prices of 1860 to 1863, while meat and other necessaries had nearly doubled in price since 1829, wages had increased 50 per cent., and the hire of carriage had risen from 200 to even 400 per cent. on some lines of road.

4. That the rise had affected the price of living to Europeans as much as to Natives.

5. That prices in Bombay were double or treble the prices in Bengal, and had risen in Western India to what in Bengal were considered famine prices.

6. That these facts speak unmistakeably to the privations which must be endured by all classes whose incomes are fixed, and only sufficient to provide the bare necessities of life: to which class belonged the great majority of the servants of Government, and most of the police.

7. That the rise in house rent chiefly affected the city of Bombay, where it was felt to such an extent that it was difficult to get officers to accept appointments in Bombay.

After reviewing the causes assigned by the Commission for the rise in prices, and stating that the demand for labour on public works had not much to do with it, the Bombay Government

* The following are among some of the larger items which have thus been brought in on both sides of the account:—

Appendix, No. 4. Government noted that the want of roads and other adequate means of communication was one of the main causes of high prices, which apparently had not yet reached their maximum.

The rise in prices and in the value of labour in itself the Government considered matter of extreme congratulation, but the consequent pressure on the public servants of Government urgently called for notice and relief.

No relief could be expected from reverting to the *status quo* of 1857-58, the precise period when Mr. Ricketts reported the establishments inadequate and requiring increase, and also the period antecedent to the present rise in prices. The pressure was not confined to the smaller incomes, but affected all but the very few on high salaries, such as heads of departments. Even their position had been very unfavourably affected as compared with 30 years previous, and many high appointments which formerly enabled the incumbent to save money, now barely paid his expenses of living.

The Government of Bombay concluded by suggesting that nothing would effectually meet the requirements of the case short of an increase, which was calculated at a decreasing scale from 30 per cent. on salaries under 500 *L.* per annum, to 15 per cent. on salaries above 2,000 *L.* per annum.

It was noted that this increase was not more than had been already given by private firms, banks, &c., in Bombay.

That the case of private soldiers, European and Native, differed somewhat from that of other Government servants, because the former drew rations at the expense of the State, and the latter got extra batta when grain was dear; but that as regarded officers, the necessity for immediate attention to the effect of high prices on their means of living was as imperative as in other branches of the service.

The same causes which had raised prices generally had largely aided to enhance the public income to an extent roughly estimated at 1,182,000 *L.* in the Bombay Presidency. These causes had scarcely begun to act on the land revenue of districts under 30 years' leases; but it would begin to be very perceptible in 1866-67, and would be progressive afterwards.

Finally, the Government of Bombay expressed a deep sense of the gravity of the position, which threatened a total disorganisation of the Government service, and they stated their own earnest desire to combine a due regard for the efficiency of the public service with the dictates of necessary economy.

Two returns were added, one of which showed, from information brought up to June 1864, that the increase of prices of food, and of most necessary articles of consumption, at three principal military stations (Poona, Ahmedabad, and Belgaum) had been continuous since the more voluminous returns of 1863 were sent in. The increase on many articles was as high as 50 and 60 per cent., and sometimes higher, and was balanced in but very few cases (such as oil and sugar) by a fall in price. The increase in the price of forage, and consequently of carriage, was still greater.

The other return showed that such increase of salaries as the Bombay Government considered necessary would involve, in all departments, civil, military, and marine, a total increase of charge exceeding half a million per annum (52,92,260 rupees).

No result followed this discussion, at least in the form of any general addition to the rates of salary in the lower grades of the service; nor has any general revision of establishments been since effected; but the facts recorded have an important bearing on the present financial state of India.

1stly. As accounting for much of the general discontent which has been remarked of late years among all classes of Government servants; and,

2ndly. As indicating a cause of future increase of expense, which will sooner or later become inevitable, unless there should be a fall of prices to something like their former level, which, judging from present appearances, is not likely to occur.

If the price of unskilled labour, and of living, for natives as well as Europeans, has risen to anything like the extent reported, it is clear that the cost of the army, and of all servants whose wages are regulated approximately by the wages of ordinary unskilled labour, must be raised, and an increase of the gross charge for such services can only be avoided by a diminution of their numbers, *i. e.*, by a recasting of establishments, which involves a very considerable change of system.

The following information regarding prices and revenue, before and after Akbar's time, is from Mr. Edward Thomas's "Pathan Kings of Delhi," 1871:—

Wheat (A.D. 1593 to 1605) was 3*d.* to 3½*d.* per quarter=28 lbs.; barley, 275½ lbs. for a rupee (2*s.*); salt, 55½ lbs. for ⅔ of a rupee; wages of bricklayers, 2½*d.* to 4½*d.* per diem; carpenters a little less; ordinary labourers and pickaxe-men from one-half to one-third of these wages.

Archers, 2½ rupees, and matchlock-men 6 rupees per mensem.

Akbar's Army.—His landwehr (Bunu) troops were reckoned at 4,400,000 men, besides horses and elephants. At 2 rupees each, a low estimate, the cost of these men would be 10 millions sterling. These were exclusive of the regular royal army.

Thomas

Bearing of this discussion on the present financial condition of India.

Present prices and public revenue compared with those under the later emperors of Delhi.

Thomas thus summarises the estimates of the land and other revenues of the Emperors of Delhi. Appendix, No. 4.

EMPEROR.	Date, A. D.	TOTAL REVENUES.	
		From Land Tax.	From all Sources.
		£.	£.
1. Férúz Shah - - - - -	1351-1358	-	6,850,000
2. Babar - - - - -	1526-1530	2,000,000	—

N. B.—These are the corrected amounts given in the “Corrigenda” at the beginning of the work.

Akbar claimed to have abolished vexatious taxes “equal to the quit-rent of Hindustan.” This included Muhammedan Jiziah or poll tax on unbelievers, a kind of income tax on all Hindoos. It was restored in subsequent reigns.

In Férúz Shah’s time (14th century) there was an overflowing abundance of precious metals. Timur’s conquests had depleted the country of money, which accounts for Baber’s diminished revenues (16th century). The country had recovered when Akbar succeeded; up to his time the land revenue was levied in kind.

Akbar made a 10 years’ money settlement, based on the averages of the preceding 10 years; this was the “geru,” says Mr. Thomas, of Lord Cornwallis’ settlement.

Some very interesting details of Akbar’s system of land revenue will be found in Mr. Clements Markham’s “Comparison of the Revenue System of Akbar with that of the English in India.”

Mr. Markham enumerates among the vexatious taxes abolished early in Akbar’s reign, “the capitation tax, poll tax on workmen, port dues, tax on cattle, market dues, tax on trees, and all exactions under the name of presents.”

[It is noteworthy that all these taxes were reimposed by his successors, and were general in Western India, in the Bombay Presidency, up to 1836-7, and in Sind still later; most of them are still to be found levied in native states:]

Before Akbar’s time the land tax (khiraj) was levied by taking a share of the actual produce (mookassimah); Akbar adopted the system of taking a fixed money rent (wuzefa), which was to be levied without reference to the produce, and whether there was produce or not.

He divided all lands into four classes:—

1. Poolej—cultivated every harvest, and never fallow.
2. Perowty—lying fallow at intervals.
3. Checher—fallow for four years together.
4. Bunjar—not cultivated for five years and upwards.

The principle of “wuzefa” was only applied to the two first classes; and to the second only when under cultivation.

The lands of each class were divided into best, middling, and bad; the produce of a beegah (five-eighths of an acre) of each sort was added together, and a third of that was considered to be the average produce of a beegah of poolej or perowty land. One-third of this average was the share of the State. On checher land only two-fifths of the average produce was paid, and less on bunjar.

The tax was paid either in money or kind, the money commutation being fixed at the average prices of 19 years, and the settlement was established for 10 years.

[Traces of this settlement were discoverable in the Deccan within the last 30 years, and in Guzerat to a still later period.]

Appendix, No. 4.

Mr. Markham sets down the whole of Akbar's (land ?) revenue in A.D. 1596, at only 9,67,93,519 rupees (9,679,351 l.). He thus contrasts the yield of particular provinces in Akbar's time with our own (1858):—

PROVINCE.	Land Revenue in Akbar's Time, A.D. 1600.	Under the English, A.D. 1858.	REMARKS.
	<i>Rs.</i>	<i>Rs.</i>	
1. Bengal and Orissa - - -	1,50,58,247	3,55,10,000	Mr. Markham says the assessment of Akbar on all land now under cultivation, would double the present revenue in Bengal.
2. Behar - - - - -	59,17,177		
3. Allahabad - - - - -	56,58,074		
4. Agra (exclusive of Scindia's present territory.)	72,33,340	3,82,41,930	
5. Delhi - - - - -	1,60,43,180		
6. Berar - - - - -	1,60,56,082		
7. Khandeish - - - - -	20,00,000	21,00,000	The English revenue of Guzerat is derived from only about one-fourth of Akbar's province of that name.
8. Guzerat - - - - -	11,09,190	91,75,510	
9. Lahore - - - - -	1,01,31,720	Punjab : 2,00,45,510	
10. Mooltan - - - - -		Sind : 29,07,720	
11. Tatta - - - - -			
TOTAL. - - - <i>Rs.</i>	8,97,67,010		

About one-twentieth was on an average deducted from the revenue in Akbar's accounts for "jageers," or rent-free lands, granted to public servants, and for "sayurghals," or assignments of rent for charitable purposes.

Akbar's returns were in "dams," 40 to one rupee.

Akbar's rupee was 174·4 grains troy, one-fiftieth more than the present rupee. This has been taken into account by Mr. Markham in comparing the English revenue with Akbar's.

Mr. Markham concludes from his comparison, that though the Government demand is now much lighter than in Akbar's time, the land tax in some districts produces nearly a third more than it did then. That the leases now are generally for 20 or 30 years instead of 10, as then; and in Bengal, &c., the present assessments are permanent.

[But, for an accurate comparison, it would be necessary to take into account the different purchasing value of the rupee in Akbar's time, as compared with the present. It would appear that in Akbar's time the rupee would purchase on an average about 115 lbs. of wheat, whereas it will purchase only about 47 lbs. now in Bengal, the cheapest province in India, and little more than half that quantity in Bombay.

A common day labourer could in Akbar's time be hired for about 1½ d. per diem; he would now expect about 4½ d. in Bengal, and 7 d. in Bombay. If the same proportions held good in other things, Akbar's revenue would appear to be comparatively far higher than ours.]

Introductory.

THE forests of India are preserved under the conviction that they are necessary for the general welfare of the country, both for climate, objects, and for a due supply of timber and fuel, independently of any annual cash profit which may be derived from them. It is not doubted however that, under skilled and careful management, a considerable surplus revenue will ultimately be obtained from this source. It may in course of time come to be, as the Government of India has expressed it, one of the most important sources of wealth for the inhabitants of the country.

As it is, the gross revenues have steadily increased since 1863-4, when the accounts were first separately kept; and although the expenditure has largely increased, it is because trained establishments were necessary from the damaged condition in which, through long neglect, the forests had been suffered to fall.

Including the Mysore and Berar forests (the profit of which does not accrue to the British Government), and taking Bombay and Sindh separately, there are 12 administrations, one for each province.

The Government of India has an Inspector General, who advises the Government generally on all matters connected with the forests throughout India. He has also under his control and supervision the forests of the chief commissionerships: Burmah, Oudh, Central Provinces, Coorg, Mysore, and Hyderabad. But he possesses little power of interfering with the forests under the Lieutenant Governorships (Bengal, Punjab, North Western Provinces), and no power of controlling and directing operations in Madras and Bombay, to which Sindh is annexed.

For each of these administrations an annual report, detailing the operations of the year, is prepared by the chief officer of each administration. These are carefully reviewed by the Governor General, or by the Governors or Lieutenant Governors.

An annual Forest Budget is also prepared and submitted to the Government of India, who scrutinise it with great particularity. While necessary establishments are liberally sanctioned, the greatest economy in management by controlling officers is insisted on.

These yearly reports and the yearly Budget Estimate are laid before the Secretary of State in Council as they arrive, like the documents belonging to any of the other subjects under the Revenue Department; and such circumstances as seem specially to require attention are pointed out, many of those notices being embodied in the reply which is sent to India.

One great item of expense now being incurred is for the demarcation of the forests, the vast areas of which have been very little known. It is a work of importance, as it will enable the Government to concentrate, and so to economise, establishments and labour. Not much has been yet accomplished, but the work is proceeding steadily in almost all parts of India.

The only legislative enactment for the administration of the forests is Act VII. of 1865, which enables administrations to frame rules for the protection and management of their forests, with consent of the Government of India. This Act has not proved sufficient, and another has been prepared, which has not yet passed into a law. It is understood that it will remove all legal obstacles to conservancy.

BRITISH BURMAH.

Burmah.

THE reports for 1868-9 and 1869-70 were recently received together. They are drawn up by Captain Seaton, the conservator, an officer of the Madras Staff Corps, who entered the

the Forest Department, and was one of the first to avail himself of the arrangements made in 1866 to enable British officers to study forestry in France and Germany.

The delay in sending in the report for 1868-9 arose from its containing an historical account of the forests of the province, and of the early measures adopted for their conservancy, the difficulty of obtaining the statistical data which it contains, and of printing it in Burmah.

Appendix, No. 5.

Burmah.

The following is a summary of the preliminary matter:—

The civil divisions of the province are Arakan, Tenasserim, and Pegu; the first two conquered in 1826, and the last, with double the population of the other two, in 1853.

History of forest administration.

Of the total area of 60,081,560 acres, that portion belonging to forests has been roughly estimated at,—

	Acres.
Teak producing forests - - -	1,534,080
Forest void of teak - - -	2,945,980
	<hr/>
	4,480,060 = 7,000 square miles.

And low-lying forest land and land occupied by—

12,845 towns and villages - - - 26,007,498 acres.

Of the 7,000 square miles 2,397 are estimated to be teak localities.

In Arakan, forest conservancy has hitherto been restricted to certain rules. It is a narrow tract of chiefly hilly country, extending over the western spurs of the Arakan Yoma Range, and is administered by the district officers for protecting the iron-wood tree. A report on the Arakan forests has been prepared by Mr. Schlich, but has not been sent on to the Government of India, pending the receipt of opinions called for upon it.

Xylia dolabrisformis.

The Pegu division is the largest and most important, comprising the whole area watered by the Irrawaddy from the frontier to the sea-board, as well as portions of the Sittang Valley, east and west sides. It contains the three main divisions: Rangoon, Tharrawaddie, and Sittang; as well as the Prome division; to which is attached the forests to the west of the Irrawaddy. The richest teak localities are situated on the hills between the Irrawaddy and Sittang rivers; those to the west being inferior in extent, and as respects the growth of the tree.

The Tenasserim division embraces the western side of the Salween from the Pahchoung to the Thoungyeen river, and the whole of the country between the Thoungyeen in the east, the Bay of Bengal on the west, the Siamese boundary on the south, as well as the lower portion of the eastern Sittang Valley.

The teak forests are under one divisional charge, and, though of large extent, are much less valuable in mature timber than those in the Pegu division.

The effects of the large consumption of firewood by steamers on the Irrawaddy, eng being the wood chiefly used, are beginning to be observed along the banks of the river.

The lower mixed forests contain bamboos, padouk (for cart wheels), pyukadoc (the iron-wood), pyima, kaunin. The Sittang forests supply thitnee, thitnu, thitpyoo, thingau. The Attaran, Dhamdamce, and Lhyneboay forests contain these woods, and also Kounghloo.

Of forest produce the authorities in some localities reserve the right of tapping the thitsee, or black varnish tree, and of collecting beeswax.

In July 1827 the Government sent Dr. Wallich to report on these forests, and directed that they should be held as Government property and protected.

In 1829, the attempts to work on Government account not having been satisfactory, Mr. Maingy, the commissioner, gave up the Attaran forests to private enterprise, under restrictions as to felling, and placing a duty of 15 per cent. on the timber.

In 1833 a small native establishment for planting purposes and conservancy was sanctioned.

In 1837-8 Dr. Helfer reported that the forests were being exterminated under the license system; and more stringent rules were drawn up by Captain Tremenhare, superintendent of forests, in 1841 and 1842.

In 1847 the Court of Directors prohibited the ceding of forest-holdings in perpetuity, and ordered the reservation of certain forests for Government.

In 1848 the present scale of duty was authorised: 4 rupees for each log of 5 feet girth, brought down the Attaran, and Rs. 2. 12. for each log brought down other rivers. Dr. Falconer was deputed to these forests in January 1849, and made a valuable report upon them.

On the annexation of Pegu Dr. McClelland was sent as superintendent of forests. In 1853 a notification by Colonel Phayre declared all the forest in the province to be the property of Government, and steps were taken to enforce this right.

Mr. D. Brandis assumed charge in 1856, and continued in function until he was summoned to Calcutta in 1863, and appointed inspector general. During his incumbency of the office he accomplished much towards putting the forests on a sound system of conservancy. Rules were promulgated in October 1856, which were revised in 1859.

Appendix, No. 5.

Burmah.

Among other points, they fixed the rate of duty to be levied on timber brought to Kadoe for export from foreign states. Mr. Brandis inaugurated a regular working plan, under which the teak forests were divided into six minor divisions, in each of which one-fourth of the available first-class trees were to be killed annually, it being reckoned that a rotation of 24 years would suffice to allow second-class teak (4 feet 6 inches girth) to attain to first-class size.

Subsequent rules were drawn up under Act VII. of 1865. In 1863 the Timber Revenue Establishment at Kadoe was amalgamated with the Forest Department.

In 1866 so little timber was left in the Attaran forests that it was resolved to grant permits for 30 years to such as had previously had permits to cut timber, called in the language of the country "letmhats," and even to allow them to purchase their plots.

Mr. Leeds succeeded Mr. Brandis in his charge of these forests in 1863, and Captain Seaton was appointed to them on Mr. Leeds' removal to Bengai, in 1868.

The present establishment consists of one conservator, three deputy conservators of two grades, eight assistant conservators in three grades.

Operations of
1869-70.

The forest operation of girdling, blasting rocks, and clearing streams were suspended, owing to the general financial difficulties of the year. As observed by the Chief Commissioner, this is unfortunate for a revenue-producing department, and the fact that the more spent on extraction of timber the more revenue would accrue; had money been granted it would have increased the revenue for 1870-71.

In the divisions of Pegu, valuation surveys, to ascertain the number of trees per acre, their sizes, and contents, were continued, together with experiments to ascertain their ages. The result obtained for the latter was that the average age of a first-class tree of six feet girth was shown to be 124.5 years. Topographical surveys and maps were in progress.

The clearings made in the year for plantations, in extension of the main teak plantations in the Rangoon, Tharrawaddie, and Sittang divisions, embrace an area of upwards of 513 acres, an increase of more than 96 acres above the area planted in 1869; 296 acres of this extent were near Toungthoo. The average cost of the latter is less than of the other plantations, about 2*l.* or 2*l.* 14*s.* the acre. The Government regard the progress in plantations, upon the whole, as exceedingly satisfactory; operations are being concentrated on three main divisional plantations.

In Rangoon division the plantations which have been made within the last three years cover 327 acres. A fire in the oldest of them did considerable mischief in the year.

Sesamum, cotton, chillies, sweet potatoes, and other crops are planted with the teak, and yield a small return. Shans are employed as cultivators. Karens and Burmese also, now that they begin to understand the system, show readiness to take to plantation work.

In the Tharrawaddie division the area planted seems to be 394 acres, and in the Sittang division 714 acres. Statements are given of the cost, extent planted, and of the average number of trees per acre.

The total area planted with teak in five years (1865-70) was 1,012 acres, at a total cost, excluding returns from sales of crops raised on the ground, of 6,473 *l.*, or about 6 *l.* 8*s.* the acre, as far as the work has gone. Former experimental plantations extend over 121 acres; and, with the addition for this year, 513 acres; the total extent is about 1,648 acres.

The Government deprecate a proposal advocated by the local administration to concentrate all planting operations near Rangoon. In some respects they admit that the plan commends itself, but they observe that it would be a pity to abandon or restrict the operations near near Toungthoo, where the work has been done at a low rate, and where it is probable that the cost will be still farther diminished.

The Government remark, "Good soil, the vicinity of water communication suitable for the transport of timber, and the facility for procuring the needful labour, appear to be the principal points to look to in the selection of land for plantations;" and annexed to the report is a correspondence of some length on the development of teak plantations, and the demarcation of reserves, reviewed by the Government; but the principal features seem to be shown in the report, which is of subsequent date.

The Government of India have expressed a strong opinion (as the Secretary of State has also done) adverse to a proposal for relying solely on planting, and giving up the maintenance and reproduction of the natural forests. They repeat that with so large an extent of country uncultivated, and so small a population, such a measure cannot be necessary. They say that, besides teak, there are valuable forests of iron-wood, catechu, thingan, and other trees, and they lay down the following principles, which it may be well to quote: "The reserves must be sufficient to supply the future requirements of the trade; existing cultivation and all private rights must be most scrupulously respected; but, all valuable teak forests and forests of other kinds, which are not occupied, and in which no private rights exist, must be reserved as State forests. Not to reserve such forests, because settlers may eventually desire to occupy the land for cultivation, would amount to a needless waste of a most valuable property, which has already yielded a very large net revenue to the State, and on the maintenance of which, to a certain extent, an important trade depends. The Government of India will be ready to grant the needful funds for the extension of plantations on a much larger scale than has been attempted at present, as soon as experience has shown that they can be formed and maintained at a moderate outlay per acre; but to rely on plantations alone would in every way be most imprudent; and under all circumstances, the natural resources of the forests must be carefully husbanded until the plantations arrive at maturity."

In the correspondence above referred to, the Government point out that whereas it is proposed to work up the plantations to 30,000 acres to secure an annual out-turn of 24,000 tons of timber, the yield of timber in the British territory has been from 33,000 to 52,200 independently of the importation of upwards of 100,000 tons, so that without the last-named sources of supply, 30,000 acres would only supply a small portion of the requirements of the trade.

Progress was made in 1868-9 and in 1869-70 in inducing the "ya" cultivators to plant teak along with their ordinary crops in suitable places, by which means it is hoped to resuscitate the older teak forests. The inducements which it is proposed to hold out to them, but which are not yet sanctioned, are a payment of 10 rupees per acre for each acre well covered with teak plants, and remission of capitation tax.

Steps have been taken to prepare for the establishment of railway fuel reserves, and to ascertain the quantity of wood available along the line of the proposed Rangoon and Prome Railway.

In the Prome plantations of 12 years standing, the average girth of the trees in different elevations is found to vary between 21·32 inches on level ground, to 15·70 on the crest of the hills; and the height from 48 to 38 feet.

Attempts have been made by Mr. Graham, with the assistance of two Karen lads who had been trained in the Neilgharries, to propagate the chinchona by cuttings. These promise to be successful, whereas the attempts with seed failed.

The introduction of ipecacuanha is also to be tried, when plants can be spared from Calcutta.

The demarcation of Government reserves is being urged on with a view of preventing breaches of forest rules, and of excluding the natives (who practice what is called "ya," or "tongya," i.e., burning the forest for the sake of cultivating one or two crops out of the ashes) from the forests. The destruction caused in the last year by this method is described in paragraphs 10 to 33 of Captain Seaton's Report. The Chief Commissioner lays great stress on the trouble which the interference with this rude habit of the people causes them. The Government of India, however, point out that the rules preventing this process have been in force since 1856, and that only within the last two years have any complaints been prominently brought to notice; that they are most anxious to encourage the increase of the population and of cultivation in Burmah; but that this can be effected without giving up the more valuable teak localities. The teak-producing forests are shown to form only a small proportion of the uncultivated land of the province, "and the preservation of a sufficient area of the more valuable forests is a matter of necessity, not a matter of choice." In parts of the country where no other land is available, it may be right to permit the extension of permanent cultivation at the expense of the teak forests, but in ordinary cases it is difficult to understand that there should be hardship and trouble to the people in prohibiting the extension of cultivation in teak localities. All the authorities are agreed on the necessity of proceeding as rapidly as possible with demarcation. As large a staff of officers as possible is to be employed in the Prome division this year.

In the year under notice the final demarcation of 25,800 acres, or 40·312 square miles was sanctioned by the local government, besides preliminary demarcations.

The yield of timber from British forests during the year 1869-70 was a fair one:—

	Logs.	Tons.
By Government Contractors and Government Agency in the Tharrawaddie and Rangoon Divisions.	13,594	12,644·9
Sleepers - - - - -	6,429	450·2
Seashore Drift and Miscellaneous - - - - -	3,355	3,055·8
By Permit Holders - - - - -	32,017	23,692·0
TOTAL - - -	55,395	39,843·6

The yield would have been as great as in 1868-9, which was an unusually large one, but a larger quantity of timber was "neaped" in the lower course of the various forest streams. The department realised Rs. 11. 13. a log net; according to usual rates, Rs. 4. 4. more than it would have done at a public sale, by converting 475 logs of second-class and unsound timber into 3,355 sleepers for the Bombay market at a steam saw-mill; 98 tons of planking and scantling were also obtained, which found a ready sale. Only the sound portions were converted into sleepers.

The timber from beyond the frontier, which paid duty at the Kadoe station, amounted to 81,936 logs, and 3,853 converted pieces, a decrease of 24,801 logs, and of 17,252 converted.

Appendix, No. 5.

Burmah.

verted pieces, from the previous year. This large decrease arose chiefly on the timber brought down by the Salween, and was owing to the disturbed state of the North Eastern frontier from the hostilities between the Karenees and Siamese Shans; a state of affairs which threatens to drive away the timber trade from Moulmein.

The foreign timber has decreased in three years from 68,221 logs in 1867-8 to 62,625 in 1868-9, and 44,262 in 1869-70. The British timber brought down by the Irrawaddy and the Sittang was also less than in 1868-9, owing to the very small rainfall in the upper forests having stranded many of the logs. The number of logs, however, including the balance of the previous year, cleared at the Kadoe station was 77,860, or 7,352 in excess of the quantity entered; the quantity left on hand in 1869-70 was refuse, chiefly unfit for shipment.

The average price realised by contractors and Government agency, timber per log was Rs. 28. 3., and per ton Rs. 29. 10.; and the net revenue Rs. 7. 1. the log, Rs. 13. 9. the ton. Permit timber gives a profit of Rs. 6. 7. the log, and Rs. 8. 11. the ton.

It is noted as satisfactory that the average yearly out-turn of timber of the nine years preceding 1868-9, was 10,735 tons; whereas the out-turn in 1868-9 was 21,330, and in 1869-70, 16,151 tons, nearly representing the yield of four seasons in two.

The financial results were favourable, although the Budget Estimate of expenditure had been exceeded by 4,460 *l*. The excess is accounted for by extended operations, the out-turn of timber having been exceptionally large in the two years, and proportionable outlay being required for transport. Plantations also and communications were higher. The excess over the Budget Estimate of receipts, 73,000 *l*., exceeded the excess in expenditure.

The cash receipts and expenditure of the year in the several provinces were:—

DIVISION.	Revenue.			Expenditure, inclusive of Direction.			Surplus:			Deficit.
	<i>Rs.</i>	<i>a.</i>	<i>p.</i>	<i>Rs.</i>	<i>a.</i>	<i>p.</i>	<i>Rs.</i>	<i>a.</i>	<i>p.</i>	<i>Rs.</i>
Prome - - - -	38,000	5	-	10,540	15	-	27,460	6	-	—
Tharrawaddie and Rangoon -	5,35,148	-	6	3,39,641	7	6	1,95,506	9	-	—
Sittang - - - -	92,305	1	6	34,326	-	9	57,979	-	9	—
Salween - - - -	1,15,410	16	4	13,037	12	-	1,02,373	3	4	—
Kadoe - - - -	2,04,011	5	-	17,835	12	-	1,86,175	0	-	—
TOTAL - - - <i>Rs.</i>	9,84,875	11	4	4,15,381	15	3	5,69,493	12	1	—

From the surplus, 56,949 *l*., is to be deducted for allowances, re-funds, and drawbacks, 422 *l*., leaving the net revenue:—

	<i>£.</i>
Home, or Forests - - - -	44,455
Kadoe, or Foreign - - - -	12,071
	56,526
Or 21,027 <i>l</i> . over the estimated Budget surplus.	
But from this must be deducted the less value of Stock.	5,572
Leaving - - - <i>£.</i>	50,954

As the actual surplus of the year's operations.

ODDH FORESTS.

Oudh.

THE Report is by Captain E. S. Wood, the conservator, who left India on sick leave shortly after he had sent it in.

The area of the lands under the department was much the same as in the previous year, the only additions being 3,703 acres in Kheree, and 2,447 in Gondah, both made over for fuel reserves.

It is intended to transfer to the department certain tracts in the Kheree district south of the Sardah, which many years ago were granted for cultivation, but in which the conditions of the grants have not been fulfilled, the area is estimated at 182,737 acres, or nearly 285 square miles. Orders, it appears, have lately been issued for making over 10,000 of these acres. When it may be inexpedient to disturb the present cultivators, they are to be continued under leases from the conservator. The whole tract is said to be better suited to the growth of *sâl* than to cultivation.

The forest establishment is beginning to work "pretty fairly," but at present there are few really good men as rangers. Captain Wood, however, hopes in time to find some.

Conservancy is being introduced very gradually indeed into the province, with regard to the

the requirements of the population, and their prescriptive rights. Where these have not existed before, they are not to be created. A commission is to be appointed to settle them, but it is useless to appoint one until after the boundaries have been finally decided. It is the minor forest produce which is chiefly affected by such claims. This year it was leased as in the previous year. The talookdars in the neighbourhood are generally the contractors, so that even if they do not keep to the terms few complaints are made to the officers.

Appendix, No. 5.

Oudh.

The miscellaneous forest produce was leased for 7,479 *l.* instead of 5,535 *l.* A larger amount would have been obtained if the Rajah of Bulrampoor had not had a farming lease. When the regular settlements are completed, a better arrangement can be made. The same sums may not be obtained when most of the dead, fallen, and standing trees have been taken out. On the other hand, the smaller wood will be more valuable, as there will be a market at Byranghat for fuel, and the navigation is being improved.

The rules of sale for forest produce in Oudh are appended to the report; separate leases must be taken for the three different kinds of produce:—

1. Dry Wood.
2. Grazing.
3. Minor Forest Produce.

The Government reserve to itself the right of catching wild elephants.

The sale of mowah, fruit and flowers, takes place separately in March or April.

The third article comprehends the collection and sale of all gums, resins, wax, honey, lac, fruits, and seeds (except those of the reserved woods and mowah), flowers (except mowah), the unclaimed skins and horns of all animals dying in the forest, shells, minerals, prepared or unprepared, grasses for ropes, thitching, and domestic purposes; and roots, stems, leaves of plants not classed as reserved.

The revenue survey is still incomplete. Major Anderson has been making arrangements during the cold weather for determining the boundary which follows the watershed between Nepal and Oudh in the Gondah and Baraich divisions.

Valuation surveys to ascertain the number of trees per acre have been taken for the last three years in the Kherce division. The acreage surveyed in that time (544 acres) shows 3.65 first-class, and 5.534 second-class trees the acre, with plenty of younger trees to take their places.

In Baraich the surveys show a want of young trees, but when the first-class trees have been felled and the block closed for some time, seedlings may spring up.

Experiments also went on to ascertain the ages of trees.

Lines were cut to stop fires in the forests, sowings were made of khair (*acacia catechu*), a lately reserved wood, and of sissoo. A plantation of the large hollow sort of bamboo was made near the Sohelee, and is doing well. The Government of India commend this measure, and say that the bamboos should be cultivated in all forest districts, where the conditions are favourable, and they are not indigenous.

One of the most important operations of the year to the future profit of the forests was the rendering the Sohelee river available for the transit of timber, by removing impediments from its course; considerable progress was made towards this object. The use of the Sardah, a most unmanageable river for the purpose, can now be dispensed with. The effect has been already to reduce the rate of contract; half the number of carts can be dispensed with, or double the work done with the same number; and, even putting aside the less cost of rafting by the Sohelee, about 1,000 *l.* annually will be saved in land carriage. Moreover, the officer in charge of the division can himself supervise the work, which he could not well do on the Sardah, and not at all on the Kunhout route.

Captain Wood reported that very little expense would make the roads fit for traction engines, which he hoped ere long to see doing the principal part of the carriage of timber and fuel. Acting upon this suggestion, the Government of India requested the Secretary of State to commission Captain Wood to inquire into the possibility of obtaining a suitable engine in England. This has been done, but his report has not yet been received.

Little timber was brought out in the year owing to the change from the Sardah route; but the stock was much increased.

Two thousand nine hundred and forty-two trees were felled, and some more which were to be reckoned in next year's account. The timber promises to be good, but the logs had to be cut to suit the carters, who will not cart them beyond a certain length; 3,193 logs were carted out of the forests during the year.

Captain Wood thinks that the estimate of the annual yield, which in his last report he had fixed at 3,000 or 4,000 trees, can be very much increased, when more data as to the growth of trees have been obtained.

A plan of timber operations for 1870-71, and 1871-72, is added to the report. For an expenditure of 5,000 *l.* in the last of these years, he expected to sell 6,925 *l.*

But little timber was brought from Nepal during the year.

Appendix, No. 5.

The financial results for the year were:—

Oudh.		£.
	Timber at Depôts - - - - -	2,422
	Miscellaneous, including sale timber removed by purchasers, permit fees, grazing dues, sale of fruits, &c., confiscated timber, fines and forfeitures - - -	8,260
		10,682
	Expenditure - - - - -	10,517
	Balance - - - - -	165
	Excess of assets at end of year over those at commencement	4,355
	Profit of the Year - - - £.	4,520

The officers employed under Captain Wood were Captain Losack, Mr. Ponsonby, and Mr. Forrest.

CENTRAL PROVINCES.

Central Provinces.

THE forest report on the Central Provinces for 1869-70 is by Mr. Jacob, officiating for the conservator, Captain Doveton, who is at home on sick leave.

The only important operation of the year was the supply of 50,000 sleepers to the Great Indian Peninsula Railway Company. The exertions and arrangements made to effect this operation within a limited time are much commended; but they absorbed much of the time of the officers, caused a considerable expenditure on forest roads, and, from the limitation as to time; the price paid for them, Rs. 5. 12. 1. a sleeper, did not cover the expenses, accurate results are to be given when the transaction is quite closed. It is stated that there were 4,450 trees felled, which yielded 32,647 sleepers, equalling 130,588 cubic feet of timber, on an average of 29 cubic feet per log, and it is calculated that, if removed in log, this timber would have yielded 45 cubic feet per tree, or nearly half as much more than the quantity represented by sleepers. 22,774 first class sleepers were landed at Jubbulpore by the 31st of March.

The Sâl Forests of the Meikul and Kymore Ranges are those from which these sleepers seem to have been chiefly brought, on which account expense in opening communications was incurred.

When the demand for timber has sufficiently expanded, the Nerbudda (most of the tributaries of which flow through the most heavily timbered portions of the northern division) will, when two obstructions between Mundla and Jubbulpore are removed, form a most valuable artery for the export of timber.

The forests are partitioned into five divisions: northern, southern, eastern, western, and central. They are divided into reserved and unreserved.

A report by Mr. R. Thompson, giving a geological and statistical description of the country comprised in the northern division, was sent in, of which Mr. Jacob cites the chief points. There are eight reserves in this division.

Operations in the central division were chiefly in connection with the final demarcation, and administration of Sautpoora reserves. Progress has been made towards rotation management.

In the western division, there are seven reserves, which cover an area of 2,000 square miles. Frequent changes of officers had hindered the enforcing of systematic conservancy. The proportion of timbered country is 1.8 acres per head of the population. It is stated that Burmah teak is procurable at Bombay at Rs. 1. 4. (2 s. 6 d.) per foot, and that the cost of delivery would not increase the cost more than 4 annas a foot. The former rates for the timber from the Nerbudda Valley (from 8 annas to Rs. 2. 8.) cannot compete with the Burmah teak at the price mentioned; and much of the stock is of an inferior quality, and deteriorates rapidly. Mr. Jacob therefore advocates quick sales at lower prices.

The general situation of the eastern division, and the remoteness of the more valuable areas of forest, and various circumstances, combine to narrow the sphere of operations. The time has not yet come when the large timbered areas of this division can be worked remuneratively.

Fires were excluded from the Hathibaree Forest.

The Panabaras, a leased forest, presents a very favourable field for professional management since the whole of the boundaries has been clearly and distinctly defined.

In the southern division operations were confined to the enumeration of growing stock and the collection of timber in depôts from the Aheree Forest. The survey preparation of maps, enumeration of timber, and experiments to ascertain growth and decay have all been brought to a close. The number and size of trees in the Bemaram and Mirkulloo Forests are given. They contain teak and sheshum (sissoo).

Plantations,

Plantations, as the following Table relating to the three principal ones shows, are very expensive, as yet, in the Central Provinces.

Appendix, No. 5,
Central Provinces.

Division.	Plantation.	Area, Acres.	Number of Plants.	Total Cost.	Cost per Acre.
				<i>Rs.</i>	<i>Rs.</i>
Northern - - -	Garhakota - - -	15	6,982	4,383	292
Ditto - - -	Aheree - - -	56	41,190	13,059	240
Western - - -	Bankaburda - - -	40	18,418	7,866	196

The total outlay on Plantations in the Central Provinces appears to have been from 1864-5 to 1868-9.	<i>Rs.</i> 34,622
Add outlay of 1869-70 - - - - -	21,327
TOTAL - - - <i>Rs.</i>	55,949

In the Eastern Division, mention is made of a plantation of 190 acres, on which about 86,000 trees had been planted. Statements, showing the distribution of this expenditure and other particulars, are called for.

Fires have been excluded for three successive years from two reserves (Jugmundel 53 square miles, and Choohareegogur eight square miles); and for five years from one (Boree, 62 square miles).

Marked success attended the management of the unreserved forests. The total receipts for the year were 31,489 l. against 24,916 l. in 1868-9, an increase of 6,573 l. The increased income it was remarked, in a year succeeding one of unusual pressure, is evidence of prosperity among the agricultural classes. The Chief Commissioner, Mr. Morris, ascribes this favourable result also, in some measure, to a better system of management adapted to the conditions and circumstances of the several districts.

The former practice was for the deputy commissioner to lease out annually the right of working these forests. This threw them into the hands of speculators, and led to oppression of the agricultural population. A system of commutation has been adopted, by which the right of collecting the principal articles of daily consumption, grass, fuel and small timber for domestic and agricultural purposes, is secured to the agricultural population by payment of a fixed annual rate.

● Farming leases sold by auction prevail in some districts; and, in some, licenses are issued.

The Government of India issues a caution against allowing prescriptive rights to spring up.

The principal articles of this produce are lac, gum, resin, dyes, Mowah, Rosah, edible fruits, grazing dues.

In the Godavery District, Colonel Ashburner speaks with much confidence (after the defects of the system which has prevailed are corrected), of realising a large revenue, and throwing open to the public, large quantities of various produce, hitherto not turned to such good account as might be.

Captain Forsyth is quoted as giving valuable facts as to the prospects of increase in the export trade of forest produce by the railway.

The Government instance Burmah, to show that the working of the forests can be as economically performed by Government as by private agency.

The Chief Commissioner concluded his review by a proposed re-organisation of the department.

1. By allowing no timber operations for some years to come.
2. By reducing the area of the reserves.
3. By re-distributing the divisional charges.

Government await a full report on these subjects from the Chief Commissioner. In commenting on the report to the Government of India, the Secretary of State cautioned them not to give up reserves precipitately.

The financial results of the year were not favourable, although the receipts amounted to a larger figure than was reached in any previous year; but the large increase of charges

Appendix, No. 5.
Central Provinces.

under conservancy and working, due almost entirely to timber expenses, more than counter-balance this large amount.

Charges - - - - -	£.
	47,218
Receipts :	
Reserved forests - - - - -	£.
	4,999
Other revenue - - - - -	1,089
Unreserved forests - - - - -	31,490
	38,178
Cash deficit - - - - -	9,140
Less value of Stock at close of Year -	1,884
	11,024
Excess of outstanding sums in 1870 beyond 1869 -	27,771
Net Profit of the Year - - - - -	£.
	16,747

The large outstanding sum is owing to the close of the financial year being just the season when operations are incomplete, and when there are large balances, both in the shape of income for remunerative work, and advances for its performance.

The Secretary of State in his reply (6th February 1871) pointed out the large increase of expenditure under the head of timber expenses, ascribed, as before stated, to the provision of sleepers within a given time ; and directed that losing contracts of the kind should not be entered into in future.

COORG.

Coorg.

The Annual Report for the forests of Coorg for 1869-70 has not yet been received. The following particulars are taken from the General Administration Report of that year :—

The whole of Coorg proper is dotted with stately forests. The trees, however, attain their greatest magnitude on the declivities of the ghats. It is a stupendous ridge, not broken or rocky, and covered with a rich stratum of mould, in which trees grow to a prodigious size. There is a wide extent of forest on the eastern boundary, but its produce, though not scanty in growth, does not equal that on the chain of mountains. Bamboos in all varieties and of the greatest excellence, are found everywhere ; rattans and reeds, creepers and rare plants, frequently form an impervious underwood.

An interesting list of trees useful for timber, fruit, gums, bark, and fibre, too long to quote at length here, is given. The best known are the jack, blackwood, areca, mangoe, tamarind, and dammer trees.

The conservator is Lieutenant Van-Someren, who is also conservator for Mysore, and there is an assistant conservator, Mr. E. Ludlow.

The quantity of timber felled during the year was :—

	Number of Trees.		Logs.
Teak - - -	443	Yielding - - -	836
Houné - - -	168	- ditto - - -	271
Blackwood - -	9	- ditto - - -	9

The cost of felling is calculated at Rs. 1. 3. per log. The teak logs are said to contain about 20 cubic feet of wood each.

The

The sandal trees have been taken up with their roots, and the quantity collected is thus given :—

Appendix, No. 5.

Coorg.

	Kandis.*	Maunds.	Seers.
Billets - - - -	268	10	9
Roots - - - -	99	13	30

* The Coorg kandy weighs 550 lbs. English.

The cost of collection varies in north and south Coorg, being from 6 to 7 rupees the kandi in the former, and from 5 to 11 in the latter, labour being more expensive in the south and the billets having to be carried long distances to the carts.

Only 183 logs of teak and three of honné were sold during the year; the teak fetched a fair price, Rs. 1. 2. 5. and upwards per cubic foot. Thirty-eight logs given to the Public Works Department are not included in the above. Timber and bamboos, worth 1,008 rupees, were also given for the lines of the 8th Regiment, N. I. Further sales were postponed as there is a large stock in hand.

Four hundred and fourteen kandis of sandal wood in billets, and 114 in roots, were sold at an average price of Rs. 86. 1. 5. a kandi.

The proceeds from small wood and bamboos are smaller than in the previous year, and will be smaller, as two of the jungles are worked out, and the Coorgs are underselling the departments.

The teak nursery at Tittimatti is to be abandoned as the soil is unsuitable.

The plantation at Karmád is thriving; 50 acres cleared in the previous year were planted, and more have been cleared. Preparations for forming a plantation at Kutampilli have been made.

The attempt to rear sandal trees has failed. In future, seeds are to be sown broad-cast in selected land covered with light brushwood.

The receipts from fees for licenses for felling timber were 5,819 rupees.

The subedars grant licenses to fell 15 trees. The fees vary according to the kind of tree, from 3 rupees to 20 rupees the tree. The highest rate is only paid for poon trees, sent to the Western Conkan for masts of ships.

The following are the charges for other reserved trees: blackwood anjeli, 10 rupees the tree; ebony, honné, and trupu, 6 rupees the tree.

Shelter was provided for coolies.

The assistant conservator complains of the small remuneration of the native subordinates of the establishment. Complaint is made of the want of forest rules, in consequence of which the forest resources of the country are much impaired. Sandal wood has become scarce in south Coorg.

No survey or demarcation of reserves has been commenced. All the roads are open and there is no guard to check smuggling except in two of the ghats.

Great attention is being paid to the cultivation of cardamoms, on which Mr. Ludlow has published an instructive little manual. There are 128 cardamom jungles, some comprising large tracts of land.

The financial results of the year (Actuals taken from the Budget) were :—

	£.
Receipts - - - - -	10,815
Charges - - - - -	3,308
Surplus - - - - £.	7,507

PUNJAB.

THE Punjab reports are in arrear. It is known that the Government of India has called attention to the circumstance, which doubtless proceeded from the great amount of work thrown upon the officers of these forests, in order to furnish timber for the construction of the Government railways, and to provide fuel to work them when constructed.

The following particulars are taken from the Administration Report for 1869-70, which gives an abstract of operations and results.

It divides the forests and woodlands now under the charge of the department into two classes :—

I. The more important forests and rukhs, the property of Government, in which it possesses paramount forest rights; and,—

059.

4 L 3

II. Forests

Punjab.

Appendix, No. 5.

II. Forests leased from native states.

Punjab.

The first of these is again partitioned into nine classes, according to district and character:—

1. The forests of Hazara, consisting of cedar and various conifers.
2. The forests of Rawalpindi, consisting of chil (*Pinus longifolia*) and deciduous trees, including fuel brushwood.
3. The forests of Kangra, consisting of chil and deciduous trees, with fuel brushwood and a little sál.
4. Tracts of chil in Gurdaspore.
5. Chil forests and bamboo jungles in Hoshiarpore.
6. The cedar and coniferous forests of Kullu.
7. Ambála district, small sál tracts of the Kalesar Dhur.
8. Sissoo forests of the Kachi on the Indus.
9. The fuel and timber tracts, known as the rukhs of the plain districts.

The leased forests, Class II., are those of the Chamba State between the Chenab and Ravee, mainly cedar, with various other conifers and some deciduous trees.

The tracts of Bussahir and Puri in the valley of the Sutlej and its tributaries.

The department has also charge of a large division, formed of extensive fuel plantations, extending along the lines of the railway from Changa Manga, in the Montgomery District, to Delhi.

The general control and direction is under a conservator, aided by an assistant conservator, who superintends the office while on tour, and has charge of the forest accounts.

The tracts are divided, for administrative purposes, into eight divisions and ranges, including fuel plantations and reserves.

Complete rules for the management of depôts and sales have been issued for 1870-71.

The chief work of the officers of the Upper River Divisions, besides mere felling, is the custody and conservancy of the forests, the prevention of grazing and firing of forests, and the securing reproduction, which is generally effected by protecting the growth of the seedlings, which spring up by thousands in most places, as soon as the original forest is cleared.

The "rukhs" consist for the most part of brushwood, or rather a thick stunted growth of various species of acacia, prosapis (jhund), karil (leafless caper), &c.; but, in places, more valuable growths of kikar (acacia Arabica), shisham (*dalbergia sissoo*), and, in the salt range, olives and box. These rukhs are gradually being made over to the care of the department; nearly 400,000 acres were transferred during the year.

The entire supply of fuel and timber for the Northern State Railway has been entrusted to the department, and the powers of the officers concerned are taxed to the utmost.

In order not to tax the hill forests unduly, recourse is also had to the forests of Cashmere, and arrangements have been made for a large supply from the Maharajah's forests. A considerable rise has taken place in the prices of both deodar timber and fuel.

The return of fellings for 1869-70 gives a total on the five rivers of 7,079 trees, and 60,161 logs. The receipts in the several depôts show 29,272 pieces, containing 501,059 cubic feet; 1,590 acres have been added to the previous area of plantations of 6,275 acres. The cost of maintaining the old, and planting the new, was 7,783*l*.

The financial results are given in the following figures:—

Assets at the beginning of the Year.

	£.	£.
Value of timber, and other stock - - - - -	8,389	
Outstanding on account of sales and excess payment to contractors -	15,064	23,443
		71,306
Expenditure during the year - - - - -	-	04,809
Receipts during the year - - - - -	39,413	
Assets at the end of the year—		
Value of timber - - - - - £. 34,059		
Outstandings - - - - - 20,383		
	54,442	93,855
Loss on Year's operations - - - £.		954

These sums show only the actual transactions in timber brought into the depôts, but the value of timber in various states in the forest is very much in excess of what it was at the beginning of the year, and the purchase of some of the stock has swelled the expenditure.

NORTH WESTERN PROVINCES.

North Western
Provinces.

THE report is by Major Pearson, the conservator. Much activity prevailed throughout the department during the year. The principal timber operations were :—

1. *Säl Fellings in Kumaon, under Mr. Greig.*—These were very extensive, and are divided under two heads : the removal to the depôts of 1,045 logs, and 12,000 kurries,* from the Kooria Kurruk forests, which were felled and cut in the previous year, and the felling, logging, and conveying to depôt of 2,500 trees in the Droogadch forest. The work is represented by close upon 200,000 cubic feet of timber being brought to depôt, of which one-third was in a prepared state. There is a demand for kurries, which fetch a good price in the native market, and which can be made out of the unsound and crooked trees, which it is desirable to remove from the forests.

* Small squared
logs

2. *The Auction Sale in Gurhwal.*—In the Semulchour depôt, there were about 62,000 cubic feet of very fine sâl timber from last year. The result of the auction in January was not successful, as only a few *bond fide* purchasers appeared, and they were in league. As there is not much sound timber left in the inaccessible parts of the Gurhwal forests, and this timber is exceedingly fine, it is determined not to part with it hastily.

Doubt is expressed by the Government of India whether, considering the difficulty of disposing of the timber, the general operations of the year have not been on too extensive a scale.

All the logs in the Bhagarutty forests put into the river, 5,765, have been made over for sleeper works ; they will come into account next year. Only 400 out of 2,000 cheer logs at the Hurdwar depôt sold at a low price ; it is supposed, because the dealers do not like the introduction of new articles, preferring to keep up prices.

3. *The Supply of Timber to Chuckratta.*—There was a very large out-turn of this work, the whole arrangements for which devolved on the Forest Department.

	Planks.	Kurries.	
Deodar - - - -	44,584	20,190	= 64,710 cubic feet.
Raice - - - -	20,564	7,209	= 31,206 „
Sawn up by Captain Murray	15,606	459	
	80,754	27,858	95,910 „

There were besides nearly 4,000 bullies given to the Chuckratta works. The whole of this wood had to be prepared and carried on men's backs from the forest to Chuckratta, and it required the closest attention to keep the hill men together.

4. *The Sleeper Operations on the Tonse and Bhagarutty Rivers.*—The preparation of these sleepers for the Delhi and Rewarree Railways was really the most important work begun during the year. It was carried on under Captain Murray in the Tonse, and in the Bhagarutty by Mr. Wilson (as a contractor), under Mr. O'Callaghan. On the Tonse, the sleepers have to be cut up in the forests and carried to the river ; 5,127 had been sawn up to the end of June, and carrying had been begun. Logs for more than 35,000 more were collected in the sawing depôts. In another forest 3,500 trees had been marked, and were being felled and logged ; and at Datmeer, the highest deodar forest on the Tonse, 2,000 trees had been felled and were being logged, while 524 had been put into the river. Great difficulties embarrass the work, scarcity of labour, difficulty of keeping up supplies of food for large gangs of workmen, in a country without roads, and the bites of the "Potoo Fly" are a scourge to the plains-men ; 180 pairs of sawyers were driven back by the last-named cause to the plains. The work of the hill-men is inferior.

In the Bhagarutty forests the works went on very satisfactorily. Arrangements were made by which it is hoped that the out-turn of the season will be from 50,000 to 60,000 sleepers. At this rate it is expected that the sleeper work for the State railways will be successful.

Another set of sleeper operations has been going on for cheer sleepers in the August moondee forests for the East India Railway Company. Here also the sleepers are cut in the forests, and the work has been successfully performed by Mr. Scott, on behalf of the Company ; 44,000 sleepers have been turned out, and about 9,000 trees girdled for next year. The sleepers seen by Major Pearson were very well sawn, and in excellent condition.

Operations for the exclusion of fires from the forests were successful in the Dhera Dhoon, but they were on a small scale. The Kumaon and Gurhwal forests again suffered damage.

Village, grazing, and other rights, are not to be allowed except where prescription really exists,

Appendix, No. 5.

North Western
Provinces.

exists, but the Government state that the best plan will be to allot to new villages limited and well-defined forest tracts for grazing and the supply of forest produce.

The uncertainty of boundary lines in the Doon is noticed, and the Government of India lay it down that a clear demarcation of boundary lines is the first condition of successful forest administration. The boundaries in the Doon are the only ones which still require to be defined. The collection of dry wood has realised a large sum, but it has given an excuse for the destruction of trees, and the perpetration of mischief in the forests. Major Pearson is inclined to recommend that it should be only exercised under supervision, and within defined limits.

The plantations of Australian and fruit trees at Raneekhet are going on very favourably, and in some cases have shown wonderful progress, although some of the fruit trees from England died from the heat on their way up the country. If Raneekhet is to be a large station, the successful introduction of the rapidly growing Australian trees is a matter of the highest importance, in respect not only to beauty but to supply of fuel.

The question of covering the bare hills at Chukratta, and of the supply of fuel for the cantonment is more difficult. Some of the Australian trees are doing very well; Major Pearson, however, fears that the climate will prove too severe for them without greater care than it is possible to bestow on a large number. He expects that the only way of supplying the cantonment in a few years will be to complete the cart road and send the wood up from the Doon. This view is supported by the Lieutenant Governor.

The Khadir (low alluvial land) of the Ganges has been examined and favourably reported on by Mr. Colvin, with a view to fuel plantations for the railway. Dr. King remarks of the Doon that, beyond the maintenance of the forest nursery begun by Mr. Colvin, no planting was done during the year. The nursery is being continued, and arrangements made for sowing seeds of Australian trees. He observes, "The increasing scarcity of firewood, for the supply both of local wants and of the railways, is a serious matter. In the Doon itself the tea planters require a large quantity, and the manager of one of the largest gardens tells me that the Company's jungle having been all felled, he is under the necessity of cutting down mango groves, and indeed it is evident that the destruction of the mango groves, which lend so much to the beauty and salubrity of the Doon, is only a question of time. The inexorable demand for wood is being met simply by cutting. Hardly anywhere is planting being carried on. However, this wholesale destruction of growing timber is but part of a large question, the gravity of which, as affecting climate, rainfall, and fertility of the soil, is hardly as yet recognised."

Marked improvement is shown in most of the divisions under the head of minor produce. This, however, was not the case in the Doon, where there is evidence of strong corruption having prevailed among the subordinate forest establishment, now the subject of criminal proceedings in the courts of the district. The Government call for further inquiry, and a report upon the whole case when completed.

Mr. Greig mentions an increase in receipts from Rottlera Tinctoria, Kamela Powder, a vermifuge and also a bright yellow dye; that he had sent eight maunds of this drug for 20 l. to Messrs. Hanbury, of Plough-court. Dr. Cleghorn reported to the Secretary of State, in February 1869, that Mr. Hanbury had told him that the best consignments he had received of this drug were obtained from the forest officers direct.

The canal plantations are omitted from the Report, having been re-transferred to the Public Works Department.

The financial results of the year were:—

	£.
Receipts - - - - -	64,836
Expenditure - - - - -	38,365
	26,471
Less Value of Assets and Liabilities at the end of the Year	1,827
Net Revenue - - - £.	24,644

By the end of the working season a large additional quantity of timber had been brought home and stored in the Kumaon depôts.

The forest officers named as employed during the year are Mr. Greig, Mr. O'Callaghan, Mr. Colvin, Dr. G. King (now Superintendent of Botanical Gardens, Calcutta), Captain Murray, Mr. Bieren, Mr. Thomas, Mr. Grant, Mr. Bagshawe, Mr. Henman, and Mr. Moir. The last two were from the first batch of young men who had been trained in France for the forest service. Major Pearson laments the death of the former by a fall down a precipice. He had shown remarkable intelligence, and had given great promise of future usefulness. Mr. Moir is well spoken of for steady work.

Major Pearson states that "perhaps the greatest step in the way of real advancement in forest management during the year" was the appointment of an officer (Mr. Colvin) to the charge of head quarters and the supervision of the accounts; the benefit, he says, is most evident in all the divisions. "It is impossible for any item of doubtful expenditure now to pass without criticism." Praise is given to the head assistant in the office, Mr. Jeffries.

BENGAL.

Appendix, No. 5.

Bengal.

The Report on the Bengal Forests for 1869-70 is by Mr. Leeds, the Conservator, who returned from sick-leave on the 2nd of May 1870, receiving charge from Lieutenant Stenhouse, who had been acting for him.

With the report is forwarded a memorandum by Mr. Mann, the assistant conservator, on forest survey in the Assam division. A summary of this paper is given in Mr. Leeds's report. The inspection embraced the Luckimpore, Subsangor, Naga Hills, Nowgong districts, and the forests in the Khasi and Jynteah hills. This inspection was the principal operation of the year. These forests contain a great variety of timber of valuable kinds. In the most accessible places they have been much drained, especially on the left bank of the Bramahpootra, to supply the saw-mills of the Upper Assam Company on the banks of the Debronuddy, whence the North East Saw Mills Company has derived its supply; and on the Lower Dehing, where the forests have been heavily worked by the Dehing Saw Mills Company.

In the Nowgong district, "jooming" (the same as "ya," or "tongya," in Burmah, and "koomrec" and "dalla" in the south of India) has much damaged the forests.

The importance of the Soom forests for the production of the Moogah silk, one of the most profitable occupations of the inhabitants of the Luckimpore district, is again brought to notice. The Soom forests in the Subsangor district are also extensive and valuable.

The area of valuable forest tracts in Assam is roughly estimated at 4,000 square miles, so far as the knowledge of them as yet extends. Tracts will be selected under notification in the Gazette, and declared Government forests; and, out of these, picked tracts are to be selected as Government reserves. Acquaintance with them is as yet too imperfect for any plan of working them to have been formed.

The reserved tracts of forests now in charge of the department are:—

In Assam, the Nambur forests, about 25 square miles.

Dhunsiri " 720 "

In Sikhim, Bhootan, tracts in the Eastern and Western Dhoors covering 2,175,112 acres. These tracts are said to contain a population of 67,016, of which 16,733 are Hindoos.

The demarcation of reserves was to be begun in the season 1870-71. The boundaries of the reserves in Sikhim and Bhootan were fixed.

The Rungbool plantation was increased by 180 acres. The teak plantation at Bamun-pokree promises well; it is to be actively continued on the plan which was introduced into Burmah by Mr. Leeds, and is described in the Burmah Report. The plantation is of mixed teak and toon. Small experimental plantations, "as a data for future operations," have been formed in the Western Dooars and in Upper Assam. Chitagong and the Solmye range of hills in Tipperah are mentioned as suitable for teak plantations. Only a small quantity of timber was extracted from the forests in 1869-70, logs and sleepers together, 4,026 pieces. Paragraphs 36 to 46 explain the different modes under which timber is worked,—

By Permit holders.
Government Agency.
Petty Contractors.
Extra Establishments.

Mr. Leeds repeats his known preference for the first method.

The financial results were:—

	£.		£.
Forest Revenue* - - - - -	4,020	Receipts -	*11,375
From Produce Collected by Revenue Officers -	7,355	Charges -	9,587
	£. 11,375		1,788
The Difference between Assets and Liabilities at the Commencement and			
End of the Year - - - - -			
			1,894
Making the Total Profit - - - £.			
			5,692

The working staff of the conservator was increased from the 1st of January 1870 from two to six assistant conservators. Mr. Leeds laments that he could not obtain one of the young men who had been trained in Europe, and of the want of skilled officers.

The report is reviewed by the Lieutenant Governor of Bengal, and by the Government of India. The small profit is attributed to the weakness of the executive staff for so large an area, and the expectation is expressed that the return of revenue will show a more satisfactory result, since the increase made to the staff, and as the forests gradually come into the hands of the department.

The Government of India point out the necessity, in the interest of the saw mill companies themselves, of the Government protecting its forests, and exercising due control

Appendix, No. 5.

Bengal.

over the forests, by restraining waste of material with respect to the method of obtaining the timber. While they admit that the permit system may at present be the best suited to the strength of the establishment, and the condition of the country, they enjoin great care in the issue of permits, and state it as a "cardinal rule for forest management everywhere, that the actual felling of the trees should rest with the parties who have the control of the forests;" and they consider it "on general principles desirable that no trees should be felled except by the direct agency of the department, after which they might be sold to contractors or permit holders."

In the matter of plantations, they direct attention to the necessity of selecting large blocks of from 3,000 to 5,000 acres as sites, experience having shown that small plantations are unduly expensive, and likely to prove unsuccessful.

The Bengal Government, who had commented at length on many of the points noticed by the Government of India, observed that the revenue from forest produce had increased from 5,336 £. in 1868-69 to 7,355 £. in 1869-70, but that no details are given.

MADRAS.

Madras.

The latest received Annual Report is for 1868-69. The following particulars are taken from the Administration Report for 1869-70.

The year was one of progress in Forest Conservancy. The Government are endeavouring by every means in their power to check the disafforestation, which an increasing population and the spread of agriculture tend to bring about. They are negotiating for the lease of several zemindary forests, in order to institute a system of conservancy in them. In the Government forests care is taken in felling that a sufficient number of trees for reproduction is preserved on every given area, and encouragement is given to the growth of saplings by disencumbering them of long grass and creepers.

Several new plantations have been formed, and existing ones added to.

Twelve thousand sandal wood trees have been planted in the Collegal range, where the plantation now includes 40,000 trees. Upwards of 2,000 acres are occupied with plantations. A large extent of land has been inclosed for railway fuel reserves. These are in the districts of Cuddapah, Salem, North Arcot, and Coimbatore, and now comprise 32½ square miles. But the Madras Railway alone consumes about 50,000 tons of wood yearly, and no special provision has yet been made for the wants of the Great Southern of India. The Government have therefore taken steps to demarcate reserves in the Southern Division.

In point of finance, no year's operations have been so successful since the formation of the department; a net (cash) profit of 20,910 £. having been obtained. This includes 11,835 £. worth of timber felled in former years, but the value of which had not been credited to the department.

The actual figures, as given in the Report on the Budget, were,—

	£.
Receipts - - - - -	49,579
Expenditure - - - - -	28,669
	<hr/>
£.	20,910

Since this digest was prepared, the Madras Report has been received (June 13th). From it have been added to the statements the Financial Statement for the year 1869-70, and an extract showing the amount expended on plantations, and the quantity of timber, &c., drawn from the forests during the year.

BOMBAY.

Bombay.

The Report is divided into two parts, a general report for the whole Presidency (excepting Sindh), and a separate report for the Canara Forests, to which the review of the Government of Bombay is attached.

The general report is by Mr. Shuttleworth, the conservator; the Canara report is by Captain Peyton.

The general report deals with the forests according to the separate collectorates in which they are situated. The most striking feature is the evidence afforded by it of the great resources which the forests of this Presidency, and especially those of North Canara, contain. The receipts were considerably more, by 5,890 £., and the expenditure considerably less, by 4,828 £., than in the previous year; and were also improvements (receipts 28,343 £. more, expenditure 2,458 £. less) upon the amounts estimated in the Budget. The total net revenue far exceeded that of any previous year.

The figures are,—

	£.
Receipts* - - - - -	102,343
Expenditure - - - - -	41,348
	<hr/>
	£. 60,995
Decrease in value of stock - - - - -	3,093
„ „ value of amount of outstandings - - -	83
	<hr/>
	3,176
	<hr/>
Net profit on the year - - - £.	57,819

By

* In addition to this amount, nearly 2,000 £. worth of wood was given away freely in the several collectorates.

Appendix, No. 5.

Bombay.

By far the largest portion of this profit was derived from the Canara Forests, a closer personal examination of which shows them to possess large supplies of most valuable timber. They were inspected this year by Captain Peyton, under whose separate charge, as conservator, they have been lately placed, and by the Inspector General of Forests, Mr. Brandis. Six or eight hours were daily spent in them, examining and making surveys. Captain Peyton bears strong testimony to the value of Mr. Brandis's suggestions, and lays it down as his own principle to utilise trees arrived at their full prime, and all deteriorating stock in the forests, so as to make way for reproduction and the improvement of young trees; and on no account to touch the growing stock of the forests likely to improve. Captain Peyton dwells upon "the vast resources of the Bala Ghauts of Canara with its 1,950 square miles of magnificent forests" and "unhesitatingly" affirms that the yield "can be doubled without the least jeopardising future supplies."

The Revenue Survey has been occupied in separating the cultivated, culturable and grazing tracts from the forests during the year; but in Canara no land is alienated from the forests until it has been examined and reported upon by the Forest Department.

The evil consequences of working by contractors or by licenses, and the benefit, under good superintendence, of working departmentally are shown, both in the general report (paragraph 67 and 68) and in that for Canara (paragraph 97). The saw has taken the place of the axe in felling wherever possible, and the saving caused thereby has been considerable.

Several fine sites, both above and below Ghauts, were fixed upon for plantations, and operations may be extended over several thousand acres lying along the banks of the Kalanuddy, Bairti and Coulghy Rivers. Mr. Barrett's services in regard to teak plantations near Carwar are highly spoken of.

Of the other collectorates only three, the least important as regards forests, Rutuagherry Ahmedabad and Kaira, exhibit an excess of expenditure over revenue. The amount is small, and the circumstances in each account for the fact. Under what is called Mr. Dunlop's proclamation, forest lands were made over to the Inamdars in Rutuagherry. Until they are exhausted there will "probably not be much profit in the collectorate." The effects of denudation are making themselves felt. The people of the country are crying out that the rainfall is yearly less, their creeks are silting up, and shoals and bars forming at the mouths of the navigable rivers. Since the forests were cleared along the Ghauts, nothing checks the rush of water down the hills; it no longer soaks into the ground, but washes the dirt and gravel into the creeks. The rivers are swollen with floods during the rains, but they soon run out, the streams dry out much sooner than they used to do not many years ago, and in the hot weather water is scarce.

Similar testimony is given in respect to Colaba. "The hills in the Konkan are so steep that when once cleared of their tree covering, they become of little use to the cultivator; the rush of water in the rains washes all the soil away until the face of the rock appears; while the trees remain, they prevent this, and annually supply new soil by their decaying leaves and vegetation."

Planting operations were carried on in most of the collectorates. Their importance is urged, and even the expediency of taking up for this purpose land which may be under cultivation.

It is mentioned that in the Sattera Collectorate the cultivators have become so enriched by the growth of cotton, that they are substituting houses of timber for their former mud huts with thatched roofs.

The names of the officers mentioned by Mr. Shuttleworth and Captain Peyton, in the reports are Mr. Paradise (since dead), Mr. Muller, Mr. Wallinger, Mr. Hilliard, Mr. Spence, Mr. Parr, Mr. Morphew, Mr. Williams, Mr. Walsh, Mr. Narayen Bulah and Mr. Barrett for Canara.

SINDH FORESTS.

The Report for 1869-70 is by Mr. Fenner, the forest ranger.

The forests comprise 317,245 acres. The total yield of the year was 1,652,106 cubic feet, being at the rate of 5.20 feet for each average square acre against 4.73 in the previous year, while the general average revenue derived by acre was 12 *a.* 2 *p.* against 11 *a.* 10 *p.* The largest portion of revenue (14,723 *l.*) was derived from firewood. The total quantity sold exceeded the quantity of last year, although it did not realise so much revenue. The consumption of the steamers on the Indus was 550,700 maunds, a less quantity than usual owing to the continuance of an unusually depressed state of trade in Sindh, the steamers being reduced to fortnightly, instead of weekly trips, and being even then not always fully laden. After an inquiry conducted by Sir William Merewether, the selling price has now been reduced experimentally from *Rs.* 18. 8 *a.* to *Rs.* 16 the hundred maunds. A large quantity of dried fallen wood was sold at low rates in the forests; 100,963 maunds of this wood found its way to Bombay by the mouths of the Indus, and caused the increase in the total quantity sold referred to above.

Grazing fees are the next largest item, and then building wood, which brought in 2,496 *l.*, nearly double the amount obtained in the previous year. A timber depôt has been established at Kotree without causing additional expenditure. It did not dispose of much wood in the year. Mr. Fenner observes that the losses and distresses of the agricultural community

Sindh.

* Measurements of trees in the Sherolie Forest above Ghauts, gave from 80 to 84 feet in height from the ground to the intervention of the first branch with clear cylindrical stems, carrying a girth of 9 feet from the ground upwards.

Appendix, No. 5. community through part of the year under review, from a cruel epidemic, and the destruction of their cereal crops by locusts, caused "a deep-seated despondency hardly characteristic of the people of Sindh."

Sindh.

Attention was called by the ranger to the alluvion rules, the subject being of great importance from the rapid changes in the course of the Indus, by which sometimes large masses of forests are carried away.

The financial results show an increase in the receipts over those of the previous year, but a still larger increase in the expenditure, so that the net profit was less by 1,394 £. than in 1868-69. Three items alone, mostly exceptional account for this decrease:—

	£.
A special survey of the forests on both banks - - - - -	888
Increased establishment by addition of two trained men from England	250
And a falling off in grazing fees - - - - -	266

There was also the falling off in firewood before alluded to. Nevertheless, there was a profit of upwards of 9,000 £. on the year.

	£.
Receipts - - - - -	24,088
Expenditure - - - - -	14,876
Net Revenue - - - £.	9,212

The stock in hand was valued at 5,121 £.; but it is not stated whether this exceeds, or falls below, the value of the stock in hand at the beginning of the year. There was also in store at Kotree above 13,000 Babool sleepers not reckoned in the above valuation.

A table is annexed to the report, showing the income and expenditure of the department for the last ten years.

The gross receipts had risen from 12,062 £. to 24,088 £.

The expenditure had risen from 6,122 £. to 14,876 £.

And the net profit from 5,940 £. to 9,212 £.

The total net profit of the ten years being 84,548 £.

Mr. Fenner's assistants during the year were Mr. Hexton and Mr. Pengelly and Mr. Dasai, two of the young men trained in France, from 1867-69. They were well spoken of. Mr. Schlich joined the department only at the end of April.

HYDERABAD ASSIGNED DISTRICTS.

Hyderabad
Assigned Districts.

For the Berar Forests the latest Annual Report received is for 1868-9. The following is, therefore, taken from the Administration Report for these districts for 1869-70.

These forests were this year, for the first time, under a special officer of their own, instead of being a part of the charge of the conservator of the Central Provinces.

The staff of the department is now one deputy conservator, Mr. Strettell, who was brought hither from the Sindh Forests; one assistant conservator, and one European forester. The cost of this establishment is 2,606 £. a year. Every deputy commissioner is also engaged, as far as practicable, in the work of forest conservancy.

The forests are divided into reserved and unreserved, the former managed directly by the department, whilst the unreserved forest wastes are managed by the ordinary district authorities, under the general superintendence of the forest officers.

In the state forests, restoration and development are regarded as of primary importance, and the privileges of the inhabitants of villages lying within their limits are confined to the felling of timber (except teak and sheeshum) for their own wants, free; grazing their cattle under restrictions, and collecting teak leaves and grass for *bonâ fide* domestic purposes.

As a preliminary step to systematic management, the department was divided into two charges, northern, comprising the forests in the Ellichpoor, Oomrawattee, and Akolah Districts, and southern, comprising those in the districts of Booldanah, Bussim and Woon.

It is only in Ellichpoor that reserved, or state forests, have, as yet, been created. These are situated in a rugged tract of country, called the Mailghat. The portion which is within these districts occupies an area of 1,500 square miles. It is inhabited by Ghond and Koorkoo tribes, who gain their chief livelihood by transporting to the plains timber and forest produce, for sale in certain bazaars at the foot of the hills, where the Forest Department collects the duties fixed according to a certain scale. An assistant commissioner stationed in the district has been of use in protecting the interests of these people.

The demarcation of these reserves is only in progress. If the sites selected should prove available, then the entire area of the State forests in this tract alone would amount to 500 square miles, and will embrace the most densely wooded and valuable forest land in the whole range of the Sautpoora hills. The principal timber contained in it, is teak, *tewus*(a), *shushum*(b), bamboos, and *kowah*(c); about 31 square miles has been set apart for specially rigid conservancy; it is patrolled night and day. Every attempt is made to reconcile the wild tribes to the forest rules, by not letting these press too severely upon them, and to bring them to more civilised habits.

c. *Terminalia Ar-*
juna

In

In regard to plantations, nurseries have been formed, a large quantity of seed sown, and seedlings transplanted. Distinct results in the way of experience and observation, of which an account is given, were also obtained. The amount expended was 68 l. 9 s.

The unreserved forests constitute at present the larger sections of the natural wooding of Berar. Their usefulness and importance are expressed in the following observations taken at length from the report. "Their comparatively secondary character in a revenue and economic point of view is more than compensated for by their importance meteorologically, that is in their influence on the rainfall and climate of the province, and by the close connection which there is between their condition and the supply of fuel, and of wood for domestic purposes. It seems probable that Berar, like many other parts of the world which are now comparatively bare, was at one time covered, at least in many places, with masses of luxuriant forests, while it is also certain that from whatever cause, the rainfall is not at the present day so copious as it was a few generations ago. All these considerations point to the necessity of forest conservancy being bestowed as carefully on the humbler trees of the coppice whose leaves act upon the atmosphere, and of whose wood may be made the simpler implements of agriculture, as upon the giants of the forest, whose trunks yield timber such as perhaps the shipbuilder in remote dockyards can turn to account; as a matter of fact an increasing scarcity of wood for domestic purposes is now manifesting itself in several parts of the assigned districts, so much so, that the fields are in some instances robbed of their natural manure, through the droppings of the cattle being collected by the poorer classes as fuel, while it is said to be not uncommon to see men, women, and children, grubbing up the jawaree roots for the same purpose."

Taking one district with another, Mr. Strettell was able to report a fair amount of progress in extending and caring for the unreserved forests, for the developement of which much was done during the year. Coppices, or buns of the babool tree (especially the indigenous tree of Berar) were marked off, and attempts were made to introduce a system of coppice rotation in the hills.

Teak cultivation was carried on with decided success in the Oomrawuttee district.

A great deal remains to be done, but the steps taken have, it is hoped, laid good foundations for future progress.

But little timber was felled or sold from the reserved forests, the demand of the people being supplied from the district forests. The principal items of receipt were permit fees (977 l.) and grazing dues (784 l.).

The financial results of reserved and unreserved forests were,—

MYSORE FORESTS—Report for 1869–70.

The Report is by Lieutenant Van Someren; it is reviewed by the Chief Commissioner, Colonel Meade, and the Government have issued their observations and instructions upon it. It begins with an introductory account, giving statistics, with a general description of the country. It is sufficient to state that the total area is estimated at 28,449 square miles, and the population at 4,000,000, or an average of 140 to the square mile; but there is great inequality of distribution, one district showing 357 to the square mile, another only 38.

It is popularly divided into the Hill Country, Malnad; and the Plain Country, Byhe-Simé.

The 2,870 square miles of forests are roughly divided into State and District forests, the former numbering 370, and of these 45 being evergreen, and 325 deciduous.

The number of the district forests is put down at 2,000 deciduous, and 500 evergreen; but these calculations are only approximate.

The province contains three distinct classes of forest belts of very unequal width, running north and south. The conservator classes them into "Evergreen," "Mixed," and "Dry."

The first belt comprises the country in the western Ghauts and immediately below them, and extends from the northern boundary of Coorg to the north of the Sigara Talook. It is

Appendix, No. 5.

Hyderabad
Assigned Districts.

Mysore.

Appendix, No. 5. nowhere more than from 12 to 14 miles, and, in places, not more than six in width. "Many of the hills are covered to their summits with heavy forests, while the valleys and ravines produce trees which can scarcely be rivalled in India, so luxuriant is their growth, so vast their height, so great their size. In some parts the under-growth is dense, elsewhere the forest is open, and on all sides trees with clear stems to the first branch of from 80 to 100 feet meet the eye." Seven kinds of valuable trees are specified as growing in these forests, but the wealth of the timber in these forests is almost entirely unproductive, from the difficult nature of the country, although it is pierced by four roads. On the lower western slopes a few trees are occasionally sold standing by the Forest Department.

Mysore.

The Mixed Belt extends the whole length of the province from near Bundipoora in South Ashtagram to the extreme north of the Soraba Talook in Nagar. It varies in width at different points from 10 to 40 or 45 miles. It includes most of the timber-producing State forests, and much sandal-wood, the Kans* of Soraba and other portions of Nagar, the areca-nut, and Cardamom Gardens, the coffee plantations of Nagar and Manjarabad, and the rich rice flats of Sagara, Nagar Kaveledurga, Chikkanagalwan and Heggadadevanakote. There is no clear line of definition between this and the less useful strip to the west; and for the eastern limit a line may be drawn almost from Amravati in the north, bending first to the south-east between Shikaripura and Honnali, and thence, after an easterly and a southerly course, to Wastara, and so on through Palyem, and then to the south-east through Antrasante to Bundapoora. Besides the trees proper to the evergreen forests already mentioned, 30 other kinds are enumerated as the most important trees of this belt. The best teak localities are also pointed out, and other useful and popular woods are named.

The Dry Belt lies to the east, and includes the far larger portion of the whole province. The tree vegetation is inferior, especially near the Babá Budan hills, which from their elevation arrest much of the rain, which would otherwise pass to the east and north-east. The belt possesses jungle tracts, which are very valuable, and the conservator observes that "the conservation and extension of these tracts is perhaps our most important duty in this dry land." This tract also contains many hundreds of planted groves, natural groves of acacias (chiefly in the Kolar district) and numerous cocoa and areca nut gardens. The sago palm is common in gardens in the mixed belt, and also grown in the Arca nut gardens. The date palm also grows in both. The teak, and many of the other trees common to this with the other belts, are of stunted size. The names of 17† additional trees are given as the most important found in this tract, besides shrubs and bushes. The conservator gives an account of the divisions of Nagar, Ashtagram and Nundidroog, into which the province is partitioned, and of the districts and chief towns in them. He states the arrangements made to provide for the wants of the population. No legal rights ever existed in the State forests of Mysore, and no hardship has been caused to the population. In some cases, where people have been excluded from small portions of land cultivated in the middle of the forests, they have been "liberally compensated." The list of State forests is not yet complete, "more land will, with great advantage to the public and to Government, be added to it by degrees."

The teak plantations are being made, but as yet they have not proved very successful, although St. Van Someren does not think that all attempts at planting should be abandoned, he is against extensive plantations planted out from nurseries, and would rely chiefly upon re-producing the better class of timber in the natural forests. He holds it to be proved "that Mysore teak is tougher and closer grained and will bear a greater breaking weight than Burmah teak, but it is very much smaller and * * * of slower growth." "On the other hand Mysore produces several good timbers which are but little inferior to teak, and in which we cannot be undersold." Burmah teak is largely used in the Madras districts.

Only in the Nundidroog division have any fuel reserves been yet made, but the question of fuel is becoming of great importance, especially in the neighbourhood of Bangalore, and to provide for the wants of the railway. The Government of India has directed that the measures with this object should be pushed on with all diligence. Wood is imported from Madras and Coorg.

Sandal wood is sown in inclosed reserves; it seems likely to succeed by broad-cast sowings on prepared ground; but attempts to form nurseries by transplanting have failed. The ryots dislike having the trees in their fields, as it is in all cases strictly reserved. Paragraphs 56 to 61 give an account of this valuable wood from which the following facts are taken: It grows largest and highest with a moderately heavy rain-fall, but the perfume is not so strong in arid localities where the soil is red and stony. The heartwood and roots are the portions which are most highly scented and rich in oil; the older the tree the nearer the heartwood comes to the surface. The tree attains maturity in about 25 years; and its girth in that state varies from 18 to 36 or 40 inches. The best parts are used for ornamental articles. The roots and chips, which are richest in oils, go to the still, and are the basis of many scents. It is burnt by rich natives at the burial of deceased relations. It is sold by weight, and not by measurement, in lots of 10 kandis or 2½ tons each. The province is divided into 24 sandal districts under managers and their assistants, who mark and collect the wood. By far the greater portion of the wood yearly sold in Mysore goes to Bombay.

Forest rules have been drawn up and acted upon. The services of Lieut. Van Someren, of his assistant, Mr. Dobbs, and of Mr. Ludlow, are commended.

The

* Tracts of forest land originally annexed to wurgs or farms for the sake of leaves for manure, firewood, &c., but of late irregularly cultivated with coffee.

† Making 56 specified in the three belts.

The financial results are pronounced by the Government of India to be not so favourable as they have been during the last two years; but, not unsatisfactory. Appendix, No. 6.

Receipts -	-	-	-	-	-	-	-	£.	29,521
Expenditure -	-	-	-	-	-	-	-		10,425
									19,096
Excess value of Stock -									603
TOTAL PROFIT -									£. 19,699

Mysore.

The Government, however, point out that there is some discrepancy as to the value of the stock.

The quantity felled in the three divisions in the year was :—

Teak -	-	-	-	-	-	-	16,694 cubic feet.
Jungle wood -	-	-	-	-	-	-	33,028 "
TOTAL -							£. 50,622 "

besides 98 teak poles and 515 branch pieces.

2,144 kandis (560 lbs.) of sandal wood were collected during the year.

There were 9,417 logs and poles of timber in store at the end of the year, and 1,245 kandis of sandal wood, estimated to be worth 16,3837.

The sales of minor forest products are small; but those by forest officers are distinct from those made by the district authorities, who lease out the minor products. This year they were sold to contractors.

TOTAL - - -	34,348	2	3	1,392	3	3

TOTAL on Planting - - - Rs. 35,740. 5. 6.

186. *Amount of Timber, &c., Firewood, Bamboos, and Charcoal taken from the Forests during the Year.*—“Omitting the district of Guersur, the following are tables showing the amount of timber, firewood, bamboos, and charcoal taken out of this forest during the year. It will be seen that 9,30,010½ cubic feet have been removed from the forests during the year.

“Omitting the free felling of firewood in Salem, Cuddapah, and North Arcot, as well as bamboos in Salem, of which no record has been kept, 57,434 tons of firewood have been removed, and 33,213½ bandy loads of bamboos. In addition to the above, 16,504½ maunds of sandal wood, 1,161,799 lbs of red sanders, and 1,588 telegraph poles, have been cut during the year.”

AMOUNT of Timber, Firewood, Bamboos and Charcoal taken out of the Forest during the Year.

APPENDIX No. 2.

TABULAR STATEMENTS showing the Amounts realised by, and paid on Account of, different Classes of **TIMBER** received on Government Account in **BRITISH BURMAH**, from 1864-5 to 1869-70; also,

STATEMENTS of the **RECEIPTS** of the Forest Department in the several Administrations for the Year 1868-9, showing how the Revenue is derived from all Sources, and distinguishing, in as far as is possible, the Timber which has been cut down by Individuals under Licenses, and showing how much has been realised by the Timber and how much by the Licenses.

"	-	-	64,460	42,177.2	7,84,138 15 -	12 2 -	32.7	18 9 -		

* The average cubical contents appears less this year, owing to the proportion of sleepers being much larger in this than previous seasons. For instance, in 1863-64, the number of logs was 11,980, of which 1,298 were sleepers; this year out of 9,136 logs 2,093 are sleepers. If sleepers were struck out, the average would be 44.9.

Public Works Department Proceedings, September 1869.

REVENUE—FORESTS.

CAPTAIN SEATON'S REPORT ON THE TEAK PLANTATIONS OF NELLUMBOOR, IN MADRAS.

(Proceedings, July 1867, Nos. 14-18.)

No. 1122—11 F, dated 25 January 1869.

No. 23.—From *W. B. Macrone*, Esq., Assistant Secretary to the Chief Commissioner of British Burmah, in the Public Works Department, to Secretary to the Government of India, Public Works Department.

I AM directed by the Chief Commissioner, British Burmah, to transmit 30 copies of Captain Seaton's Report on the teak plantations at Nellamboor, in the Madras Presidency. The deputation of an officer for the purpose of inspecting these plantations was originally suggested by Dr. Brandis, and approved by the Government of India in the letter from the Public Works Department, No. 138 F, dated 6th April 1868.

2. The Chief Commissioner considers that Captain Seaton has submitted a very clear and useful report on these plantations, and he is fully satisfied that plantation work in this Province will benefit accordingly. The Government of India are aware that the policy of the forest administration of the Chief Commissioner is directed towards a vigorous expansion of the plantation system. He is quite satisfied that, judging from the results of the Madras plantations, the true method of reproducing teak timber lies in the development of plantations which can be supervised with far greater ease and economy than natural forests spread over a great area of country, sparse in population, and much of it difficult of access.

No. 71 A, dated 9 December 1868.

No. 24.—From Captain *W. J. Seaton*, Conservator of Forests, British Burmah, to Secretary to the Chief Commissioner of British Burmah, in the Public Works Department.

For the information of the Chief Commissioner, I have the honour to submit the following report of the visit paid by me to the teak plantations at Nellamboor, in the Madras Presidency, in accordance with your Proceeding No. 23, dated 12th May 1868.

2. From Ootacamund, which I left on the 26th September, I proceeded to Neddavattum, distant 18 miles, thence down the Neddavattum Ghât, a descent of 3,000 feet, to Cuddaloor in the Wynnad, distant five miles. From thence my route was eight miles westward over the Wynnad plateau to the head of the Carcoor Ghât, down which I descended 3,000 feet by an excellent cart-road into the level country of the Malabar district, and on to Nellamboor, distant, in all, 22 miles from the head of the Ghât.

3. I would here add my testimony in support of the far-famed reputation which the forests of the Western Ghâts have acquired. A few hundred feet below the head of the Carcoor Ghât the road enters dense evergreen forest of huge trees with clear stems of 100 to 120 feet to the first branch, with an almost impenetrable undergrowth of ferns and evergreen shrubs.

For luxuriance of growth, size, and height of stems, it would be difficult to find anything to rival these trees, except in some of the evergreen forests of the Tenasserim division of this Province, mentioned in the Administration Report on the Attaran Forests for 1858, page 54, para. 15.

The principal species on the Carcoor Ghât are the wild Jack or *Artocarpus hirsuta*; the poon spar or *Calophyllum elatum*; naga, *Mesua*; pala, *Bassia elliptica*, and the pink cedar, *Acrocarpus fraxinifolius*, as well as some *Dipterocarpeæ*, all of which are said to yield valuable timber, and will doubtless be removed now that the road renders the locality so accessible.

The lower part of the Ghât is occupied by deciduous forests and belts of the thorny bamboo, *Bambusa arundinacea*, with a sprinkling of teak of very fair growth, of 2nd, 3rd, and 4th classes; some vengay, *Pterocarpus marsupium*; *Inga Xylocarpa*; *Terminalia tomentosa*, and *Dalbergia latifolia*, or the black-wood tree of India.

4. I reached Nellamboor on the 28th September, and with the kind aid of Mr. Ferguson, the Assistant Conservator in charge, was able to examine almost every part of the plantation by the 5th October.

Appendix No. 6. To convey a comprehensive idea of these plantations, a description of them must of necessity enter into details, especially if it is to prove in any degree interesting and instructive to forest officers in Burmah.

5. These details will be treated separately, under the following heads :—

- I.—History.
- II.—Situation and Exposure.
- III.—Area.
- IV.—Soil.
- V.—Accessibility and Facilities for Transport of Timber.
- VI.—System of Cultivation.
- VII.—Condition of Plantations, and Results of Measurements.
- VIII.—Expenditure.
- IX.—Revenue, Present and Prospective.
- X.—Comparison with British Burmah Plantations.

I. History.—In 1844, several large blocks of land, covered with jungle, and estimated to embrace an area of 20,000 acres, were obtained by the Madras Government on perpetual lease from the Rajah of Nellambool, the Zamorin Rajah of Calicut, and the Hindoo temple of Triculoor Devassum, on condition of a stump fee of eight annas being paid by Government for every planted tree on arrival at maturity.

The first plantation was commenced (in 1844) by Mr. Conolly, the Collector of Malabar, who, in 1855, met his death at the hands of Moplah assassins, and in whose memory these plantations have been officially designated the “Conolly” plantations.

The area annually planted was at first 100 acres, but this was gradually reduced to about 50 acres, until 1863, when the plantations were placed in charge of the present incumbent, Mr. Ferguson, a trained forester from Scotland, under whose able management the area planted annually was increased to 100 acres.

II. Situation and Exposure.—The “Conolly” plantations are situated on undulating ground along the banks of the Beypoor River, and of its tributaries the Shalaya, Sheriapoya, and Sharpoya, at the points of confluence above and below the village of Nellambool, which is about 10 miles from the foot of the Western Ghâts, and 40 miles from Calicut on the coast.

Towards the north and east the Nellambool District is sheltered by the Western Ghâts and Neilgherry Hills, which on this side present, in some places, almost precipitous declivities of 6,000 feet, while on the north-west side it is protected by the “Vellay Mullay” Range, a spur of the Western Ghâts running to the south-west and west, and terminating near the coast.

Being thus open to the south and so near the sea, the climate of Nellambool is particularly moist during the monsoon, the rainfall being 150 inches and above, while, owing to its sheltered position with regard to northerly and easterly winds, the heat at nearly all seasons of the year is excessive. It is, in short, a “forcing climate” as regards vegetation, and so much so that Nellambool is compared in that respect by some to a huge conservatory.

III. Area.—The area planted up to date with teak is about 2,000 acres. The plantations extend in narrow belts a distance in all of six miles, and vary in width from quarter mile to a mile; having a stream on one side, and either paddy fields or low jungle on the other.

IV. Soil.—Near the banks of the streams the soil is a rich alluvial deposit of great depth, with, in some places, a large admixture of sand. A few hundred feet from the banks the soil changes to sand and disintegrated laterite resting upon a substratum of hard laterite, which crops out above the surface wherever the ground is a little elevated.

V. Accessibility and Facilities for Transport of Timber.—From Nellambool down to the coast, the Beypoor River is navigable all the year round for boats of good size. Its tributaries likewise are large streams with flowing water in them throughout the year. From their proximity to such waterways, the greatest facilities exist for the removal of the timber, which is taken to Calicut for sale.

VI. System of Cultivation—Propagating and Planting.—In December, at the close of the north-east monsoon, the jungle on the site selected is felled and prepared for burning, which usually takes place at the very close of the dry season.

In April, before the setting in of the rains, nurseries are formed in a part where water can conveniently be had.

The seed, after being steeped 48 hours in cold water, is sown on raised beds of fine mould, freed from grass, roots, &c., perfectly level, and surrounded with a margin four inches high to help to retain the water when poured on. These beds are then covered with straw to prevent a too rapid evaporation, and are kept moist by constant watering until the seed germinates, and the young plants break the ground, which is generally within a lapse of from 12 to 20 days.

As soon as the rains commence, the plants are put out in line six feet apart, and at six feet distances within the lines, the plants in every alternate row being opposite the vacancies in

in rows next to them. They are placed in pits a foot square and a foot deep, filled with good surface mould. Nothing more is done besides hoeing the ground around the plants and weeding them from time to time, as may be necessary. Appendix No. 6.

A plantation is generally four years old before it is able to keep down grass and other jungle by its shade.

Pruning.—In the second year and subsequently, the plants are pruned of their lower branches; in this operation the foreshortening system is observed, in lieu of close pruning.

Thinning.—In the fifth year, thinnings take place of all the weaker and overtopped trees, which can be removed without affecting the cover, which should be such that the primaries can develop themselves while the extremities of the boughs are interlaced. Thinnings are repeated every five years until the plantation attains the age of 20 years, when once in 10 years is deemed sufficient.

Fire tracing.—A broad belt, several yards wide, is cleared around the boundaries of the plantations, about the middle of the dry season, and peons accompanied by coolies are sent to examine this cleared track every second or third day to see that no further accumulation of leaves and inflammable matter takes place.

VII. Condition of Plantations, and Results of Measurements.—At the first glance at the older plantation, from 12 to 24 years of age, one cannot but be struck with the magnificent growth of the trees. The largest are from 4 ft. 7 in. to 5 feet in girth, with straight cylindrical stems 60 to 70 feet in height. These are found more or less on alluvial soil close to the streams; elsewhere, the growth of the trees, although in many parts excellent, does not appear to have been so rapid, but this is only what might have been expected on indifferent soil with laterite at no great depth below.

The presence of so many trees of smaller girth will account for the average size of the trees in the oldest plantation not exceeding 2 ft. 5 in., as will be seen from the results of the measurements detailed below.

Every part of the plantations bore evidence of the good resulting from a careful pruning of the side branches, some of which appeared to have been taken off at a height even of 20 feet.

In parts, thinnings seem to have been carried on almost too freely, and this, perhaps, may account for the clearing away of the underwood being found necessary in some of the older plantations before pruning operations could be carried on. A few trees bent over with the wind were met with; probably the per-centage of trees thus affected is small, owing to the sheltered position of Nellamboor, and this might justify the removal of more trees in the thinnings than is usually deemed advisable; the advantage accruing from it being that the stems develop themselves much more rapidly.

PLANTATION OF 1844. Soil.—Alluvial soil of good depth near the stream; elsewhere, a ferruginous loam mixed with decomposed laterite.

Growth.—Excellent.

Cover.—Complete.

Average number of trees per acre	-	-	-	-	-	195
„ girth at six feet from the ground, calculated on measurements of 114 trees on 58 of an acre	-	-	-	-	2 ft. 5 in.	
Maximum girth	-	-	-	-	4 ft. 8 in.	
Minimum	-	-	-	-	1 ft. 4 in.	
Height of larger trees in clear stems	-	-	-	-	65 feet.	

PLANTATION OF 1849. Soil.—Dark alluvial, changing into ferruginous loam, and disintegrated laterite on the higher parts.

Growth.—Good on the laterite soil: two forked trees were bent by the wind. Height of trees also is considerably less than on the alluvial soil.

Cover.—Incomplete; more or less open.

Average number of trees per acre	-	-	-	-	-	297
„ girth calculated on measurement of 125 trees standing on 42 of an acre	-	-	-	-	2 ft. 1 in.	
Maximum girth	-	-	-	-	3 ft. 5 in.	
Minimum	-	-	-	-	1 ft. 4 in.	
Height of stems	-	-	-	-	50 to 57 feet.	

PLANTATION OF 1854. Soil.—Alluvial, with a great admixture of sand.

Growth.—Excellent; two exceptionally large trees were met with, 3 ft. 3 in. and 3 ft. 5 in. girth.

Cover.—Complete, underwood springing up.

Average number of trees per acre	-	-	-	-	-	338
„ girth, calculated on measurement of 88 trees standing on 26 of an acre	-	-	-	-	2 ft. 2 in.	
Maximum girth	-	-	-	-	2 ft. 5 in.	
Minimum	-	-	-	-	0 ft. 10 in.	
Height in clear stem	-	-	-	-	51 feet.	

Appendix No. 6.

Measurements were taken in another part of this plantation of 27 trees standing upon .60 of an acre, on almost pure laterite, with hard rock cropping out of the surface here and there.

The results were—

Average girth	-	-	-	-	-	-	-	-	1 ft. 5 in.
Maximum „	-	-	-	-	-	-	-	-	1 ft. 10 in.
Minimum „	-	-	-	-	-	-	-	-	1 ft. 1 in.
Height of one of the largest trees	-	-	-	-	-	-	-	-	35 feet.

Cover.—Barely complete, leaves yellowish, sparse, and a good deal eaten by insects.

PLANTATION OF 1856. Soil.—Alluvial, with a mixture of decomposed laterite on the higher parts.

Growth.—Good.

Cover.—Complete.

Average number of trees per acre	-	-	-	-	-	-	-	-	476
„ girth, calculated on measurement of 119 trees on .25 of an acre	-	-	-	-	-	-	-	-	1 ft. 4 in.
Maximum girth	-	-	-	-	-	-	-	-	2 ft. 7 in.
Minimum „	-	-	-	-	-	-	-	-	0 ft. 10 in.
Height in clear stems	-	-	-	-	-	-	-	-	45 feet.

PLANTATION OF 1859. Soil.—Ferruginous loam, which is mixed with decomposed laterite on the more elevated parts.

Growth.—Good on the loamy soil, elsewhere indifferent.

Cover.—Complete in parts.

Average number of trees per acre	-	-	-	-	-	-	-	-	811

VIII. *Expenditure.*—The expenditure on all the plantations amounts annually to about 7,000 rupees, of which sum 3,000 rupees, or 30 per acre, is expended solely on the clearing, planting, hoeing, and the weeding operations of the additional 100 acres added annually to the plantation.

The establishment maintained at Nellamboor consists of—

1 Overseer	} on 236 rupees per mensem.
2 Writers	
3 Duffadars	
13 Peons	

At this establishment is employed in other operations connected with the working of the forests of the Nellamboor Range, half of this sum, or nearly 120 rupees per mensem, can be fairly charged against the plantations, which is equal to 1,440 rupees in the year.

The cost of the thinnings, which amounts to 20,000 saplings annually, is as follows:—

	Rs.
Marking and felling, at 8 annas per 100	100
Collection at the bank of the stream, at 40 rupees per 1,000	800
Rafting to Calicut, at 60 rupees per 1,000	1,200
	<hr/> 2,100

The remainder of the expenditure is upon pruning operations and the clearing of under-wood connected with it.

IX. Present and prospective Revenue.—The annual yield of these plantations is about 20,000 saplings, the produce of thinning operations.

The saplings are thus classed for sale:—

Under 6 inches diameter, 1st class.			
5	2nd	4	3rd
4	3rd	3	4th
3	4th		

They realize from 5 annas to 5 rupees each at Calicut, where they appear to find ready sale for house-building purposes, and for conversion into masts and yards of coasting vessels. On an average, the saplings are said to realise 8 annas each all round, or 10,000 rupees annually.

This considerably exceeds the expenditure, estimated at about 7,000 rupees, and shows the present financial results of the plantations to be highly satisfactory.

The future prospects of the plantations are yet more promising, and bid fair to prove a source of great wealth to Government.

The older parts of the plantations, now 24 years of age, will probably reach maturity within a period of 60 years.

At the close of the above term, it may be confidently expected that the plantation will be in a position to yield mature timber on 100 acres annually.

If 50 first-class trees are taken as the average yield per acre, and each of these trees estimated to contain about 50 cubic feet of timber, it may safely be assumed that a net revenue will accrue of about 40 rupees per tree, or two lakhs annually. This is based on the supposition that the Nellamboor teak will continue to realise the same high prices as is the case at present, viz., from 1 rupee to 1-8 and 2 rupees per cubic foot.

X. Comparison of Results with those of the Teak Plantations of British Burmah.—I now only remains for me to compare the "Conolly" plantations with those of this province, and to state whether it will not be advantageous to introduce alterations in our system of cultivation and in selection of future sites for plantations.

A short review of the British Burmah plantations will not be out of place here.

The experimental cultivation of teak was commenced in 1856.

The area under teak cultivation is at present about 765 acres, viz.:—

	Acres.
Rangoon Division	45
Tharrawaddie "	351
Prome "	67
Sittang "	285
Salween "	17
	<hr/> 765

Many of these can only rank as experimental plantations, and consist of small detached blocks, the largest at present not more than 185 acres in extent. Many have been made on soil most unsuitable for the growth of teak. The formation of one plantation was attempted in the Tharrawaddie on ground so badly drained, that only a few of the trees survived; more recently a similar error was committed in the Sittang Division by the selection of localities where the soil was nothing more than a superficial layer of sand and dis-integrated laterite resting upon pure laterite.

In the Prome plantation, commenced in 1856, the actual area of suitable soil is limited to the slopes and level ground at the base of the most westward line of low hills, the soil on most of the hills being dry, hard, and capable of producing only timber of inferior quality.

Appendix No. 6.

Wherever good alluvial soil was selected, such as in the Thinganneenoung on the Attaran, the lower parts of the Prome plantation, and a part of the Myodwin plantation, the growth of the trees has been all that could be desired, and leaves no doubt as to the artificial cultivation of the tree being attended with results equal to those obtained in the Nellamboor plantation.

An instance of this is the Myolay Choung plantation of 1863 at Myodwin. The average girth, taken from 90 trees in January 1868, was found to be 12·2 inches, which shows the growth to be equal in rapidity to that of the (1862) plantation in Nellamboor, the average girth of which was found to be 12 inches.

The average girth of the trees in the oldest part of the Prome plantation planted in 1856 is 1 foot 8 inches, while that of the (1856) plantation at Nellamboor has been found to be 1 foot 4 inches; but this difference may be accounted for by the measurement in the Prome plantation having included only the trees on the level ground, where the soil is richest.

It will thus be seen that there is every prospect of the teak plantations of this Province rivalling those of the Madras Presidency, if due attention be paid to the question of soil and drainage.

Accessibility and cheap means of transport are also requisitions in the selection of sites for plantations.

The Nellamboor plantations, as will have been seen by the description given above, are in this respect most favourably situated.

Burmah, however, is well intersected by large streams, and though it may not be possible to obtain good sites for plantations within a distance of 40 miles from the seaboard, the rainfall in the lower part of the Province is so abundant, that streams of much smaller capacity than the Beypoor River can be used in the rains for the transport of timber.

In the matter of cultivation every effort has been made to reduce the expenditure as much as possible, and with very good results in the Sittang division, but in this there is the danger of overlooking details and risking the successful issue of the work as has already been observed by my predecessor in para. 50 of the Administration Report for 1865-66.

The contrast between the younger plantation at Nellamboor and those recently commenced in the Sittang and Tharrawaddie Divisions fully confirm this.

In the former it is difficult to find any failures among the plants, while in the Sittang plantations, examined last January, from 18 to 32 per cent. of the plants were found to have failed, and in the Tharrawaddie Division upwards of 35 per cent.

Doubtless the blanks can be filled up in the course of a season or two, but not without a good deal of labour. In such plantations also, grass and other jungle spring up in great luxuriance, and increase the risk of injury by fire, as well as add considerably to the expenditure in clearing.

The cause of these failures is, in most cases, the system in vogue in this Province of sowing the seed in lines at certain distances apart, and of having only a small nursery to fill up the spots when the seed happens to fail.

The first objection to this system is, that thoroughly good and reliable seed is most difficult to obtain, and thus failures will always occur. In the second place, as the sowing does not take place till the rains fairly set in, it may be assumed that the failures are not discovered till a month or more is passed. If the weather is not propitious for transplanting, the removal of the plants from the nursery is delayed accordingly, and it generally happens that the blanks are not fairly re-stocked with plants until two months of the rainy season have gone by. These transplants, as a rule, turn out weak, and do not become well established in the remaining three months of the rainy season. They are consequently unfit to stand the continued drought of the dry season, and a large per-centage of them as a matter of course succumb to the heat.

In the Nellamboor plantation, the system is different; the seed being sown and the young plants raised in nurseries a month before the rains set in, when transplanted into the main plantation, they have the whole of the rainy season before them, and are consequently so vigorous and well established at its close, as to be little affected by the dry season.

The adoption of this system will do away with the failures in our plantations, and, under proper management, ought not materially to add to the cost of plantations.

The advantage accruing from the plants growing up in one compact mass of uniform size will be, the more even and regular growth of the trees, and the development of long stems.

If, in addition to this, pruning operations are carried on with that care and regularity which have been bestowed on those of the Nellamboor plantation by Mr. Ferguson, I have no doubt that all our plantations will have that regularity in growth, height, and symmetry of stems which is the main characteristic of the "Conolly" plantations.

6. In concluding this report, I would take this opportunity of recording my indebtedness to Major Beddome, the Conservator of Forests, who accompanied me to the Nellamboor plantation from Ootacamund, and to Mr. Ferguson, from whom I received every assistance while examining these plantations, which reflect so highly on his able management and practical knowledge as a forester.

7. It may not be out of place here to add that on my return to the Wynaad *en route* to Ootacamund, I made a *détour* to the northward as far as the Mudamullay forest range. A small teak plantation was commenced five years ago at Mudamullay, but it is not in a very promising condition; the trees are stunted, and the blanks numerous. An earth cutting

cutting near the plantation fully explained these unsatisfactory results; the soil, although a light vegetable mould, did not extend to a greater depth than three feet, below which there was a hard stratum of laterite.

Appendix No. 6.

8. To the west of Mudamullay I visited the Benni forest, situated on some hills, drained by feeders of the Cubbani river. Here, as well as at Mudamullay, the teak, though abundant and of good girth, has a stunted appearance, the stems being short compared with the teak found in these Provinces. In some parts of the Benni forest there is very fair timber; the stems of some of the trees were upwards of 60 feet in height, and doubtless in the more sheltered localities such timber is to be found in considerable profusion.

CIRCULAR, No. 15 F., dated 13 September 1869.

No. 25.—*Resolution*, by the Government of India, Public Works Department.

Public Works Department, Circular, No. 17 F., of 15th July 1867.

Read also :—

A letter from the Chief Commissioner of British Burmah, No. 1,122—11 F., dated 25th January 1869, and enclosure.

OBSERVATIONS.—The Governor General in Council has read with great interest a report submitted by Captain Seaton, Conservator of Forests in British Burmah, on the Nellumboor teak plantations in Malabar.

2. This report gives a clear and business-like account of the present state and of the past history of these excellent plantations, which were first established in 1844 by the late Mr. Conolly, Collector of Malabar, and which are now reported to cover an area of more than three square miles.

3. The reports of all officers who have visited these plantations agree that the selection of the land was excellent as regards climate, soil, the facility for the export of timber, and other circumstances.

4. The most remarkable feature, however, of these plantations is, that apparently they have been established at a very small cost to the State, and, from the reports received, it would appear that at this time they are self-supporting.

5. The following figures have been taken from the proceedings of the Madras Government of November 1867, and the Madras Forest Report for 1867-68 :—

	Receipts.	Charges.
	<i>Rs.</i>	<i>Rs.</i>
1857-58 to 1859-60 - - - -	8,787	Not given.
1860-61 and 1861-62 - - - -	5,423	6,886
1862-63 to 1866-67 - - - -	93,199	67,026
In 1867-68 - - - - -	3,007	14,286
TOTAL from 1860-61 to 1867-68 - <i>Rs.</i>	1,01,710	87,098

Thus during the last eight years, for which complete figures are available, there has been an average annual outlay of 11,000 rupees, against average receipts of 12,500 rupees per annum.

6. It is understood that latterly upwards of 100 acres have been planted annually: the average cost per acre, therefore, may be assumed as 110 rupees.

7. The nature of these receipts is stated in the Proceedings of the Madras Government to have been as follows, for the five years from 1862-63 to 1866-67 :—

	<i>Rs.</i>
Sale of thinnings of plantations -	53,737
Sale of natural timber and bamboos -	39,462
Total - - - <i>Rs.</i>	93,199

Appendix No. 6.

8. Under such favourable circumstances, it would appear to his Excellency in Council that there is no limit to the extension of these plantations, except the amount of land available, and the supply of labour; and these excellent results, which are the best proof of the care bestowed by the Madras Government upon this important undertaking, appear to justify the extension of these plantations on a very much larger scale than has hitherto been attempted.

9. At the present rate of progress, Captain Seaton estimates that at the end of 80 years from the commencement of operations, upwards of 8,000 acres, or $12\frac{1}{2}$ square miles, will have been planted, which, at the present rate of expenditure, will entail a total outlay of 8,80,000 rupees. But unless the demand for timber and poles should decrease, or other unfavourable circumstances should arise, the whole of this outlay will be covered by the receipts from thinnings and other sources. Thus in Nellumboor the revenue, which at the end of 80 years will be derived by cutting down, say, 100 acres of mature forest annually, will be a pure gain. Captain Seaton estimates the value of an acre covered with pure teak forest, 80 years old, in this locality at 2,000 rupees. At this rate the Nellumboor teak plantations will, 60 years hence, yield an annual revenue of 2,00,000 rupees, provided the whole area, 8,000 acres, shall have been planted by that time. And if present anticipations are realised, this revenue, which amounts to 25 rupees per acre on the total area, will be secured without the outlay of any considerable capital. And even if this estimate should not be fully realised, it appears to his Excellency in Council that the results already achieved are most encouraging, not only as regards Malabar, but also as regards other localities where climate and other circumstances for the growth of teak are equally favourable.

PAPERS handed in by Sir *H. Bartle Edward Frere*, K.C.B., 23 May 1871.

Appendix, No. 8.

ACT No. XIII. of 1871.

Passed by the Governor General of India in Council.—Received the assent of the Governor General on the 31st March 1871.

AN ACT to Consolidate and Amend the Law relating to CUSTOMS DUTIES.

WHEREAS it is expedient to consolidate and amend the law relating to the duties of Customs on goods imported and exported by sea, it is hereby enacted as follows:—

1. This Act may be called “The Indian Tariff Act, 1871.”
It extends to the whole of British India, except Aden; and it shall come into force on the passing thereof.
2. There shall be levied and collected, in every port to which this Act applies, the duties specified in Schedules A. and B. hereto annexed.
3. Goods not prohibited to be imported into or used in British India, composed of any article liable to duty as a part or ingredient thereof, shall be chargeable with the full duty payable on such article, or if composed of more than one article liable to duty, then with the full duty payable on the article charged with the highest rate of duty.
4. Nothing herein contained affects Act No. XX. of 1867, or authorises,—
1. The levy of import duties on articles (other than salt, opium, and spirits) imported into one port in British India from another;
 2. The levy of export duties on articles exported from one port in British India to another;
 3. The levy of export duties on articles exported by sea to any place other than a foreign port in India, when such articles have been imported by sea into British India.
- And, notwithstanding anything herein contained, no opium shall be exported from British India, unless it be covered by a pass granted by an officer appointed in this behalf by the local government.
5. Section 27 of the Consolidated Customs Act shall be construed as if, for the words “for which a specific value has not been fixed by the local Government with the sanction of the Governor General of India in Council,” the following words were substituted; that is to say, “for which a specific value is not fixed by the Indian Tariff Act, 1871;” but, save as aforesaid, nothing herein contained shall be construed to affect the provisions of the Consolidated Customs Act.
6. The Governor General in Council may from time to time, by notification in the “Gazette of India,” fix for the purposes of this Act the value of any goods exported or imported by sea on which duties of customs are hereby imposed.
7. Nothing in Schedule B. hereto annexed applies to pepper exported by sea from the port of Cochin. But on all such pepper there shall be levied such duty, not exceeding nine rupees per khandi, as the Governor of Fort St. George in Council from time to time determines; and at the close of each year, or as soon after as may be convenient, the collector of Customs at the said port shall, after deducting the expenses of collection, pay the duty collected under this section to the Government of Travancore and Cochin, in such proportions and in such manner as the said Governor in Council from time to time directs.
8. Duties of customs shall be levied on goods passing by land into or out of foreign European settlements situate on the line of coast within the limits of the Presidency of Fort St. George, or the Presidency of Bombay, at the rates prescribed in the Schedules A. and B. hereto annexed.
9. The enactments mentioned in Schedule C. hereto annexed are repealed to the extent specified in the third column of the same schedule.

Preamble.

Short Title.

Local extent; commencement.

Duties specified in Schedules A and B to be levied.

Goods partially composed of dutiable articles.

Saving clause.

Construction of Section 27 of Act VI. of 1863.

Power to fix value of dutiable goods.

Pepper exported by sea from Cochin.

Duties on goods crossing frontiers of foreign European states in Presidencies of Madras and Bombay.

Repeal of enactments.

Appendix, No. 8.

„ XVII. of 1870 -	An Act to amend the law relating to Customs duties.	The whole.

This Bill was passed at a meeting of the Council of the Governor General of India for the purpose of making laws and regulations, on the 31st day of March, 1871.

(signed) Mayo, President.

I ASSENT to this Bill.

The 31st March, 1871.

(signed) Mayo,
Viceroy and Governor General.

(An authentic copy.)

(signed) Whitley Stokes,
Secretary to the Government of India,
Legislative Department.

ACT No. XIV. of 1871.

Passed by the Governor General of India in Council.—(Received the assent of the Governor General on the 31st March, 1871.)

AN ACT for the further amendment of the CONSOLIDATED CUSTOMS ACT.

FOR the further amendment of the Consolidated Customs Act (No. VI. of 1863); It Preamble.
is hereby enacted as follows:—

1. Section 23 of the said Act shall be deemed to authorise, and to have always authorised, the Governor General in Council to prohibit or restrict the importation or exportation, by sea or by land, or both by sea and by land, of any particular class of goods. Amendment of Act VI. of 1863, section 23.
2. As often as any goods are lodged in a public warehouse or a licensed private warehouse, the warehouse-keeper, or, in the case of the Bengal Bonded Warehouse Association, the secretary of the said association, shall deliver a warrant signed by him as such to the person lodging the goods. Warrant to be given every time goods are warehoused.
- Such warrant shall be in the form in the schedule to this Act annexed, and shall be transferable by endorsement; and the endorsee shall be entitled to receive the goods specified in such warrant on the same terms as those on which the person who originally lodged the goods would have been entitled to receive the same. Form of warrant.
3. All goods found on board any boat in excess of the boat-note or Custom House pass, whether such goods are intended to be landed or to be shipped on board any vessel, shall be liable to confiscation. Goods found in boat in excess of boat-note or pass liable to confiscation.
4. This Act shall be read with and taken as part of the Consolidated Customs Act. Act to be read with Act VI. of 1863.

SCHEDULE.

FORM OF BONDED WAREHOUSE WARRANT.

(See Section 2.)

I do hereby certify that _____ have deposited in the
warehouse of _____ the under-mentioned goods
_____ which goods the _____ engage
on demand, after payment of rent and incidental charges and Government dues or
Customs chargeable thereon, to deliver to the said _____ or
their assigns, or to the holder of this warrant to whom it may be transferred by endorse-
ment.

This Bill was passed at a meeting of the Council of the Governor General of India for the purpose of making laws and regulations, on the 31st day of March, 1871.

(signed) *Mayo*, President.

I ASSENT to this Bill.

The 31st March, 1871.

(signed) *Mayo*,
Viceroy and Governor General.

(An authentic copy.)

(signed) *Whitley Stokes*,
Secretary to the Government of India,
Legislative Department.

Appendix No. 10.

PAPERS furnished by Major *Bateman Champain*, R. E.

STATEMENT called for in Question 8321.

THE following figures represent the annual receipts and expenditure of the Indo-European Telegraph Department during the first four years of its working, the tariff between England and India being 5*l.* 1*s.* :—

	Receipts.	Expenditure.	
		In India.	In England.
	£.	£.	£.
1865-6 - - - - -	92,467	70,851	45,598
1866-7 - - - - -	93,097	77,859	
1867-8 - - - - -	98,887	76,015	
1868-9 - - - - -	94,478	69,927	
	380,529	294,652	
Add from Profit and Loss, &c. &c., Miscellaneous Receipts - - -	2,495	45,598	
£.	383,024	340,250	

	£.	s.
Average Receipts - - - - -	95,756	-
Average Expenditure - - - - -	85,002	10
Average Surplus of Receipts - - -	£. 10,673	10

From the 1st January 1869 the tariff was reduced from 5*l.* 1*s.* to 2*l.* 17*s.*, and the traffic receipts during 1869-70 fell to 76,126*l.*

In March 1870 the British-Indian Line opened to India, and the receipts of the Indo-European Department during 1870-71 experienced a further fall to 56,250*l.*

STATEMENT referring to Question 8365.

THE tariff having been raised from 2*l.* 17*s.* to 4*l.* 10*s.*, the receipts for the year 1871-72 are estimated at 70,000*l.*, and the working expenses are being reduced from 85,000*l.* to 61,000*l.* per annum as follows:—

	Original.	In course of Re-organization to	
	£.	£.	
Persian Gulf Establishment per annum	35,000	27,000	The sum of 886 <i>l.</i> * per annum trans- ferred to Political Department.
All Allowances and Contingencies, say	15,000	6,838	
Subsidies and Political Charges - -	5,000	3,162	
Persian Land Establishment - - -	17,500	16,000	
All Allowances and Contingencies, say	4,000	5,000	
Superintendence and Contingencies, say	5,000	2,400	
London and Constantinople Offices -	3,500	1,600	
£	85,000	61,000	

* This sum of 886*l.* is half the cost of the Political Agent and his escort.

J. W. Bateman Champain,
Chief Director Indo-Euro. Tel. Dept.

(Question 9755.)

MEMORANDA concerning FAMINES of former times and FAMINES of later times.

C O N T E N T S

	PAGE.
1.—Comparative Statistics of the Famines of 1770, 1860, and 1866—(A. to F.) - -	711
2.—Opinion recorded by the Orissa Famine Commission as to the Comparative Severity of the Famines of 1770, 1860, and 1866; also a Note as to the different conditions connected by the different uses of the term "FAMINE"—(G. and H.) - - -	714

I.—COMPARATIVE STATISTICS of the FAMINES of 1770, 1860, and 1866.

(A.)—FAMINE MORTALITY of 1770.

Dr. Hunter, in "Annals of Rural Bengal," says, "In a year when 35 per cent. of the whole population, and 50 per cent. of the whole cultivators perished, not five per cent. of the land tax was remitted, and 10 per cent. was added to it for the ensuing year 1770-71." (See also the text *passim*, as to a mortality in 1770, estimated by Dr. Hunter at 10,000,000 souls).

(B.)—FAMINE FINANCE of 1770.

TABLE showing proportion of Remissions to Collections given in the Minute of Warren Hastings, reprinted and quoted by Dr. Hunter, "Annals of Rural Bengal."

Y E A R.		Net Collections.		Remissions.		TOTAL COLLECTIONS.			
		<i>Rs.</i>	<i>a. p.</i>	<i>Rs.</i>	<i>a. p.</i>	<i>Rs.</i>	<i>a. p.</i>	<i>£.</i>	
1768-69	- - -	-	-	-	-	1,52,54,850	9 4 3	1,525,485	
1769-70	The year of dearth which was productive of famine in the following year.	-	-	-	-	1,31,49,148	6 3 2	1,314,914	
1770-71	The year of the famine and mortality	-	-	-	-	1,40,06,030	7 3 2	1,400,003	
Demand:									
1771-72	The year after the famine.	1,57,26,576	10 2 1	3,92,915	11 12 3	1,53,33,600	14 9 2	1,533,366	
		£. 1,572,657.		£. 30,291					

Dr. Hunter, speaking of the extent of remissions, says, "Different letters (of the Calcutta Government to the Court of Directors) represent different remissions. Before September 1770, the balance was only 80,332 *l.*; it was afterwards reduced to 65,355 *l.*, out of a total demand of 1,380,269 *l.*" Speaking of the amount spent in relief in 1770, Dr. Hunter says, "The utmost that the Council, when pressed by the Court of Directors as to Government relief efforts, could show, was a distribution of 9,000 *l.* among thirty millions of people, of whom six in every sixteen were officially admitted to have perished. * * * * * Mention is likewise made of public contributions and the importation of rice. But these operations were conducted on a painfully inadequate scale. Districts in which men were dying at the rate of twenty thousand a month, received allotments of 150 rupees (15 *l.*). A provincial council gravely considers, and magnanimously sanctions a grant of 10 *s.* worth of rice per diem, for a starving population numbering four hundred thousand souls."

Appendix, No. 12.

(C.)—FAMINE MORTALITY OF 1860.

(From Mr. Under Secretary Girdlestone's Memoir on Past Famines in the North West Provinces, Allahabad 1869, which mainly cites Colonel Baird Smith's Famine Report of 1861.)

The following is the summary which Colonel Baird Smith gives of the population and acreage within the famine tract, as defined by him in Chart II. of his Report on the Famine of 1860-61 :—

	The Population more or less Distressed by the Famine.	The Population Distressed most intensely by the Famine.
Eastern Section of Famine Tract - -	2,856,000	970,000
Central - - - - -	5,353,000	2,258,000
Western - - - - -	4,870,000	2,220,000
	13,088,000	5,448,000

On the extent of the mortality of 1860, Mr. Girdlestone has the following paragraph :—

“ It is out of the question to give any reliable account of the mortality which resulted from the famine. No general register of deaths was kept at the time, and if there had been such a record, the knowledge that it was framed amid confusion and panic, would very much weaken its claims to accuracy. Isolated statements have been made, and, such as they are, I will repeat two or three of them; but I think that they must be received with caution. Thus on the Meerut district, it is reported that 109 deaths had occurred up to January 22nd, and lately Colonel Baird Smith was told that 7,000 persons had died previously to May, from starvation; but, as he remarks, ‘many among these are from other causes than actual starvation.’ The population of the district at this time was a little more than a million. To the returns of Mr. Colledge, collector of Boolundshuhus, he is inclined to give more credence on account of the care with which they had been compiled. The result which they show is, a mortality of over 24,700, or about 3½ per cent. of the population. But even this statement admittedly the best of a bad lot, depends on nothing more than oral testimony for its worth, and if this is the case, it would be a mere waste of time to multiply examples. In this matter, we must be content to know that excessive mortality did ensue, but what its amount, even those who were living amid the suffering had no means of estimating.”

Mr. Girdlestone adds in a foot-note, “ Sir Arthur Cotton estimates the mortality [of the famine of 1860] at 200,000 at the very least (see page 5 of “The Famine in India.” A lecture delivered before the Social Science Congress in Manchester, 12th October 1866).”

(D.)—FAMINE FINANCE OF 1860.

FINANCE of the Famine of 1860-61 in the North West Provinces, from Mr. Girdlestone's Blue Book above cited.

	£.
Expended in the distribution of food - - - - -	54,178
Expended in advances for the purchase of seed and cattle - - - - -	34,031
Expended in minor relief works - - - - -	2,991
Expended by Government only on public relief works - - - - -	91,429
Remitted of revenue demand - - - - -	23,464
£.	200,083

(G.)—OPINION recorded by the Orissa Famine Commission (President Mr. Campbell, now Lieutenant Governor of Bengal), on the Comparative Severity of the Famines of 1770, 1860, and 1866. (From Parliamentary Blue Book No. 335, of 1867. Part I. of Report, paras. 70, 71, 72, 73, 74, pages 228-231.)

" 70. We have not yet been able to obtain any details of the great famine in Bengal of 1770; but comparing the recent famine with anything which is known to have occurred in India in the present century, we incline to the opinion that this in Orissa has been, while it lasted, the most intense. By far the severest Indian famine which is widely and well known, and probably in truth quite the severest of the century till the present, is that in the North Western Provinces in 1837-38, and that may therefore be taken as the standard of comparison. It was spread over a wider surface; the natural calamity was probably greater; the injury to the agricultural community more severe, and the fiscal effect more lasting; but the people had much greater facilities of emigration, and especially there were very much greater facilities of importation of grain, and an energetic trading class to avail themselves of those facilities. The famine in Orissa stands almost alone in this, that there was (till a comparatively late period of its history) almost no importation, and the people, shut up in a narrow province between pathless jungles and an impracticable sea, were in the condition of passengers in a ship without provisions. Things came to that pass that money was spurned as worthless. Prices were constantly merely nominal; where rice was to be bought at all, it reached the rate of five, four, and even three Calcutta seers (of 2 lbs. each) per rupee at the chief stations where the external relief afforded was greatest, and in the interior of the districts still higher rates are reported, even to one seer per rupee. These rates are far beyond those known in any famine in this century of which we have information.

" 71. The famine of 1837-38 is so well known an event that it is singular how little connected account of it is to be found, as may be judged from the references to it in Colonel Baird Smith's report. That it was very terrible there can be no doubt; the famished people seem to have wandered far in a most miserable state, and it lives in men's minds in most painful characters. But a very large proportion of the sufferers seem to have dragged on their existence to die of disease the following year, which is said in that shape to have been almost more fatal than that of the actual famine. In Orissa the work of destruction seems to have been more speedy. The more rapid course of the calamity sooner eventuated in death or life, and while, as we believe, a larger proportion died in a few months, we found that in December and January last the mass of the surviving population of the country visited by us seemed to be already in comparatively good ease and free from remarkable disease, if we except small-pox, which is hardly a famine disease. During the famine, people seem to have survived for a time as living skeletons reduced to a state which would have been impossible in a colder climate; but we fear that almost all these unhappy people died at last, and that of the poor creatures whom we saw still maintained at the relief centres, and whom we may call the residue of the famine, many will never really recover.

" 72. Colonel Smith's information regarding the famine of 1837-38, was avowedly very incomplete, and even allowing for the difference in the general scale of prices in these days, it seems now hard to imagine such severity of suffering if prices were never and nowhere dearer than those mentioned by him. Yet he says that, after careful inquiry, he had not been able to ascertain that in any instance the price of wheat rose higher than 11½ seers per rupee. The ordinary price of wheat in the 12 years preceding that famine seems, from Colonel Smith's tables, to have averaged at Agra about 30 seers per rupee. It was cheaper to the north, dearer to the south-east; and 30 seers may be taken to have been about the average of the country. In Orissa the average price of rice, as shown in returns for each district (ranging over four to seven years immediately preceding the famine), which we have obtained from the Commissioner, may be taken to have been about:—Pooree, 32 seers per rupee; Cuttac, 34 seers; Balasore, 32 seers; or for the whole province say about

about 32 to 33 seers; * so that it is evident that in Orissa in 1866, the pressure of prices both actual and comparative was very much more severe than in the North Western Provinces in 1837-38. On the other hand, a fixed and good settlement, the receipts in payment of grain exported, and the absence of any widely extended succession of bad years, had probably made money more abundant in Orissa. Colonel Smith mentions that the daily burials by the police at Agra were at one time reported to average nearly 400, which is greater than at any station in Orissa, the largest number of bodies disposed of by the police at Balasore in any one day being 245; but Agra is a much larger place; it was the centre of a much larger country, the metropolis, not only of the country, but as it were of the famine, to which people flocked from all quarters; upwards of 80,000 working paupers being maintained from public funds at that one station alone; and the means of the police at Balasore were unable to reach the bodies of those who died in the fields and bye-ways; many skeletons in fact lie there to this day. The order, quoted by Colonel Smith, from the books of the station of Cawnpore (also one of the worst places in 1837-38), directing the hire of a boat and small establishment to remove the bodies, seems hardly to equal the exigencies which occurred in Orissa.

"73. The famine in the North Western Provinces in 1861 cannot be compared in respect of the intensity which it actually reached with either of those which we have been contrasting. Colonel Smith indeed supposes the natural calamity in 1860 to have been nearly as great as in 1837-38, although he does not estimate the failure of the crops in 1860-61 to have been by any means absolute and total throughout the distressed country. The high prices which occurred in 1860-61, in the early part of the season, were relieved by enormous and most energetic private importations. The gentleman who was then Commissioner of Delhi tells the President that the grand trunk road was said to have been worn out in 15 days by the enormous use of it, and the President himself saw the railway stations between Allahabad and Cawnpore blocked up with grain awaiting transport, and every cart, bullock, camel, donkey, in short every means of conveyance available in the country, in active use to transport grain from Oude. Public works were early undertaken on a great scale, under special arrangement, to make them expressly available to the starving, and public subscriptions flowed in with such liberality that the overplus remained of which so valuable use was made in the famine on which we now report.

"74. A most important lesson is, we think, distinctly to be learned from the study of Colonel Smith's report. We are not quite sure whether, in estimating the losses, he takes fully into account the great destruction of the inferior grains of the rainy season, which depend solely on rain, or chiefly refers to the subsequent crop of which he saw the failure before him, the wheat and other main staples, a great portion of which is always kept alive by artificial irrigation; but his estimates seem to show that, in his opinion, the failure, taking broadly the whole of the distressed districts, did not exceed that which was from the first admitted in the most sanguine estimates to have occurred in Orissa in 1865, viz., half the produce. He specifically states the loss in several of the bad districts at about 4-10ths, in some it was more, in some it is estimated to have been less. The famine country of 1861 is, generally speaking, a grain-producing country. With the exception of a good deal of cotton in some portions of it (and the cotton cultivation had not then been abnormally extended), food grains may be said to be the main staple throughout, and in good years there must no doubt be a large surplus produce. Particular estimates apart, it is plain that the failure of the produce of the whole tract was not complete, that there was in parts (good and bad being intermixed) a very considerable yield. Yet it is abundantly evident that if there had been no importations and no relief works the famine would have been frightful and very fatal. It may be assumed then, as the result of Colonel Smith's inquiry, that in the ordinary modern condition of things in India, something much short of the entire and absolute failure of the whole crops of a year in any province will suffice to produce that state of extreme famine when food is scarcely to be had for money, if the market be not relieved by importation from provinces more abundantly supplied. Still more will this be the case when either by previous short crops, or by exportation, or both, the stocks have been already reduced below average; and as respects a famine caused by absence of grain as distinguished from one caused by absence of money, the effect of previous short crops and of exportation is much the same. Modern enterprise and means of communication in relieving countries insufficiently supplied, drain those in which grain is more abundant to an extent which probably did not occur in the old days of native hoarding. In fact, in India, where famines have generally been present to the memories and traditions of the people, the want of means of communication was much counteracted by the disposition to hoard largely the grain for which little could be got in years of abundance. An unhappy combination of circumstances which renders exportation in time of abundance large, but brings no importation in the time of want, produces such terrible calamity as has just occurred in Orissa."

(H.)—NOTE

* The Cuttack prices given by the Commissioner are stated to be exact, being taken from account of actual purchases made by the French merchants in the years preceding the famine. Probably they may have purchased at the times and places most advantageous to themselves, but, at any rate, it seems clear that even after the enhancement of recent years the rate of rice in Orissa did not average less than 30 seers per rupee, and was generally cheaper.

Appendix, No. 12. (H).—NOTE by the Orissa Famine Commission, as to the different senses attributed to the word Famine in earlier as compared with modern histories, or in one modern record as compared with another and contemporary modern record. (Para. 79, page 232, Part I., Orissa Famine Blue Book.)

"79. It will be self-evident in the whole of our proceedings that there is an extraordinary discrepancy in regard to the use of the word 'famine' by different persons. In some of the earliest papers the word was freely used; but the failure having been early called in official documents 'scarcity' and not 'famine,' it seems as if, as the scarcity and want became more intense, the official use of the term 'famine' was gradually pushed back into narrower and narrower limits. The Board of Revenue, in their Administration Report of 20th August 1866, under the heading 'the scarcity,' seem to maintain that there was no 'famine' in Orissa till the very last days of May; and they appear, in fact, to desire to restrict the word to the case when there is not food to be had for money as distinguished from suffering from dearth and want of means to buy. In that sense it might be said that there was no famine in the North Western Provinces in 1837-38 or in 1861. One gentleman holding a high appointment, which gave him special means of obtaining information, has gone the length of telling us that he does not remember to have heard of general famine till the floods of August occurred. We shall use the word 'famine' in its ordinary and popular acceptance of suffering from hunger on the part of large classes of the population."

(A).—From a Minute by *R. H. Davies*, Esq., Officiating Commissioner of Oude on the Comparative Merits of British and of Native Administration.

"The inaction of the village zemindars in Oude whom we had favoured was not because they did not wish to have the settlement of their villages. It is to be explained by the want of combination amongst themselves, by the very good reason they had to consider our Government at an end, by their clannish sympathies with their chiefs and the sepoys, by the delay of our military movements, by the exposure of the lives of individuals who gave intelligence to us. After all, they were in rare instances actively hostile. As a nation, they were not opposed to us, and though I contend that agrarian measures may keep them neutral, I do not say that, in difficult circumstances, they will certainly enlist their aid."

"I submit, however, that the neutrality of the masses is the corner stone of our supremacy. It is for some reasons far more important to us than to a native Government to place the agricultural population in comfortable circumstances. In a state of never-ending war and confusion there is not the steady increase of population which follows on the restoration and fixed maintenance of peace and order. *The inferior soils come under cultivation; the yield is smaller in proportion to the labour; the rude plenty of less crowded times recedes; an uneasy sense is felt of an intenser struggle more scantily rewarded. This, I am told by observant natives, is the spreading sentiment among the rural classes. The complaint is that there is no burkut under the British Government. It may be remembered that*

"that Colonel Sleeman mentions exactly the same grievance being adduced by the Jats of the Delhi territory.* The meaning is that the toil is greater, nature more niggardly, the battle of life harder. The agrarian mind attributes the change to the foreign rule, to the remittance of money to England, to the decay of native manufactures, to anything in short which runs counter to its prejudices. But here we have in reality the eternal problem which meets all peaceful governments, native or foreign. We may place a population in a position to receive the fair reward of its labour. But we cannot alter physical laws, nor can these be violated with impunity. [Still the primary conditions of the growth of moral and reflective checks on the increase of population must be the possibility of saving the fear of falling lower.] With these there is always hope of amelioration. Yet adverse circumstances may intervene, and it is no doubt possible that, in spite of the most liberal provision, a population may multiply so as to remain ill-fed, ill-dressed, brutal, and ignorant."

Appendix, No. 12.

(Sic orig.)

(B).—From Major C. F. Prestcoat, Superintendent, Revenue Survey and Settlement in Guzerat, Acting Commissioner of Survey and Settlement, N.D. to the Under Secretary to the Government of India, Foreign Department.—(Dated Poona, August 15th, 1867.)

"In the absence of Colonel Francis, I have the honour of replying to your confidential Circular of the 1st of July regarding the general feeling of the natives of this country towards British rule, and the comparisons they draw between it and Native Government."

"I will, with your permission, premise by saying, that, so far as my experience goes, the feelings of the rich and the poor, of the landed proprietors and the commercial classes, of the Mussulmans and Hindoos, on the subject, are very different."

"There cannot be a shadow of a shade of doubt that the masses are in every respect more prosperous and happy in British territory than in native states; but I doubt very much whether the rising generation (which has never experienced the bitter oppression of former days) really think so."

"Even in the most prosperous districts where the people are contented, happy, well-fed, well-clothed, and with all the evidence of plenty around them, they are apt to attribute whatever is evil to the *raj*, and whatever is good, not to the *raj*, but to the *dhurm*. Any rise in prices is the fault of the *raj*; any scarcity, the same; any new taxation is not for the good of the people and the country, but only the means resorted to, to satisfy the greed of England for India's wealth."

* * * * *

"In conclusion, I may relate (as an illustration of the discussions which are continually going on amongst the people as to the why and wherefore of certain acts of the British Government) a conversation I myself overheard between two respectable thakoor on the subject of the Disarming Act. Said one, 'What does the *Sirkar* mean by disarming respectable people? Will it make us more faithful, or like the *raj* better?' To this the other replied, 'Oh! it is not because they are afraid of us or mistrust us, it is only because they want the *iron* to make railroads. Look (said he) what hundreds of miles of rails they are laying down, and if they don't collect and melt down all the arms they can get hold of, where is all this *iron* to come from?'"

(C.) From a MINUTE by the Honourable A. A. Roberts on the Comparative Merits of British and of Native Administration.

"Still I question whether the assertion made in your third paragraph, that the masses of the people are incontestibly more prosperous, and (*sua si bonâ norint*) far more happy in British territory than they are under native rulers," is not too broadly stated.

"Certain sections of the people, as the smaller landed proprietors or a portion of them, and also some of the trading classes, are perhaps better off than they were; but the masses,—the tenants, and farm labourers, artisans, domestic servants, and others, earn no more in British territory than elsewhere, ought but a bare subsistence for themselves and their families. The price of food and of all the necessities of life has risen so enormously within the last few years, that I doubt, although there has in some parts been a proportionate rise in wages, whether the masses are so prosperous as they were before the mutiny, or as they used to be under the Native Governments. An intelligent native observed to me the other day, that it was the general remark that famine prices had prevailed for several years. I have certainly observed that for the last six or seven years, the average price of wheat flour in the North Western Provinces and in the Punjab has not exceeded 18 or 20 seers for the rupee, while the

As to absenteeism and its effect, on Indian land-tax, see Vol i., chap. xxxi., and compare therewith Judge Longfield's Observations on Absenteeism and its Effects on Irish Agriculture. Cobden Club volume on Land Tenures, pp. 9, 10, 11, 40. J. G.]

Appendix, No. 12. the price of rice in Bengal has been rather dearer. These rates are to the masses famine prices, and the people feel and say that these prices are one result of British rule. *Another remark which the same individual made to me was, that the idea was very prevalent that sickness had greatly increased under our rule; that people were not so robust as they used to be, and that they rarely now-a-days attained to an old age.*

"I have long been under the impression that the mortality among natives is excessive, and the census of the North Western Provinces, which was taken in 1865, and which shows a decrease of upwards of a quarter of a million on the population of 1853, tends to confirm this view. It is unreasonable to attribute this diminution either entirely, or in any great measure, to the mutiny. A decade has since passed, and there has been ample time for an increase of population. The people talk of these things and attribute them partly, if not entirely, to a visitation of God, consequent upon the introduction of British rule, and draw an inference unfavourable to it.

"I accordingly see reason to doubt whether the people at large either think themselves, or really are, more prosperous or more happy under our rule than they were under Native Governments. I have no doubt myself, that India is progressing towards material and moral improvement; but I do not think that we have done all that we might and ought to have done, nor have we been at the pains to convince the people of what we are doing for them. *The gulf between us and our native subjects is becoming wider year by year. It is wider in Bengal than in the North Western Provinces, and it is wider in the latter than in the Punjab. It is becoming wider every year in the Punjab.* Our executive officers, partly from increase of work, and partly either from want of inclination, or of not understanding the necessity and advantage of friendly intercourse with the people, see less and know less of them than formerly, and they know less of us, and misunderstand us and our motives and acts."

(D).—From Part III. of Report of Orissa Famine Commission, paras. 8 and 41 :—

"8. The observations in the earlier part of our report rather tended to the opinion that, with all our modern progress, we are perhaps not better prepared to meet these great natural calamities than was India a hundred years ago; that the improvement of our communications may be counteracted, for the purposes of this question, by the diminution of the tendency to hoard the grain of years of abundance, formerly in such times so valueless; the increase of cultivation by the increase of population and by the increased proportion of the soil devoted to other products than the food of the people; the increase of wealth by the increased demand for both necessities and luxuries. Our best means of communication would be sorely taxed to supply food to 50 or 60 millions of people, and if they could convey such quantities, they would not be effectual, unless sufficiently abundant sources of supply actually exist. *It has been the common native belief that great famines are never the consequence of a single bad year; that they occur only when a bad year or years are followed by one of extreme failure. The idea seemed to be that the old hoarding system, combined with the ordinary course of trade, insured a sufficiency of grain to carry the population of any province through a single bad year, and that it is only when the stocks have been already much diminished before such a year, that the most absolute starvation has resulted.* Whether or not this belief may have been true in former times, the experience of the Cuttack and Balasore districts seems conclusively to prove that a long course of peace and prosperity and previous good years, afford, under modern conditions, no sufficient resource against a single year of failure, *when there has been much exportation, and circumstances render importation exceptionally difficult.*

* * * *

"41. We have before said that so long as the food supply of India, as a whole, suffices, and famines are confined to particular provinces, it may be hoped that efficient means of communication will go very far to save peoples prosperous under peace and good government from the worst effects of seasons of failure. *But we have noticed that of late years there has been some reason to fear that throughout India generally we have trenched to a dangerous extent on our food reserves, and that it is a question whether the concurrence of many demands on our agricultural resources may not in fact render food permanently scarcer and dearer.* We have also suggested our fears that more general climatic derangements than any which have been experienced since the British Empire in India attained anything like its present extent, may be expected to recur at long intervals; and the experience of all countries seems to show that the tendency of an increasing cultivation, and the denudation of natural forests and jungles, is to render the seasons more extreme, droughts more severe, and floods more rapid and extensive.

"If all this be so, the question of increase in the food general supply seems to assume an importance greater than some might have been inclined to attribute to it in a country where the supply has generally exceeded the needs of the inhabitants, and in one quarter or another the markets have not unfrequently seemed to be glutted by excessive plenty. Probably the only mode in which the Government can directly aid in increasing the food supply is by great works of irrigation, to which in fact its attention is now so much given."

(E).—From

(E.)—From Part III. of Report of Orissa Famine Commission, paras. 63, 64, 65.

"We have already alluded to the effect of changes which, while rendering the person more free, society more advanced, and labour in one sense more independent, may also, by loosening the ties of personal inter-dependence, render the poorer classes less capable of withstanding calamities of season. We must repeat a doubt whether the labouring classes of England or France could withstand a general enhancement of the price of food to twice or thrice its ordinary price, as do the natives of India. Suppose the price of wheat to be suddenly raised to 120 or 150 shillings per quarter, beef and mutton to half a crown a pound, and all other articles of food in proportion, what would be the state of things then or even long before that point had been reached? That is, in fact, much the same thing which occurs in India, when rice in Orissa or wheat at Agra rises to 11 or 12 seers per rupee, and yet up to that point the people of many districts of India seem to be now, under favourable conditions, prepared to bear up for a time. But we must not blind ourselves to the fact that every step in advance, in the modern sense, tends to render them as dependent on daily wages as more civilised labourers. Under the purely native system, almost every man is more or less a farmer, or the immediate personal dependent of a farmer who has his banker and his banker's book, and the credit which enables him to live from year to year, rather than from day to day. *But all our commerce and our enterprise, our great works and improved systems, create or increase the class of labourers depending on regular wages; and all increase of private wealth, enabling the richer to entertain labourers who are no longer slaves or serfs, adds to the class.* If we should succeed in simplifying property in land in the hands of sole proprietors of considerable estates, the mass of the peasantry must either become labourers for hire, or tenants-at-will whose rents are regulated on commercial principles, and who have no longer the beneficial interest in the soil on which their present credit is founded. It may be that with the increase of general wealth, the labourer will eventually be, in ordinary times, better off than he ever was before, but that he will as well resist extraordinary seasons, we do not deem probable. *There is, we believe, reason to expect a gradual increase in the classes who may hardly withstand a scarcity not amounting to that extreme famine which involves the whole population.*

"64. On the other hand, if the accumulation of wealth increases the number of rich and charitable residents of large towns, the need on the part of the rich for luxuries before unknown very largely increases; the feudal inter-dependence of the people diminishes as native rulers are exchanged for proprietors, and *the native public endowments and charities diminish in number and in efficiency when no longer supported by native Governments and official superintendence.* On the whole, *the sources of voluntary relief of the poor are probably diminished.*

"65. The disadvantages attending any poor-law are so great, that we would still not recommend that resource in ordinary seasons. We have several times alluded to *the wonderful way in which natives recognise the personal obligations of supporting their own poor.* As long as any of a family, it may almost be said any of a clan, have the means of supporting their indigent relations and connections, they do so in a marvellous and admirable way. Only when calamity either reduces whole families and classes to starvation, or brings them so low that, on the principle of two on a plank, some must inevitably be sacrificed, large numbers are cast out either to die or to be saved by public charity. So long as the social feeling which dictates the sacrifices enabling the natives to support one another may suffice, hard as the system may appear on the poor, we would not interfere. Any action which should endanger the present ties might bring with it other and greater evils."

(F.)—STATEMENT exhibiting the Moral and Material Progress and Condition of India, during the Year 1868-69.

INTRODUCTION.

AMONG the numerous interests which claim attention in "A Report on the Moral and Material Progress of India," it is not difficult to select three topics which give an individuality to the year 1868-69. They are, the retirement of the late Governor General Sir John Lawrence, at the end of his term of office, and the advent of his successor, Earl Mayo; the drought which caused distress and anxiety throughout the greater part of British India, and severe famine in Rajpootana; and the serious deficit which became apparent at the close of the financial year.

Sir John Lawrence was appointed Governor General at the close of the year 1863, on the death of Lord Elgin. He brought to bear upon the Government of India the weight of his great ability and long experience, and his retirement closed an active career of 40 years, devoted continuously to its service. On his return to England Her Majesty was graciously pleased to raise him to the peerage under the title of Baron Lawrence of the Punjab, and of Grately in Hampshire. Earl Mayo took the oaths and his seat as Governor General at Calcutta, on the 19th January 1869.

The drought was wide spread, but unequal in severity. Rajpootana with its area of desert and its scanty water supply was most affected. It is usual for the population of the more arid districts to migrate to some of the more favoured neighbouring states, but on

Appendix, No. 12.

this occasion all were visited alike by the scourge, *which was the most calamitous on record*. Thousands of the famine-stricken poured into the British territories in search of food, greatly aggravating the burden already felt there. In the Central Provinces, the drought though less severe, was universal; in the North Western Provinces, the northern districts and those bordering on Rajpootana suffered most; in the Punjab, those south of the Sutlej. In Madras there was slight anxiety, and in the Lower Provinces still less.

A detailed narrative of the distress and of the measures taken to avert it, is contained in the chapters devoted to the two first named provinces. On the political aspect of these measures, so clearly set forth by Mr. Morris, Chief Commissioner of the Central Provinces, it will be interesting to quote the following from that gentleman's report.

"It must be never forgotten that the measures initiated by the Government in 1868 amount in fact to a new policy. In the earlier years of British rule State assistance was limited to the native method of remitting revenue, but this under the native system was only one part of a general scheme which turned on a full recognition of the State as landlord. The Mahrattas probably laid more stress on the rights of property than on its responsibilities, but the greater the share which they assumed of the fruits of the soil, the more helpless they left the cultivating classes; and therefore to prevent an entire collapse of the agricultural system, they were bound to regulate its machinery minutely and watchfully, and in times of difficulty to take almost the whole burthen of supporting farmers, who had never been encouraged, or indeed allowed the opportunity of standing by themselves. Thence arose the yearly fluctuation of the assessments, to adapt them to the seasons, and the storage of grain in warehouses, whence seed and food grain were lent to the people to be repaid with interest at the first good harvest. Our revenue system, even before it had developed a proprietary body independent of the State, leant towards European models, and attempts were made from the first, by fixed revenue settlements on comparatively light terms, to wean the land farmers from their dependence on authority. Hence the Government retired from its position as a grain-dealer, and though our system was obviously better calculated to promote the prosperity of the country in the end, it is questionable if at the commencement of British rule the poorer land-holders did not sometimes look back with regret to the days when they had to exercise no thought for the morrow. In another important branch of relief, the support of the old and infirm poor, our predecessors had a method which it was not easy to replace. The richer inhabitants of the famine-stricken districts or tracts were authoritatively invited to succour their poorer neighbours, and thus the Government provided for its starving subjects absolutely without expense. The few thousand rupees which the English Government distributed among millions of people in the first outbreaks of distress with which it had to deal, were a poor substitute for the enforced charity of hundreds of rich men, and even the subsequent system of large Government relief works in selected places, and relief Committees distributing alms, contributed half from private sources and half from State grants, left a good deal dependent on private impulse, and certainly failed to search out the whole of the existing distress."

"The policy adopted during the past year, though in form but a development of former measures, was animated by the bold enunciation of a principle which, if not previously denied, was at least never so unreservedly admitted. The State has now publicly announced its responsibility for the life of the least of its subjects, and has proved to them its good faith by a measure of liberality, regulated rather by the wants of the people than by precedents or calculations."

In Parliamentary Returns already published the Indian Accounts have been detailed with all fulness. It seems, therefore, scarcely necessary to notice in this Report more than briefly some of the main points connected with them.

The *gross revenue* of the Empire (including some small receipts in England, 177,436 £.) realised 49,262,691 £., and exceeded that of 1867-68 by 728,279 £. The *expenditure* amounted to 52,036,721 £., or 2,494,614 £. more than in the previous year.

There was thus a deficit of 2,774,030 £. or, if the expenditure be made to include Public Works extraordinary, one of 4,144,643 £.

On the side of receipts there was an increase under nearly all the heads; but in three of the four principal feeders of the revenue, land, salt, and opium, which together produced close on 34 millions out of the 49 millions, there was a falling off. Land revenue yielded 19,926,171 £. The decrease of 60,000 £. compared with 1867-68, which this represents, was a consequence of the unfavourable season. So was the decrease of 137,853 £. in salt, which produced 5,588,240 £. The most serious falling off was, however, in the opium returns, which yielded 8,433,365 £., or 470,203 £. less than in 1867-68, owing to the smaller cultivation in the Malwa State, doubtless also a result of the season.

On the expenditure side the chief item of increase in India was "Public works ordinary," which had allotted to them 6,433,517 £. or 633,248 £. more than in 1867-68, and 460,177 £. more than the estimate. The relief works for the employment of the distressed were the principal cause of the unfavourable difference.

The famine which desolated Rajpootana more completely than any other part of India, and the general backwardness of this cluster of independent Native States, owing partly to misrule, partly to the very unsatisfactory relations of the chiefs with their thakoors or nobles, are the two facts that stand out prominently in reviewing the events of the year.

The famine will be felt for many years to come. It surpassed in severity even that of 1813, which was the most calamitous in Rajpootana of which there is record, for whereas then grain failed, there was plenty of grass, and the herds were saved; but in 1869, the scarcity of grain, severe though it was, was trifling compared with that of forage. It is believed that three-fourths of the cattle have died or been sold out of the country, and the

most

most calamitous mortality among the people was only averted, by the facilities which the railway lines afforded for the transit of grain. The famine, though general throughout Rajpootana, was most severely felt in Marwar. Here scarcity of grain is common, and the people find relief by emigrating to the neighbouring states, returning with the approach of the rainy season; but on the present occasion, their usual refuge failed them; their neighbours were afflicted equally with themselves. *Mahway is more than ever given up to opium,* and dispersing in various directions, streams of emigrants poured northwards to Delhi and the Punjab, westwards to Guzerat, while from the south-eastern portions of the country, multitudes passed into the Central Provinces, numbers of them dying by the way. "Some are left to be devoured by dogs, and others are buried a few inches below the surface of the ground, and always in nulla beds, that the remains may be swept down by rain to the sacred rivers."

"it is difficult to estimate the number who emigrated. The northern portion of Marwar is deserted. In the more fertile portions, the towns are still inhabited, but the villages are as villages of the dead; only a few women and one or two old men being left to look after the houses." "There is no doubt that the population of the country will be permanently diminished by one-fourth. Many will settle in the countries to which they have emigrated, and the misrule and want of good government which has prevailed for the last few years in Marwar will deter others from coming back." The failure of the grass obliged the people to take with them the greater number of their cattle. Of 2½ million head of cattle in Marwar, nine-tenths, it is estimated, were taken away by the departing emigrants. The one-tenth that remained may be said to have died off, while an almost equal mortality appears to have followed the herds. Looking to the future, the prospect was gloomy. "The cattle left in the country are not sufficient to plough one-tenth part of the land usually sown in the Khureef. The cattle, with the returning emigrants, will not arrive till the new grass is sprouted, too late for the season's sowings, excepting of vetches and inferior grains, the produce from which will not compensate for the drain on the stocks caused by the demand for seed and the extra number of mouths; moreover, there is little hope of import of grain from neighbouring countries, and each State must depend on the stock she herself holds."

It is pleasing to learn that the chiefs have, as a rule, done all in their power to relieve the sufferings of the people, by the remission of taxes, and by the removal of the prohibitive restrictions on grain which, from an erroneous conception of their duty to their subjects, they at first imposed when scarcity showed itself. In this enlightened policy, the lead was taken by the Maharajah of Jeypore, who has shown himself to be the most advanced in the cause of progress of all his countrymen. His firm support has overcome the opposition of the conservative thakoor and State officials to the recently established "council." This body, which aids his Highness in both a consultative and executive capacity, has of course, not been in existence long enough to become perfect, but it has already displayed a marked superiority over the former Government, and both in devising and carrying out reforms, and in the despatch of business, has gained the praise of the Political Agent. Indeed the progress of the State of Jeypore, during the past three or four years particularly, is the subject of special remark on his part.

As in the other States of Rajpootana, famine here also pressed heavily. In the most favoured localities, the yield was about one quarter of the average, while in others it was even less. The Maharajah's generosity during the crisis was not confined to the removal of the transit duties on grain, though as it was entirely opposed to long established custom, this measure deserves the largest share of praise; famine works were instituted by the Durbar; consideration was paid to the helpless poor and the aged and infirm. The charity shown by individuals was also most praiseworthy. The Maharajah's relief measures received the thanks of Government, and the reward of an increase to his salute from 17 to 19 guns.

1866	1,274,000	211,248	1,485,248	748,145	132,743	880,888	1,378,467	672,577	2,051,044	3,400,612	1,016,568	4,417,180	943,445	5,360,625	
1867	1,328,856	206,278	1,535,134	641,856	108,697	750,553	1,214,597	644,626	1,859,223	3,185,309	959,601	4,144,910	993,011	5,137,921	
1868	1,601,173	232,940	1,834,113	802,113	109,694	911,807	1,309,813	728,780	2,038,593	3,713,099	1,071,414	4,784,513	1,083,376	5,867,889	
1869	2,143,610	256,390	2,400,000	702,716	126,605	829,321	1,782,465	779,040	2,561,505	4,698,791	1,162,035	5,790,826	1,249,174	7,040,000	

N.B.—It is to be observed that the foregoing figures relate rather to grants and amounts sanctioned for expenditure than to actual expenditure incurred, and which differences no doubt, on each head of service, or in each Province, may be very considerable; but as such differences tend to compensate each other, when collected together in an aggregate form, it may therefore fairly be presumed that the grants represent the actual outlay.

Appendix No. 13.

PAPER handed in by Mr. Thornton.

Appendix, No. 13.

MEMORANDUM by Lieutenant Colonel F. H. Randall, R.E., Chief Engineer, Bengal, Irrigation Department, accompanying the submission of the Plans and Estimates of the various Works comprising the Orissa Project, as designed and executed by the East India Irrigation Company.

CHAPTER I.

THE series of irrigation and navigation works about to be described are those which have lately been purchased by the Government from the East India Irrigation Company, and are known as the Orissa Project.

This scheme originated in consequence of a report on the condition of the Province of Orissa made by Sir A. Cotton so far back as 1858, when he was ordered by the Government of India to proceed to Cuttack for the purpose of reporting on the measures necessary to save the city from the destruction with which it was then threatened from the River Mahanuddy, or rather from that branch of it called the Katjooree, which had begun to undermine the whole Mahratta Revetment that surrounds the city. Introductory observations.

While on this duty, Sir A. Cotton's attention was attracted to the condition of the districts comprising the Cuttack commissionership, and finding that they were very similarly circumstanced to those districts bordering the Godavery, where the great scheme of irrigation works had begun to yield such valuable results, he recommended the Government to consider the propriety of entering upon a similar series of works for Orissa.

While the subject was occupying the attention of Government, the Irrigation Company who had been encouraged to commence operations in Madras, offered to carry out a scheme in Orissa on the basis of Sir A. Cotton's recommendations. After considerable discussion, the offer of the Company was accepted, and a contract entered into with them for a scheme of works combining irrigation with navigation, one of the main features of which was to open continuous water communication between Cuttack and Calcutta.

In order to assist the Irrigation Company in designing and starting their scheme, the Government of India were pleased to place my services at the Company's disposal to act as their chief engineer. I remained with them in that capacity nearly five years, and during that period the various works hereafter to be described were designed and put in hand, and have now reached various degrees of completion.

Now that the works have become Government property, and the Governor General in Council has pronounced it to be requisite that the scheme, as originally designed, should be reviewed in all its details, and the calculations tested, it will be necessary for me to commence from the beginning, and, after explaining the principles on which the scheme, as a whole, is based, proceed to describe in detail each series of works of which it is composed. In doing this, of course much that has been previously written and laid before the Government will unavoidably have to be repeated.

The area originally contemplated to be embraced by this scheme comprises the five alluvial districts contained between the frontier in the district of Ganjam belonging to the Madras Presidency and the River Hooghly near Calcutta, and contains about 6,000 square miles. This tract of country consists chiefly of a succession of deltas formed by the several rivers which flow through it.

Limits of scheme.

Pooree.
Cuttack.
Balasore.
Midnapore.
Hidgallee.

From the Chilka Lake to Balasore the chain of the Eastern Ghauts runs more or less parallel with the coast line, being 60 miles distant from it at the point where the river Mahanuddy first debouches on the plains, and approaching it within 15 miles again at Balasore.

In Sterling's History of Orissa, it is stated that the Mahrattas, who, in the course of their career of conquest through India, found their way to Orissa, being enchanted with the multitude of its temples, its beautiful groves of trees, the number of rivers by which the country was traversed, and the appearance of fertility which its great rice plains presented, pronounced the country to be one continual "Tirth" or scene of festivity. However, notwithstanding these evidences of apparent prosperity, the history of Orissa during the past century shows it to have been the scene of periodical distress, and subjected to those visitations which are common more or less to all the deltas of Southern India, and which generally culminate in some such overwhelming calamity as that which lately befell that province.

Condition of Orissa during the past century.

Extreme drought in one year deprived it of food. Extreme flood in the succeeding year destroyed the hope of the anxiously expected harvest. Its isolated position, from want of proper communications, aggravated those calamities, by placing it beyond the reach of succour from localities which could have ministered to its want.

It was with the view of preventing such calamities, by using the experience gained in similarly circumstanced provinces, that the scheme of the Orissa works was planned.

Appendix, No. 13.

Its isolation.

In the year 1862, when the Irrigation Company first commenced its operations, the only means of communication with Orissa were by what was called the Grand Trunk-road, which was at that time little more than in a state of formation, and consisted of high earthen embankments, in many places not consolidated, with no metal covering, and but few bridges. Consequently during the rainy season the post from Calcutta was often 10 days in transit, the telegraph wires when most required were carried away at the river crossings, and Orissa became to all intents and purposes cut off from the rest of India.

It is true there was the safe and convenient, though small, harbour of False Point, but vessels rarely resorted to it, and it was with great difficulty that ships could be chartered in England to bring out the machinery for the irrigation company's works, owing to there being no information obtainable about the port. Beyond the fact that there was a lighthouse erected to warn every body of the coast, nothing was known, and when at last the first two ships did venture there, it was with the greatest difficulty that the commanders could be induced to bring their vessels within the sheltered port, instead of remaining anchored out in the open roadstead. From its having been so rarely visited, no cargo boats were procurable; and as the only boats available were those belonging to the lighthouse superintendent, viz., a small cutter and lighter, almost everything had to be landed at much risk in river boats sent down all the way from Cuttack. Had not the Mahanuddy fortunately been navigable for boats of very small draught, there would have been no possibility of bringing up any of even the lighter stores. The greater part of the heavy machinery had to be landed at the head of the tidal reach of the river, and to be kept there till the rainy season, when the rising of the river would admit of suitable boats being dispatched for it.

Such was the isolation of the province. Its whole trade* was crowded into the six dry months of the year, when carts dragged by unusually small cattle could find their way either to Balasore, 120 miles distant, where there was a small export trade carried on by country craft, or else to the Hooghly, 200 miles distant, whence it was conveyed to Calcutta. That trade, as may be supposed, was perfectly insignificant, and the consequence very apparent in the total absence of any indication of wealth amongst either the merchants or zemindars, while the mass of the people were wretchedly poor.

But little money had up to that time been expended in public works in Orissa. Endeavours had been made to improve the existing lines of embankments; but as the system on which they had been originally designed was very defective, it followed that in such floods as overtook the country in the years 1862 and 1866, the embankments afforded only a limited protection.

Principles to be observed in projecting the works.

The three leading principles to be observed in projecting works for Orissa were thus made clear,—

1st. The country must be provided with means to prevent the recurrence of drought.

2nd. Its harvest must at all times be protected from liability to destruction from floods.

3rd. Lines of communication must be constructed to connect its districts with the sea-board, with one another, with the great market of Calcutta, and with the seat of Government.

The question for consideration then became, How could these several objects be best attained?

Before explaining the measures that were adopted, and the series of works designed to secure these objects, it will be necessary to describe the general features of the country.

CHAPTER II.

General features of the country affected by the scheme.

Between the Chilka Lake and Calcutta, the country is traversed by the seven rivers marginally named,* each of which, with the exception of the Borabullong, is more or less deltaic in character.

* Mahanuddy.
Brahminee.
Byturnee.
Salundee.
Borabullong.
Subunreeka.
Cossye.

The deltas of the four first-named rivers may be said to practically form one great delta, for during extraordinary floods there is almost a continuous sheet of water spread over the whole space from the lake to the Salundee.

The delta of the Subunreeka stretches on the right bank nearly to the Borabullong, as its waters in extraordinary floods have been known to flow nearly as far as that river. On the left bank it merges into the district of Midgellee, whose formation is probably owing to the overflow of the Hooghly and its tributaries. The seventh river, the Cossye, commences to be deltaic immediately after passing the town of Midnapore, but being a comparatively small river the strip of delta or alluvium formed by its overflow is narrow until the Cossye approaches the estuary of the Hooghly, where it assumes the name of the Huldee.

Immediately above the point where these several rivers commence to overflow their banks, the country begins to slope up steeply to the hills. From that point, however, towards the sea the fall is very gentle, varying from $1\frac{1}{2}$ feet per mile in the Mahanuddy to one

* Note.—Previous to the year 1862 there had been a considerable trade in salt from Balasore, but the abolition of the salt manufacture, of course, put an end to this source of trade.

one foot in the Subunreeka and Cossye. Thus the limits within which the works should be confined are clearly marked out. The whole country may be said to be perfectly flat, broken only by such small depressions as carry off the drainage waters to the sea, with the exception of the slightly undulating tract between the Salundee and Borabullong; but even in that portion there is no difficulty in finding a contour line along which a canal might be carried. The soil, as might be supposed, varies a good deal throughout these districts, and partakes of the character of the rocks which compose the basins of the respective rivers, being of a much richer character in some parts than in others; for instance, though the Mahanuddy and Brahminee are contiguous, the fertility of the delta formed by the latter river is far greater than the delta of the Mahanuddy, as evidenced in the enormous growth of the trees and in the weight of the various crops raised. The deposit of the Subunreeka, on the other hand, is apparently not nearly so rich as that of the Cossye.

All these rivers are fed by the rains of the south-west monsoon. The size of their respective basins, and their maximum and minimum discharges are as follows:—

Appendix, No. 12.

Areas of catchment basin and discharge of rivers.

	Catchment Basin in Square Miles.	Maximum Discharge in Flood.	Average Cold Weather Volume.	Minimum Discharge in May and June.
		Cubic Feet per Second.	Cubic Feet per Second.	
Mahanuddy - - - - -	45,000	1,800,000	3,000	750
Brahminee - - - - -	9,000	500,000	1,000	380
Byturnee - - - - -	3,100	200,000	500	180
Salundee - - - - -	250	60,000	260	—
Subunreeka - - - - -	6,000	300,000	600	380
Cossye - - - - -	2,600	143,500	300	180

The staple crop of the whole country is rice, and is grown during the monsoon months. It consists of three kinds:—*First*, That which is sown broadcast, and which in Orissa occupies the greater portion of the land, and is locally termed Beallee. *Secondly*, That which is transplanted, and which, in the absence of the means of artificial irrigation, can only be grown in low grounds, where rain-water is likely to lodge. This crop is known by the name of Sarud, and yields both a finer description and a larger weight of rice. *Thirdly*, That which is grown at the close of the cold weather, or in the spring of the year, and is known as Dalwa. This crop is wholly dependent on artificial irrigation, and, when carefully cultivated, yields a good return.

Crops cultivated in Orissa.

Besides the rice crops there are small quantities of sugar-cane, cotton, tobacco, plantain, chillies, pawn leaf, and other garden produce; but the proportion of such crops in Orissa is insignificant. Wheat is also grown in certain localities, but to no great extent. Cotton, mustard, and other oil seeds form the principal cold weather crops. In Midnapore there is more sugar-cane, and there are also extensive mulberry plantations, but the main crop there also is rice, while in Hidgellee rice alone is attempted to be cultivated.

The principal season of cultivation, therefore, is during the south-west monsoon; and whenever the rains were either deficient or untimely, or if they commenced too late or stopped too early, the great food crop of the whole province was endangered, and could not be replaced in any appreciable degree by any subsequent crop grown in the spring. When the rains cease too early, as, for instance, in 1865, over any large extent of country, the consequence must inevitably be famine, and from the fact that during the late famine money was utterly useless and powerless to procure food, added to the fact that there has never been any export trade from the Orissa districts, with the exception of the small quantities which are shipped at Balasore, the inevitable inference is that the yield off the land is not more than sufficient to sustain the population from year to year, and, therefore, that a partial failure of the harvest must produce a certain degree of pressure locally wherever it occurs. Hence the necessity not only of endeavouring to increase the quantity of food grown off a given area of land, but of so connecting the various districts of the province by lines of cheap water-carriage, that grain may be at once conveyed from the locality where it is to be had in abundance to the place which is in want of it.

The monsoon the principal season for cultivation.

The Godavery and Kistna districts used to suffer in precisely the same manner; but since the net-work of navigable canals has been made, there is scarcely any portion of those districts which is not accessible, and which cannot at once be immediately supplied with food, when, from any unforeseen visitation, the crops in that portion may have either failed or been destroyed.

The rainfall in Orissa not only varies considerably as to the total quantity, but it is very irregular; heavy bursts taking place during, perhaps, a week without any intermission, being succeeded by nearly a month's drought, in which not an inch of rain falls. The average annual fall is considerably in excess of that in the deltas of the Godavery and Kistna; but the irregularity is very similar. This irregularity is fatal to the proper growth

Rainfall.

Appendix, No. 18.

of rice crops, and I have no doubt whatever, is one main cause of the smallness of the yield in Orissa, as compared with that grown in irrigated districts. The rainfall in the Godavery averages, I think, 45 inches. In Orissa it reaches 60 inches. In 1865, the year of failure, nearly 60 inches were registered at Cuttack, but as the rain ceased on the 14th September, the crops consequently perished. The actual quantity of rain falling during the year is therefore no criterion of whether artificial irrigation is necessary or not. It is the regularity or otherwise of its distribution during the cultivating season which has to be observed.

Main object of the scheme.

These considerations determined the *scope* and the *purpose* with which the works were to be primarily designed, as far as their irrigating properties were concerned. The *main object* to be kept in view was to *secure the principal crop* of the district from all risk of failure from drought.

As mentioned above, all the rivers which had to be dealt with take their rise in the chain of the Eastern Ghats, which intercept the south-west monsoon in its passage across the Peninsula, and are consequently abundantly supplied between the months of June and December, or during the season when the main food crop of the country is on the ground. As far, then, as sources of supply, they are individually superabundant for all the land that could possibly be cultivated. The problem then was how could that supply be best distributed? For the elucidation of this point the character of each of the rivers had to be considered separately.

CHAPTER III.

Character of the several rivers. Mahanuddy.

Of all those named, the Mahanuddy ranks the first in size and importance. Its catchment basin above the gorge through which it passes into the delta measures about 45,000 square miles. From its peculiar configuration, the waters which drain off after a heavy burst of rain arrive more or less simultaneously at the main river, and are the cause of the violent floods and of the immense volume of water which is carried in an extreme fresh, and which has been calculated at as much as 1,800,000 cubic feet per second. The discharge during an extraordinary flood in rivers of such magnitude can, however, only be arrived at approximately. If the data on which the above calculation is founded be correct, the great flood in August 1866 was equivalent to nine-tenths of an inch per day over the whole basin for 10 consecutive days, and in the following September, of 1 inch per day for four and a half days.

The flood rarely maintains its *extreme* height for 12 hours; but in the case just mentioned, from the day on which the river commenced to rise to the day on which it subsided again to the same height at which it had before stood, the river had risen through and fallen through 13 feet, during which time it was calculated that the volume of water discharged must have been due to the rainfall above mentioned.

In dealing with the Mahanuddy, a difficulty presented itself at the outset. Immediately upon issuing from the gorge the river bifurcates, one arm retaining the name of Mahanuddy, and the other taking that of Katjooree. From a series of careful investigations which had been made some years previously by Captain J. C. Harris, of the Engineers, it seemed almost certain that the relative sizes of these two rivers had become greatly altered; that the head of the Mahanuddy had become silted, while that of the Katjooree had both so deepened and widened as to take off all the cold weather volume of the river. Captain Harris's investigations further showed that the capacities of all the rivers, so far as the sections within their natural banks were concerned, only admitted of their carrying one-half the volume entering their respective heads, and that, therefore, on the occurrence of every flood above a certain height on the gauges at Cuttack, the country must be, more or less, exposed to the effects of inundation. To meet this difficulty, certain measures have been proposed, one of which was to construct at a particular spot a partial stone dam on the Mahanuddy, which should retard and raise the water in flood, until it had acquired sufficient head to pour down a cutting which it was proposed should at the same time be made from its right bank across the country into a stream which runs into the Chilka Lake. The action of the water on this cutting would, it was supposed, wear it away gradually, until the section was sufficiently large to carry off all the excess water of the Mahanuddy. In other words, the cutting was to serve the purpose of an escape channel for the floods. This project was not approved by the Government; but a proposal made at the same time for diverting the water from the Katjooree into the Mahanuddy by means of a long stone groyne was sanctioned.

This work was a step in the right direction, inasmuch as it commenced to deal with the difficulty at the right points, but it could not of itself, especially as planned, wholly rectify the existing evils. It was plain, however, that the regulation of the rivers must be taken in hand at the outset, and therefore the weir at Naraje (the village situated at the gorge) was planned. For economy's sake it appeared best to make use of the groyne which had been already built, though it was not the best alignment for a weir. To make the work answer the object for which it had been constructed, it was necessary to convert it into a complete weir of such a length and height as should reduce the discharge of the Katjooree to the proportion which it had been calculated the two rivers ought relatively to discharge. Their existing discharges were as 3 : 4, whereas they should be only as 3 : 6. This necessitated reducing the length of the weir to 3,600 feet; but as to raise it to the full height at once was inexpedient, and might, perhaps, endanger its stability at first, the crest of the weir has been kept 3 feet below its ultimate projected height. To make the division between the rivers complete, it was necessary to run an embankment from the head of the delta across the

Katjooree.

the high sands and intervening islands, which were submerged during extraordinary floods, in order to connect the north wing wall of the weir with the protective embankment which surrounds the city; otherwise the waters of the two rivers would mingle and flow from one into the other, and so disturb the equilibrium it was sought to maintain. This work is termed in the estimates the Dividing Embankment. After the weir had been exposed to one year's freshes, it was noticed that there was still a great escape from the Katjooree to the Mahanuddy through the gaps, which had not yet been closed, and therefore it is considered advisable that these gaps should be kept open until the silting up effected by the weir has so reduced the quantity of water passing down the Katjooree that at a given height of the freshes it will no longer flow back into the Mahanuddy. As soon as this takes place, it will be evident that the desired equilibrium has been attained, that the gaps should be closed, and the waters of the two rivers thenceforth be kept separate. The result of the weir has exceeded my anticipations. When I inspected it in May last, I found the bed of the Katjooree on the up-stream side had become silted up far more than I thought possible in so short a time, and also that the diminished volume passing over the weir had lessened the velocity of the river below the weir, so that the lower bed was also filling up. The volume of water passing down the Katjooree and thence down the Pooree rivers must, in consequence, already be considerably lessened.

To protect the Pooree district, entirely, however, it will be necessary to adopt the measures originally proposed by me, viz., regulating the head of each of the rivers below, and forming escapes, or rather taking advantage of the present drainage channels and converting them into escapes for the purpose of carrying off the excess flood-waters. Probably escapes of much smaller section than those I originally contemplated will be necessary, as further investigations have shown that, by regulating the slope of the flood surface, and by giving the existing embankments additional height, the sectional areas of the rivers will be so much increased that they will be able to convey a much larger volume of water than was once supposed. Of these rivers there are four traversing the Pooree district which must be briefly noticed. Opposite to Cuttack the Katjooree divides into two branches, one of which is called the Khoakye. This last, after a distance of 10 miles, throws off from its left bank a branch called the Koosbuddra, which runs through the centre of the tract contained between the Katjooree and the Khoakye. At seven miles further, the Khoakye splits into two branches, called the Bargovee and Dyah. The former runs to near Pooree, and, turning off at right angles to its course, finally disembogues into the Chilka Lake, into which the Dyah also discharges its waters. Both these rivers gradually diminish in section so much that the water entering the head cannot be discharged at the end, and therefore it invariably breaches the embankments somewhere, and finds a vent across the country. On either side the Koosbuddra, which has the character of a deltaic river through the greater part of its course, are two drainage channels, one called the "Prachee," the other the "Dunnoah." Both of these may be made use of as embanked escapes. They actually serve that purpose now, being the natural drainages of the tract in question; so that wherever the floods breach the embankment, the water finds its way to these hollows, and is by their means conveyed to the sea.

Rivers in the Pooree District.

Between the Dyah and Bargovee a similar drainage, called the "Noon," exists, and by taking advantage of this it is probable the freshes entering the head of the Khoakye may be safely disposed of. As the Bargovee and Dyah both run on the ridge, and are, comparatively speaking, of regular section, and by no means tortuous, they can probably be made to serve for the main canals of the district. These particulars, however, will be better entered into when the project of the canals for the Pooree district is submitted.

CHAPTER IV.

Returning to the Mahanuddy, that river will be found to divide into several branches before it finally reaches the sea. The first branch is thrown off just opposite to Cuttack, and is called the Beropa. This has a steeper fall than the parent river, and, after a distance of 35 miles, joins the main stream of the next river, the Brahminee, whose estuary is that fine broad and deep tidal river known as the Dhamra.

The bifurcation of the Mahanuddy and Katjooree, opposite to Cuttack, determined the site for the main anicuts across those rivers; for, had these works been built higher up, the tract of country contained between the branches below the bifurcation could only be supplied with water by means of very expensive aqueducts across those branches. The site for the head works, and the point from whence the canal must be taken off being then determined, the designs of those works had next to be sealed, and these depended principally on the nature of the available material.

Site for the head works.

Fortunately there was abundance of stone and lime procurable. In the immediate neighbourhood of Cuttack there are vast platforms of laterite, and at Naraje, and intermediately, there is an excellent description of sandstone.

As it was ascertained that stone could be deposited at a moderate cost, the form of weir across the River Kistnah was adopted in preference to that on the Godavery, as requiring less skilled labour, and admitting, consequently, of more rapid construction.

Form of weir.

The head works were then planned to consist of three weirs across the Rivers Mahanuddy, Katjooree, and Beropa; but for the Khoakye a set of regulating sluices was proposed. These weirs were 6,400, 3,900, and 1,980 feet respectively. The height of the Mahanuddy and Katjooree weirs was 12½ feet, and of the Beropa 9 feet, exclusive of shutters three feet

Appendix, No. 13. high, which were intended to be added hereafter, whenever the development of irrigation required a greater depth of water to be sent down the canals.

The weir across the Beropa was placed $1\frac{1}{2}$ miles below the point of bifurcation, in order to save that amount of excavation in the High Level and Kendraparah Canals.

The bed of the Mahanuddy and Katjoree consists of pure sand, except for a short distance near either bank, where a stiff clay is found, and which is supposed to underlie the whole space covered by the city of Cuttack.

In the Beropa the bed for a short distance on the left bank consists of laterite not very compact; the rest is pure sand.

Mahanuddy Anicut. The Mahanuddy Anicut was planned to be furnished with three sets of under-sluices, but only two have as yet been constructed. Those on the left bank have been purposely deferred, in order to see what the action on the head of the Beropa would be by allowing the principal draught to be carried down it. The arrangement has thus far proved successful in keeping the head of that river clear.

The under sluices were originally designed on the same principles as those in the southern deltas; but their action has been found so feeble that I determined to experiment with the design of double moveable shutters, which have been successfully used on rivers in France. This year will be the first in which the experiment will have been fairly tried, and, if successful, their adoption in similar situations will be very desirable, as by reason of the powerful scour created by them the accumulations in the bed above the anicuts will be greatly reduced.

The head of the canal which is to supply the tract of country lying between the Mahanuddy and Katjoree, and to which the distinctive term "Central Delta" has been given, is taken off from the right flank of the Mahanuddy Anicut, and a set of regulating sluices is built across the head. The lock, with a separate channel, is constructed at about 400 yards above the sluices.

Junction Canal. From this canal a branch, called the Junction Canal, is intended to be taken close to the principal part of the city, and to be connected with the Katjoree, so as to admit of boats passing from one river to the other, and of carrying their cargoes as near to the merchants' godowns as possible. This canal will be furnished with only a lock on the Katjoree, as head sluices will not be needed.

In the Pooree district it is proposed to use the River Khoakye as the supply channel.

From the Beropa Anicut two canals are led off, one on either bank; that on the left bank is the High Level Canal, intended to connect Cuttack with Calcutta; while that on the right bank is intended for the irrigation of the tract lying between the Mahanuddy, Beropa, and Brahmince. Each of these canals is furnished with regulating sluices and locks.

City Protective Works.

As the level of the ground on which Cuttack is built is below that of the river when in extreme flood, it is necessary to surround the city with embankments. These have been constructed many years, the Mahrattas having in the first instance built a massive revetment of laterite all round the head of the delta. When the anicut came to be built, it was considered necessary that the embankments should be raised and strengthened, and put, as far as human effort could do so, beyond the reach of injury by flood. These embankments are distinguished in the estimate by the name of City Protective Works.

The structures above enumerated include what are termed the head works on the Mahanuddy at Cuttack. A more minute description of their design, dimensions, and other particulars will be given hereafter.

CHAPTER V.

Description of the canals.

The canals have now to be considered. Those intended for the Pooree districts not having as yet been entered upon, will not now be enumerated. Five canals have been designed for the Cuttack district, of which two are branches only from the following three main heads, viz. :—

1. The High Level Canal.
2. Kendraparah - ditto.
3. Taldundah - ditto.

The two last throw off each a main branch to serve for navigation as well as irrigation. That from the Kendraparah canal is called the Pattamoondie branch, and that from the Taldundah canal is called the Machgong branch; both are intended to terminate in tide water.

Kendraparah Canal.

The Kendraparah Canal, which it will be convenient to consider first, takes off from the right flank of the anicut across the Beropa. It is intended to convey water sufficient to irrigate the tract of country contained between the Mahanuddy, Beropa, and Brahmince, and to which the name of the Northern Delta has been given. This tract measures about 700 square miles, and contains about 4,06,000 culturable acres. As almost the whole area is cultivated with rice crops, it was considered desirable to provide sufficient for the simultaneous irrigation of at least two-thirds of it, or for 2,70,000 acres, at the rate of one cubic yard per hour per acre. The dimensions of this canal were regulated accordingly, being planned with a width of 160 feet on the water line, a depth of seven feet, and side slopes of 2 : 1.

That width, however, was only to be maintained as far as the head of the Pattamoondie branch, after which it is reduced to 100 feet, the slope of the bed remaining the same, viz., six

six inches per mile. The width again diminishes in proportion to the quantity of water drawn off by each distributary, until the minimum width of 75 feet is attained. The depth continues the same throughout in full supply, but the fall is reduced first to four inches per mile, then to 1½ inches, and finally to a dead level in the last reach, which ends at a village called Marsaghai, and from whence there is tidal navigation to the anchorage at False Point.

The floor of the head sluices being 50·50 feet above mean sea level, that amount of fall has to be overcome in the length of 40 miles. This is effected by seven locks, inclusive of the tidal lock, so arranged as to maintain a depth of four feet throughout, should the supply of water ever run so short as to necessitate the canal being reduced to a still water navigation.

The general direction of this canal being parallel, and for the most part close to the river bank, its embankments serve the double purpose of tow paths to the canal and flood-banks for the protection of the country; consequently by this one work this tract is both preserved from inundation and supplied with water for irrigation, as well as furnished with the means of conveyance for its produce to the port.

The actual area allotted for irrigation, after deducting that assigned to the Pattamoondce branch, is 1,57,000 acres, of which at present only so much is provided for as lies on the left bank of the Chittertollah and Noona (both minor branches of the parent river, Mahanuddy). The insular portions contained between the right bank of those branches and the left bank of the Mahanuddy Proper, about 50,000 acres, will have to be supplied by means of an aqueduct taken off the main line near the head of the Noona.

For distributing the water to the villages, 13 principal channels with 37 minor branches, are taken off the main canal, and measure in all 171 miles. These distributaries vary in section according to the areas which they have respectively to irrigate. Their direction is shown on the inch-to-the-mile map.

As the canal runs so close to the river, bridge accommodation is only required at those places where roads lead to the different ferries, or where there may be a village between the canal and the river. Besides the bridges at each lock, five intermediate bridges have been provided, thus making 12 crossing places in the length of 40 miles, or on the average one in 3½ miles. For the accommodation of villages, ferry boats are provided, and easy slopes are cut in the banks for the passage of cattle. There being so little land between the river and the canal, scarcely any drainage has to be provided for; six syphon culverts are sufficient to carry off all the rain-water that falls.

The dimensions of the locks were fixed at 100 feet in length by 17 feet in width, in order to admit of the passage of the iron cargo boats, some of which are 80 feet long by 16 feet beam. The country boats which navigate the river vary from 40 to 60, and even 80 feet in length, but are much narrower. As this canal will be the principal route to the port, without doubt a very large traffic will gradually be created, for it bears to Cuttack the same relation that the Coconada Canal bears to the Godavery, and it is therefore necessary to provide accordingly.

The weirs attached to the locks are all designed with a vertical fall, and are made to discharge the full quantity allotted to each, with a depth of four feet on the crest. Planks are fitted into iron grooves, by which the height on the crest, and therefore also upon the sills of the locks in each reach, is arranged. From the terminus of this canal there are two routes to the anchorage in False Point Harbour, one down the rivers Noona and Mahanuddy, and *via* the Bakood Creek, the other by the tidal creek called the Jumboo. This latter route being somewhat shorter, and having a greater depth of water over the bar at its mouth, will no doubt prove ultimately the route which all cargo boats will take, especially during the months when the river is in flood; for at such times the flood tide has no effect on the current of the river, which is so strong that even empty boats find great difficulty in stemming it, whereas along the banks of the Jumboo a towing path can be easily made, and the upward passage of boats be greatly facilitated.

The Pattamoondce branch above mentioned will take off from about the fourth mile from the head of the main canal, and run parallel and close to the right bank first of the Beropa, and then of the Brahminner, into whose estuary it will drop at the village of Pattamoondce. This place is frequented by grain merchants, and is the focus of the little export trade which takes place by the Dhamra. The river here is so large and with such deep water, that in all probability it will become a considerable place of export eventually, for when they are once over the bar, on which there is 16 feet of water at spring tides, ships could ride more safely than in the Hooghly. Whether it may eventually prove advisable to improve the entrance to the Dharma will depend of course on the trade which may spring up, but for the present a steam tug only is wanted to enable vessels to enter and depart safely.

This branch has to irrigate 1,13,000 acres. The original design was to give it the same fall as the country, so as to do away with the necessity for locks; but on reconsideration I think as an alternative line of navigation to another port, which is also connected with False Point by means of tidal creeks, it will be advisable to improve this canal for navigation by the construction of locks, more especially as it also will form part of an alternative line to Calcutta as will be hereafter explained.

The second canal to be described is that to which the name of Taldundah has been given, as that village is the present limit to the tidal navigation, and is the point to which the steamer "Teesta" brings all goods and passengers from the anchorage. The canal, however, has been projected to extend to eight miles further down, and to drop into a sheltered

Irrigable area.

Pattamoondce Branch.

Taldundah Canal.

Appendix, No. 18. tidal creek, for at Taldundah the terminal lock would have to be built on the bank of the main river, and there would be no certainty of deep water being permanently maintained near it. This canal is precisely of the same type as that just described, with the exception that, as it has not to convey so much water, its dimensions are not so large.

The canal head is taken off from the right flank of the Mahanuddy Anicut, and runs for 7 miles, with a fall of 6 inches per mile, a surface width of 96 feet, with side slopes of 2 to 1, and a maximum depth of 8 feet, capable of discharging, if required, 1,460 cubic feet per second. •

Machgong Branch.

At that distance two locks occur, one to regulate the entrance into the branch canal to Machgong, which is here thrown off; the other to the continuation of the main line, which runs more or less parallel with the bank of the river to Taldundah. There are eight locks in its whole length, and the same fall of 59.50 feet to be overcome.

All the masonry works are designed precisely similar to those on the Kendraparah Canal. At the 27th mile, at the village of Jeypore, the canal meets with a small flood escape, which runs right across the central tract from the Katjooree to the Mahanuddy. It will be necessary to close this escape at both ends, and let this natural channel perform its proper office of a drain to the area contained between the two rivers.

The tract which is commanded by this canal and its branch to Machgong, has been designated the Central Delta, and contains 400 square miles, equal to 2,32,000 culturable acres, for two-thirds of which, or 1,55,000 acres, water is provided at the same quantity per acre as on the Kendraparah Canal; for throughout it also rice is the principal crop cultivated. This line will be equally important with the Kendraparah Canal, as far as navigation is concerned, as all the produce of this delta, and probably all that is brought from the Pooore and southern districts, will find its way along it to the port. It is very important also to have two lines of communication to the port, as thereby it will be always possible to close one for repairs without much inconvenience to the public; and in the case of any unforeseen accidents to one, the other will be always available. When once an important trade has been established, it is most essential to avoid all risk of the line of communication being wholly interrupted.

The Machgong branch was planned more especially with a view to affording irrigation. It will during the cultivating season serve the purposes of navigation; but as there is no important place at its terminus, and the estuary of the River Daib, into which it falls, is visited by only a few country vessels occasionally, a line of canal navigable throughout the year is not of so much importance, and therefore no locks have been designed for it for the present.

The dimensions given to this canal are 60 feet on the water line, with a depth of 6 feet in full supply, and a fall of $1\frac{1}{4}$ feet per mile. It has to supply with irrigation an area of 82,000 acres. As both these canals run more or less near the river's margin, their embankments will likewise help in affording protection to the country from inundation.

The distributaries from both these canals are to be arranged similarly to those from the Kendraparah Canal, and the natural drainage of the country wherever defective will be improved. As on the Kendraparah Canal, so here the amount of drainage *intercepted* is very small, and will be provided for by 10 syphon culverts in each canal.

High Level Canal.

It now remains to describe the High Level Canal. This work differs essentially in design from those just described. Its importance as a continuous line of first class navigation connecting Cuttack and all parts of Orissa with Calcutta is equal, if not greater than the irrigation which it will simultaneously afford. Its power as an irrigating canal is confined to a small area in comparison with its length, as it is necessary for so important a line of navigation, where there will be so much traffic proceeding both ways, that the velocity should be kept as low as possible, consistent with other conditions. With a low velocity of course the discharge must be proportionately small, unless the canal be made of great width.

Dimensions

The dimensions given in the present instance are 120 feet on the water line, with a maximum depth of 8 feet, side slopes of 3 to 1, and a fall of only one inch per mile. The mean velocity with these dimensions amounts to only $\frac{9}{16}$ of a foot per second, and the surface velocity to about 1,100 yards, or $\frac{3}{4}$ of a mile per hour. This velocity has, if I recollect rightly, been found in the Godavery sufficient to check the growth of weeds, and is at the same time of but little obstruction to navigation. On this long line of navigation, where the obstruction from lockage will be trifling, I have little doubt but that it will be found profitable to run passenger steamers as well as to use steam power for towing. The capacity of this canal in full supply will be 705 cubic feet per second, sufficient at the same rate of calculation in round numbers for 90,000 acres.

As the direction of this canal lies across the drainage of the country, its construction might, at first sight, appear to be accompanied with considerable difficulties, especially as some formidable rivers have to be passed before Calcutta is reached; but the very fact of the principal part of that drainage being concentrated in those rivers facilitates the construction of the canal, and affords the means of its proving more remunerative than it would otherwise be; for, as each of these rivers afford a *fresh source* of supply, the canal is divided into as many sections as there are rivers to be crossed, and thus, instead of its being only able to convey 700 cubic feet per second along its *whole* length, it can be made to convey an equal volume along *each section* of its length, and so its irrigating capacity is, of course, increased in proportion to the number of its sources of supply.

General description.

Before considering each section in detail, it will be well to give a short general description of the course it takes. Starting from the left bank of the Beropa it follows the high ground

ground which skirts the edge of the delta, until it reaches the River Brahminee, the bed of which is there 8 feet lower than that of the Mahanuddy. The Brahminee, which here bifurcates, is spanned by two anicuts, one across each branch at the apex of its delta. The canal starts again from the left bank, receiving its supply from the Brahminee, and similarly skirts the edge of the delta land as far as the River Byturnee, which in its turn is spanned by two anicuts at the point of its bifurcation. The canal is then continued from the left bank, receiving its supply from the Byturnee, and runs more or less parallel with the Trunk-road to the river Salundee, which likewise will be most conveniently crossed by an anicut. From this river the canal will follow a contour line, crossing and re-crossing the Trunk-road until it reaches the town of Balasore, below which it will be dropped by locks into the Balasore river.

For its continuation from thence a new summit level and source of supply is found in the River Subunreeka, across which another anicut has to be built, from either flank of which the canals to Balasore and Midnapore are respectively led off. The levels do not admit of the canal from the Subunreeka being taken to Midnapore itself, so it joins that portion of the canal which takes its supply from the Cossye at about 10 miles below that town.

The canal from Midnapore is fed by the Cossye, across which an anicut is thrown, and runs straight to the Hooghly at Oolobarria. The Cossye has to be recrossed at Panchkoorah, where a second dam is built, which supplies the next reach as far as the Roopnarin, from whence the two remaining reaches are tidal. The total length from Cuttack is about 250 miles.

To proceed now with the different sections in detail, the first section, 32 miles in length, starts, as has been said, from the left flank of the Beropa anicut, and proceeds generally in about 6 feet of cutting, until it reaches the 10th mile, where, in order to avoid a very sharp curve and high embankments, it is obliged to be carried across the spur of a hill in a cutting 20 feet deep through very hard laterite studded with sandstone boulders. Again, at the 12th mile it meets with the saddle of a hill about $\frac{3}{4}$ of a mile in length, with an equal amount of cutting, after which it winds round the base of the great "Durpan" Hill in alternate embankment and cutting, until it reaches the village of "Nealpole" close to the Trunk-road. From that point, the contour edges away up the valley of the Brahminee until it arrives at the place where the river bifurcates at the head of its own delta. 1st Section.

The bed of the Brahminee being eight feet below that of the Mahanuddy, a lock is required in the canal before reaching the Brahminee, in order to adjust it to the level of that river's bed. The best position for that lock was found to be at the twenty-seventh mile, where the large drainage nullah is crossed near "Emannuggur," about four miles beyond Nealpole; and on reaching the Brahminee the canal mouth has to be protected by a guard lock, in order to keep the high freshes of that river from entering the canal.

The drainage works in this section, consisting of 11 syphon culverts and four waste weirs, provide for the discharge of nine inches of rainfall in 24 hours. The whole area of intercepted drainage amounts to only 216 square miles. The principal culvert is that situated in the first mile, by which the hill stream called the Gondo Noi is passed. It consists of six vents, with an aggregate area of 660 square feet. The general plan is that of a well into which the water falls over a retaining wall on to a substantial flooring, and passing through the arches is discharged over a similar wall on the lower side. The breadth of the whole chamber is from 112 to 116 feet. All the culverts are on a similar plan, and vary only in size suited to the duty which they have respectively to perform.

The waste weirs are on the ordinary design of a vertical drop wall and paved apron. In one case the weir is cut out of the solid rock at the end of the first cutting near the village of Santipore. The lip of the weir is placed at five feet above the bed of the canal; the additional three feet of water will be retained by shutters. Where the canal skirts the Brahminee, the right bank has to perform the office of a river embankment against the floods of that river, which for reasons hereafter shown must also be embanked for a length of 10 miles above the junction.

Including the bridges over the head and terminal and intermediate locks, there are 13 bridges provided for in this section. In addition to the bridges, there are long slopes and ghats provided as cattle crossings and ferry boats at such villages as may require them. The bridge for carrying the trunk road across the canal consists of three openings spanned by a continuous iron lattice girder, the width of the roadway being 21 feet.

The irrigable area commanded by this section of the canal amounts to 89,000 acres, included in an area of about 150 square miles. The water will be distributed by 17 channels of varying capacity, and an aggregate length of 113 miles, the width of water surface in which will vary from 10 to 26 feet, the depth from 2 to 4 feet, and the fall from .5 to 1.5 feet per mile. The first of these distributaries, which has to convey water for 26,000 acres, runs for nearly 10 miles along the margin of the River Beropa, and one of its banks has to be made of sufficient section to serve the purpose of the river-flood embankment. At the tenth mile it has to be carried across a small branch of the Beropa, called the Gungooter; and the only way in which this can be effected is by an iron syphon pipe laid on the level of the bed of the river. This arrangement adds considerably to the expense of this distributary, as it is estimated to cost 54,700 rupees. Excluding this item, the detailed estimate for all the distributaries, amounting to 1,81,500 rupees, averages about two rupees per acre.

The Brahminee is a large river, draining a catchment basin of about 9,000 square miles. Its flood-discharge amounts to 500,000 cubic feet per second, and its volume does not diminish below 1,000 cubic feet until the month of May, when it is reduced to 380 cubic

Appendix, No. 13. feet per second; but it is frequently augmented by the heavy north-west storms which occur in the hills at that period of the year. Just above its bifurcation the Brahminee is nearly a mile wide. Of the two branches into which it divides, the larger, measuring 4,000 feet, retains the name of the main river, while the smaller branch, which is only 900 feet broad, is called at the head the Pattia, and a few miles lower down is better known as the Kursoca. An anicut, eight feet high, is designed to span this river into two branches, and the water held up by it feeds the second section of the High Level Canal, as also the tract of land inclosed between the two rivers from the bifurcation to their junction again after a length of 50 miles.

Design of weir.

This weir is designed on the same model as that across the Mahanuddy, there being abundance of stone available at from two to three miles distant. The Brahminee overflows its right bank from a point about 10 miles above the site of the weir. This overflow, which is very considerable, accumulates on the low ground at the base of the hills which skirt this river as far as the Trunk-road crossing, and finds its way back again when the river floods subside through the drainage nullah at Emannuggur just mentioned. The result of the river having been thus left to itself is, that its bed has become *greatly* silted, a disproportionate quantity of water has been forced down the Pattia, or, as better known, the Kursoca, the consequence of which is felt in the bursting of the embankment in its lower reaches. On the left bank the high ground is near the river, and so there is but little spill above the site of the weir, though there is a great deal *below* it. The first thing necessary is to regulate the discharge of the two rivers, which will, as in the case of the Mahanuddy, be done by the weirs, and by embanking the right bank from above as far down as the flank of the weir. Below that work it will also be necessary to carry the embankment down to the Trunk-road on either side. Beyond the road embankments already exist. The same course must be followed on the other branch, the Kursoca. This tract of country, which has hitherto been periodically overwhelmed, will thus be thoroughly protected, and the Delta proper of the Brahminee be also eventually supplied with water. It contains some of the richest land in Orissa, measuring about 180 square miles, or about 100,000 acres of cultivation; but at the same time it is, perhaps, as much exposed as any part to most destructive inundations from the Brahminee, simply for want of a little judicious regulation of its waters.

2nd Section.

From the left bank of the Pattia, the second section of the High Level Canal is taken off with the same capacity as the first section, and runs for about 13 miles as far as the River Byturnee. The triangle of land inclosed between the Kursoca and the Byturnee, and irrigable directly by this section of the canal, contains about 50 square miles, or about 30,000 cultivated acres; but as the area between the two branches of the Byturnee, measuring 250 square miles, or 145,000 acres, of which two-thirds, or nearly 100,000 acres, may eventually require irrigation, is larger than the available water in that river during the cold weather can supply, this section of the canal will have to convey a portion of the water from the Brahminee to supply the deficiency, and therefore it has been designed with dimensions equal to those of the first section. The anicut across the Pattia branch of the Brahminee has been placed lower down from the point of bifurcation than that across the main branch, in order to avoid the expense of crossing the Gind Nuddee. The level of the surface in the river when in flood being higher than of the water in the canal, it was not possible to let the water of the Gind Nuddee into the canal and over a waste weir out again into the river; while to carry the nullah under the canal by a syphon aqueduct would, owing to the relative levels of the water in the river during floods, and in the canal and in the nullah itself, entail a difficult and costly work. The drainage area of the Gind Nuddee being about 140 square miles, it would require a discharge of about 34,000 cubic feet per second to carry nine inches of water off the ground in 24 hours, or a waterway to the extent of 3,400 square feet, a velocity of 10 feet per second.

As the river when in flood stands up the Gind Nuddee and forms a large swamp, the water of which partly drains off towards the line across which the canal will run, it is necessary to embank the left bank of that nullah, so as to force the river floods to return by the way which they entered.

Head sluices, and a lock similar in design to those built for the 1st section, are, of course, required at the off-takes of this section, and at its terminus or junction with the Byturnee, &c.

At its junction with the Byturnee, the lock will have to be furnished with an extra pair of gates, in order to exclude the high floods of that river, and prevent their standing back up the canal. At other times the lock would remain open, unless it should ever be necessary to reduce this reach to still water, in order to provide for which contingency the banks of the canal in this, as well as in all the other sections, are arranged accordingly.

In order to pass off the drainage which is met with in this length of the canal, two syphon culverts and three aqueducts are required. The former consists of two vents of 12 feet span, with self-acting shutters; the latter, though of similar design, differ in dimensions according to the amount of water which has to be passed. Those over the Tendurah and Roryah Nullahs consist of eight vents of 15 feet span each. The Noontikree Nullah requires one of 10 vents of 15 feet. The area off which the drainage has to be passed by these works amounts to about 80 square miles. The character of the soil along this section is clay, which, during the dry months of the year, bakes into a very hard substance, and is consequently more difficult to excavate than the ordinary delta soil. A higher rate has accordingly to be provided in the estimates.

Besides

Besides those at the head and terminal locks, two bridges are provided in this length,—one of masonry, consisting of two arches of 30 feet span, to carry the Trunk Road over the canal; the other of timber, similar to those which have already been constructed on the 1st section. Appendix, No. 13,

The irrigation from this section of the canal will be very simple, as the area to be supplied is comparatively small. The irrigation of the tract inclosed between the two rivers above alluded to will have to be taken direct from the river through separate head sluices on the left flank of the anicut, across the main branch. Detailed estimates have been made for the distributaries.

The river Byturnee, which furnishes the supply to the 3rd section of the High Level Canal, is subjected to the most violent floods. The catchment basin, measuring 3,100 square miles, appears to be exposed to very heavy storms of rain, and its valley above the village of Amboh, which is situated in a gorge, has been described to be at times completely submerged with water. It is certain that the whole of the drainage of its basin does not find its way by the bed of the Byturnee, but that, headed back by the contraction at the gorge at Amboh, a large volume of the flood escapes over a saddle to the north of that village, and, spreading over the country, crosses the Trunk Road near the village of Barriepore, by the Roboo Nullah, a large drainage stream which ultimately finds its way into the Byturnee again, near its confluence with the estuary of the Brahminee. The Byturnee.

The floods which proceed down the river itself, and which are calculated to amount to 200,000 cubic feet per second, overtop the banks at about 10 to 12 miles above the Trunk Road crossing, and occasion much mischief on the left bank especially. Embankments must therefore be constructed to prevent this overflow down to the point where the river bifurcates below the village of Aquapudda, and where weirs have to be built across the two branches. These weirs I should now propose to build of masonry for only five feet of the full height, and to obtain the rest by means of shutters, either self-acting, or after the model of those lately made at Cuttack, as by so doing both less building materials will be required, and less obstruction offered to the passage of the floods. As there is no stone available near the Byturnee, and as all that is required will probably have to be conveyed from the quarries at the Brahminee, 15 miles distant, it is preferable to adopt a design which will require the least quantity of such material. The original design for this work was a weir with a vertical drop, but I am of opinion it will be better to modify the original plans, as above described.

The 3rd section of the canal will thus be taken off from the left bank of the Byturnee, and also run more or less parallel with the Trunk Road, as far as the next river, the "Salundee," across which, being provided with a similar set of sluices and lock, it will be carried by a weir near the town of Bhuddruak. 3rd Section.

Drainage has to be provided for in this length of canal for an area of about 190 square miles, in addition to the overflow from the Byturnee at Amboh above mentioned. For this purpose, the following aqueducts have been designed:—The first, over the Jummoo Nullah, consisting of 10 arches of 15 feet span; the second, over the Kopali, of 30 arches of 20 feet span; the third, over a branch of the Kopali, with 10 arches of 15 feet; and the fourth, over the Roboo, with 20 arches of 20 feet span. Besides these, a waste weir, 50 feet long, is provided to pass off surplus water near the terminus of the section. The spill water, which finds its way over the saddle at Amboh, spreads over the country, and it is difficult to say by which of the nullahs above mentioned it is discharged, neither is it possible to calculate the exact volume: but, as well as could be judged from the information obtainable on the spot, I reckoned that it must be about 15,000 cubic feet per second. Such a flood, however, never lasts more than 24 hours. The quantity of drainage running off an area of 190 square miles, at the same rate as before allowed for, would amount to 42,170 cubic feet per second, to which, if 15,000 be added, the total volume to be discharged would be 57,170 cubic feet. The waterway provided in the aqueducts above mentioned amounts to 7,000 square feet.

In this section, besides those at the head and terminal locks, six bridges have been provided, one of which only is of masonry, to carry the Trunk Road over the canal; the others are timber bridges, as before described.

The lock at the terminus will have to be provided with an extra pair of gates for keeping out the waters of the Salundee when that river rises above the canal level.

The area contained between the Byturnee and Salundee capable of irrigation is considerable, measuring 250 square miles, or about 145,000 acres of cultivated land. Most of this will have to be supplied, during the season of rice cultivation, by a separate channel led off from the point of bifurcation, and independent of the High Level Canal. The average discharge during the monsoon is superabundant during the cold weather; the volume does not fall below 500 cubic feet per second; but, in the dry months, this is reduced to about 180 cubic feet, and it is often replenished by the heavy storms which prevail in the surrounding hills. The lines for the distribution channels have not been surveyed in detail as yet. It is also at present much exposed to inundation for want of a proper system of embankments, though the existing lines have, within the last two years, been improved.

The Salundee, from which the 4th section of this canal is taken off, is a much smaller river than any of the others previously described, having a catchment basin of only 250 square miles. During the monsoon, i.e., from June till the end of October, it is supplied with more water than the High Level Canal could ever take off. After that month, how- The Salundee.

Appendix, No. 13. ever, the supply begins to diminish rapidly, and, in the dry months, the canal must be fed from the Byturnee and Brahminee combined.

From the Salundee two lines of canal have been projected,—one to maintain a high level, running on the same rate of inclination, and following the configuration of the ground as far as the town of Balasore, where it will be dropped by a flight of locks into the tidal river below the town; the other to be taken direct towards the coast, till it reaches the tidal river “Metaie,” into which it will be dropped by a flight of locks at the village of Rokanaidpore, from whence it is to be carried parallel to the coast as a tidal canal, and be locked up to high spring-tide level.

4th Section.

The upper line which forms the 4th section will have to be carried by an aqueduct over the river Kansbans, which is met with about half way between the Salundee and Balasore. Its catchment basin measures about 220 square miles, and its waters are carried under the Trunk Road by two large bridges, the waterway in which is a gauge of its floods. For the monsoon crop a full supply will be obtainable from the Salundee, but there is not sufficient water to irrigate any cold weather crop. The length of this section is about 58 miles, and the area commanded by this section is about 460 square miles, equal to 230,000 acres, for two-thirds of which irrigation may be provided, or for say 153,000 acres.

The line of this canal has all been surveyed and levelled, but the estimates for the masonry works have not been prepared in detail.

The quantity requisite to supply the evaporation over this length of canal during the hot months will be about 40 cubic feet per second, while the lockage at the rate of 100 locks full per 24 hours will require about 40 cubic feet more, so that allowing half as much more for wastage, 100 cubic feet per second will be sufficient for this canal for all purposes of navigation. The Brahminee carries about 400 cubic feet, and the Byturnee somewhat under 200 cubic feet per second, so that there is plenty of water to spare for the maintenance of navigation along the whole distance. Supposing, however, that it were found either requisite or desirable to expend that supply in irrigation instead, then the navigation could be maintained during those months by the lower or coast line.

The double line of canals was projected for two reasons,—first, because the coast line running on the lowest level, and requiring no large drainage works, as well from the softer nature of the soil, can be more quickly and economically constructed; and secondly, because on a great line of traffic, such as this is sure to become, it is most desirable that there should be always an alternative line, so as in the event of any accident happening to the one the traffic may yet proceed without intermission along the other. This arrangement is rendered all the more feasible in this scheme from the presence of so many tidal rivers in Orissa; for, when this connecting link to Balasore has been once made, it will be quite possible to close any of the other canals at any time, and yet keep the through communication uninterrupted. The River “Metaie” is, notwithstanding its name, a tidal river of large dimension, navigable for sea-going craft almost up to Rokanaidpore. From its junction with the Brahminee, or rather its estuary, the Dhamra, boats can proceed by open tidal nullahs either across to the Mahanuddy, or to the termini of the Pattamondee and Kendraparah Canals, and thus reach Cuttack. In fact, the coast line, if the existing natural channels are connected by artificial cuts such as that proposed, would form as it were a grand junction canal connecting the ends of all the other canals, and consequently enable the communication from Cuttack to Calcutta to be maintained uninterruptedly.

5th Section

The Subunreeka.

After reaching Balasore, it becomes necessary to look for a new source of supply for the next or 5th section of the High Level Canal. This is found in the Subunreeka, a river which has a catchment basin of 6,000 square miles, a discharge of about 300,000 cubic feet per second in the flood season, and of not less than 380 cubic feet per second during the dry months. After careful examination and survey of the river, it was decided to fix the site of the weir at a spot where about 2,000 feet of width could be obtained, near the village of Totaparra. At this point the spill itself is reduced to a minimum on both banks; while, on the right bank, a laterite quarry exists. Not far from this place and situated about four miles in the jungle are two old forts of very considerable dimensions, the walls of one of which are revetted with blocks of hewn laterite. The fort is deserted, and the ownership, I believe, unknown. At all events the stone could be purchased for a small sum, so that a tramway laid from it to the site of the weir would supply, probably, more stone than will be required for all the canal as well as for the head works. The Subunreeka has a fall varying from $1\frac{1}{4}$ to 1 foot per mile; its bed consists of very fine sand, and the extreme flood rise is about 20 feet. As during the rains it carries a large body of water, and as its dry weather volume is also very considerable, it is particularly fitted to form a source of supply for the two portions of the High Level Canal to the north and south of it. After both these lines had been carefully surveyed, it was found that the south canal would just skirt the edge of the cultivated land which marks the boundary of the Mohurbunj Tributary Mehal, and fall into the river at Balasore, opposite to the terminus of the canal from Cuttack.

There are only two drainage streams of any magnitude that have to be crossed in this portion. One, the Jammira Nuddee, has a catchment basin of 525 square miles; the other, the Numma Bans Nuddee, drains 92 square miles. The remainder are all of small dimensions.

The area of land commanded by the 5th section amounts to 180 square miles, or about 90,000 culturable acres. Much of this land has been exposed to almost annual inundations, and consequently a good deal of it lies waste, and the population per square mile must be less than most parts of Orissa. But there is a number of large villages scattered along it,

and

and the land itself yields good crops of rice. In the year 1865, however, there was scarcely a blade of grass to be seen throughout the whole tract. Appendix, No. 18.

From the left bank of the Subunreeka the 6th section of the canal will have to be taken off in cutting for the first few miles, after which it can follow the requisite level to its junction with the Midnapore Canal near Debra, about 10 miles from Midnapore. The levels do not admit of its being carried to that town itself. In its course it has to cross four large drainage streams, one of which, the Kalleaghye, drains about 300 square miles. As all these drains are spanned by bridges on the Trunk-road, which have been built for many years, the amount of waterway required for the canal aqueducts can, of course, be accurately calculated. 6th Section.

At the 17th mile it is proposed to throw off a branch canal, which shall likewise carry water for irrigation, but which will be especially intended to connect the High Level Canal with the tidal navigation at the head of the Russoolpore river. Branch Junction Canal.

The total area for which irrigation is provided by this section of the High Level Canal is 200,000 acres. The main crop here is also rice, and hitherto there has been but very little attempt at cultivating cold weather or spring crops. The country is thickly populated, and there are villages of considerable size scattered throughout it. As labour, however, has not been plentiful hitherto on the road works, it is probable higher rates may have to be given. The estimate of this portion was therefore framed somewhat higher than for the other sections. The total amount estimated by the Irrigation Company's officers was 38 lakhs, but this included 5½ lakhs for establishment, and a nearly equal sum for the head works. The distributaries and sluices are estimated at 4,90,000 rupees more, so that the cost of the canal itself, with contingencies, amounts to about 22,60,000 rupees for 83 miles, or about 27,000 rupees per mile. The cost of the whole scheme, however, even as estimated by the Irrigation Company, would, for 245,000 acres, be at the rate of 15·5 rupees per acre.

The last or 7th section of the High Level Canal is that between the town of Midnapore and the Hooghly, at Oolooharia. For the first 25 miles of its length it is fed from the River Cossye, across which a weir has been thrown, and the canal led off from the right bank along the ridge which lies between the valley of the Cossye and the feeders of the Kalleaghye. As almost the whole difference of level between the bed of the Cossye at Midnapore and tide water at Oolooharia has to be overcome in these 25 miles, there are as many as six locks in that distance, the last one of which drops the canal into the branch of the Cossye, which flows past the village of Panchkoora. This branch is only 330 feet broad, but as the flood level rises three feet above the natural banks, it would have been difficult to pass the river by an aqueduct, and therefore it was determined to build a dam composed partly of masonry and partly of self-acting shutters, by means of which not only could water from the canal be passed across the river, but also the small supply which is available during nearly the whole of the dry season be intercepted and diverted down the next portion of the canal which reaches to the Roopnarain. This reach commands about 50,000 acres, and it was here that lands were first irrigated from the canals, and where probably a considerable extension will hereafter take place. A lock on the left bank will admit boats from the river into this reach, and a lock at the end of it passes them out into the Roopnarain. From thence that river takes up the navigation for about four miles, when at the village of Kantapokur, the next reach, only about four miles in length, connects the Roopnarain with the Damoodah by an open cut, and from the Damoodah the terminal section to Oolooharia completes the navigation to the Hooghly. In this section locks have been built at either end, which maintain the canal to the level of high water, so that boats can navigate it at any time of tide. 7th Section.

The river Cossye has a catchment basin of 2,600 square miles; its extreme flood discharge amounts to about 143,500 cubic feet per second, while its minimum discharge has not fallen below 190 cubic feet per second. Consequently, for the main crop, which consists almost entirely of rice, there is a superabundant supply, while the minimum discharge is more than sufficient to meet all the requirements of navigation. The locks are so arranged that there shall be a depth of five feet throughout should it ever be necessary to reduce the canal to still water. The dimensions have been fixed at 80 feet width on the water line in cutting, and 120 feet in embankment, with side slopes of two to one, a maximum depth of eight feet, with a fall of four inches per mile, making its discharging capacity equal to 930 cubic feet per second, or sufficient for about 120,000 acres of rice. The Cossye.

There is but little local drainage to provide for, for the first 17 miles. At that distance, however, a low hollow occurs along which the spill water of the Cossye in high tides passes after crossing the Trunk-road. The best method of disposing of this spill water, which is calculated to be as much as 50,000 cubic feet per second, is to pass it under the canal, and for this purpose an aqueduct of 20 arches of 10 feet span was originally designed. The freshes of last year, which reached a higher point than was ever before known, has shown that it will be necessary to provide additional vent for this water. It is not necessary to provide for the discharge of 50,000 cubic feet per second, as the river only overflows its bank for about 12 hours, and the water does not even now drain off the country under four days, as the fall is so small. To allow the water to pass off at the same rate as at present will require 30 arches of 10 feet, with a velocity of eight feet per second.

Beyond the Cossye in the reach between it and the Roopnarain the great portion of the drainage is taken under the canal near the village of Siddha by a large syphon culvert with self-acting shutters capable of discharging 1,200 cubic feet per second which has to per-

Appendix, No. 13. form the double duty of keeping out the salt water in the dry months, and discharging the surplus fresh water in the rains. The rest of the drainage runs parallel to the canal, and is carried by the Dainan Khall into the Roopnarain. In the two tidal reaches connecting the Roopnarain with the Hooghly, sluices are provided on the canal banks to admit of the local drainage being passed into it, but it will be better eventually to lead it away from the canal to the nearest outfall.

Seventeen distribution channels, with an aggregate length of about 140 miles, have been designed for this canal, 12 of which irrigate the area between Midnapore and Panchkoorah, and five the land between the latter place and the Roopnarain. The water of the Cossye is held by the cultivators in much esteem for the fertilizing deposit which it carries in large quantities during the rains.

As a line of navigation from its proximity to Calcutta, and by collecting the traffic of the intervening rivers, it becomes the most important of all the sections. There is little doubt but that the receipts from tolls alone will eventually pay the interest on its cost.

Tidal Canal.

This completes the description of the High Level Canal. There remains yet one more work to be mentioned, and that is the Tidal Canal, which commences at Banka, about four miles above the junction of the Roopnarain with the Hooghly, and extends at present to Kalinuggur on the Russoolpore. The first section of this canal was originally a small work belonging to the Government, intended principally for the salt trade. It was merely an open cut, 45 feet wide at the surface, and navigable only at high spring tides. By it boats used to pass into the Huldee, and so up the Cossye to Midnapore, during the rains. When the company projected the Tidal Canal, this section of it was made over to them by the Government. Its dimensions have been increased to 90 feet on the water line, and a lock projected for either end for the purpose of maintaining the canal always full, so that boats may navigate at all times of tide. As long as it remained an open cut, it invariably silted up several feet every year at the place where the tides met, and so cost large sums for clearance. One lock only has as yet been constructed, but the action of this has been beneficial, inasmuch as the tide having only one means of exit, a scour has been created at ebb tides, and thereby the deposit of silt has been considerably reduced.

By continuing the canal from the Huldee to the Russoolpore, a safe communication has been opened from Calcutta to the village of Ballighai, the principal grain mart of the Hidgellee district. As soon as the southerly winds set in at the beginning of March, the navigation of the Hooghly in the reaches below the Roopnarain becomes dangerous for country craft, so that communication with the districts on its borders may be said to be practically cut off for eight months of the year. The construction of this inland canal at once affords a safe passage to boats, besides shortening the distance by one-half of the river route, or from 60 to 30 miles.

It was originally intended to extend this canal to Balasore; but when the Subunreeka works were projected, and it was found that the canal from that river to Balasore must necessarily run not far from the coast, it seemed better to postpone the continuation of the tidal line. I have little doubt, however, that it will eventually be found desirable, in order to complete the system of alternative lines, and to guard against any possible interruption to the traffic, to finish the coast line as originally contemplated.

When the locks, which are 150 feet long by 20 feet wide, are finished on this canal, so that it can be always kept full to high-water level, it will afford a first-class navigation, 90 feet wide at the surface, and never less than eight feet in depth. There is already a considerable traffic to and from Calcutta to the southern districts; and with the increased facilities which this canal will afford, combined with the trade which its eventual connection with the valley of the Subunreeka will induce, there is every prospect of this portion of the project yielding a good return on the outlay. This completes the system of works projected for the province of Orissa, and they will, when fully carried out, not only protect its main food crop from the risk of perishing from drought, but by furnishing it with cheap means of transit, and by bringing it into communication with other districts, both north and south, and rendering it accessible from the sea-board, give such an impetus to its trade as it has never yet known.

CHAPTER VI.

Navigation of Upper Mahanuddy.

There is, however, one more side from which it is as yet only partially accessible, and that is from the west. Although the river Mahanuddy is navigable for the greater part of the year, yet from a point 100 miles above Cuttack its bed is so encumbered with rocks as to make navigation at certain stages of the river very perilous. This circumstance, has, however, served to call forth a class of boatmen who, perhaps, are unequalled in skill in managing a boat through such surging rapids as have to be encountered. The boats themselves, one would suppose, were most difficult to manage, where the passages are not only narrow but sometimes tortuous, for they are nearly 100 feet in length, and about six feet broad, with a long entrance and run, and perfectly flat-bottomed and wall-sided. They seldom exceed three feet in depth, and when fully laden draw, at the outside, two feet, generally less. When empty their draft is less than six inches. There are seldom more than four men on board each boat, two of whom stand at the bow with a strong bamboo up-lifted, ready for the emergency. The other two are at the helm, which consists of a long sweep generally out of the water. With one vigorous stroke of this oar they will nearly turn their long boat at right angles to the current, and with another stroke bring it back

back again to its original course. Notwithstanding the difficulties to be encountered, there is a very considerable trade down the river from Sumbulpore and Chutteesghur, of which cotton forms an important item. Appendix, No. 13.

Sir Richard Temple, when Chief Commissioner of the Central Provinces, was urgent for the improvement of this communication, and surveys were made at the outset of the company's operations to ascertain the feasibility of constructing a canal parallel to the river, so as to avoid entirely the rocky obstacles in the bed. For this canal it would be necessary to build a dam across the Mahanuddy as high up as Puddumpore, 30 miles above Sumbulpore, where there is a rocky barrier right across the river. A canal taken from thence would skirt the margin of the river more or less all the way down to Dholepore, and fall into the Mahanuddy again not far above the mountain gorge through which that river flows, and which is known as the Burmool Pass. All the necessary particulars for framing an estimate for this work were collected by Mr. Walker, the present superintending engineer of the Orissa Circle, who is likewise acquainted with nearly the whole basin of the Mahanuddy, having explored every one of its principal tributaries. Recommended by
Chief Commissioner,
Central Provinces.

In connection with this project investigations were made into the possibility of constructing reservoirs on the several feeders of the Mahanuddy, primarily with the view, by a system of storage, to regulate the floods, and moderate their violence in the delta. The examination was carried out very minutely, and resulted in establishing the fact that sites more or less favourable existed on all the tributaries, Tel, Ebe, Husdoo, Jonk, and Tedi Maun. The sites of the two first were surveyed in detail, and estimates framed. The contents of these reservoirs would be 40,000 and 32,000 millions cubic feet respectively, or 72,000 millions combined. If this volume were kept out of the Mahanuddy for 24 hours it would be equivalent to reducing the discharge of that river by 833,333 cubic feet per second, leaving 966,667 cubic feet, or just about what the rivers are calculated to discharge within their natural banks at a distance of 25 miles from the head of the delta. Supposing the reservoirs were constructed, the actual result in practice might possibly not be as above, but the calculation is sufficient to show what an aid such reservoirs would prove in moderating and retarding the floods, to say nothing of the additional supply they would afford to the river in the summer months, thereby improving its navigation over the existing shoals, as well as being available afterwards for distribution through the delta canals. Reservoirs on
feeders of Maha-
nuddy.

The reservoir on the Ebe would command a large part of the Sumbulpore district, which is Government territory, and prove very valuable for irrigation. The reservoir on the Tel would be situated in one of the Gurjat or independent Hill States. It also would command a large area for irrigation; but as the population in that part of the country is sparse and poor, little or no revenue could be expected from the neighbourhood; but the water would be very valuable in the delta, to which of course it would be allowed to flow, and by its volume would increase the depth over the intervening shoals in the river, and so, as above stated, improve its capability for being navigated during the summer months.

It is not to be understood from what has been said above that reservoirs are absolutely indispensable for regulating the floods of the Mahanuddy, which I believe can be otherwise effectually dealt with, and which will form the subject of a separate report; but such works have always appeared to me to be a more reasonable way of managing surplus water in a country (where water is more valuable than almost anything else) than the usual method of allowing it to be carried off to the ocean, and so lost for ever. That there are difficulties in the way of constructing works of magnitude in out-of-the-way places must needs be admitted; but it is the business of the engineer to overcome such difficulties, and the longer we abstain from grappling with those difficulties the more formidable will they appear.

CHAPTER VII.

The extent and purposes of the several portions of the works comprised in the Orissa scheme having been described, it remains to state their probable cost, and to consider the sources from which a return for the past and proposed outlay may be derived. Probable cost of the
scheme.

First, the cost. The following is a statement of all the estimates, as prepared by the company's engineers towards the close of last year, and lately submitted in abstract to the Government of India, and as they have now been revised according to the departmental forms. These include all the works which have hitherto received the sanction of the Bengal Government, and on most of which expenditure has been incurred. For all such, detailed estimates with plans accompany this report:—

Number of Estimate.	NAME OF WORK.	Amount of Original Estimate.	Amount of Revised Estimate.
		<i>Rs.</i>	<i>Rs.</i>
B.G. Estimate, No. 75 of 1869-70.	Mahanuddy Head works, consisting of the Anicut, head lock at Jobbra, head sluice to Taldundah Canal, Junction Canal, lock channel, revetment wall, and city protective works.	12,43,800	12,43,800
No. 89 of 1869-70	- Constructing a weir at Naraje across the Kutjooree, and an embankment to connect the Anicut with the city embankments.	4,52,093	4,52,093
" 78 "	- Constructing first section of the High Level Canal from the Beropa to the Brahminee, including protective bunds.	11,60,353	11,74,852
" 88, and Revised Estimate, No. 128 of 1869-70.	- Constructing an Anicut across the Beropa, including head locks and head sluices to the Kendraparah and High Level Canals.	3,12,474	3,23,587
" 129 of 1869-70	- Constructing distributaries from the first Section of the High Level Canal.	2,91,242	2,36,205
" 79 "	- Constructing second section of the High Level Canal from the Brahminee to the Byturnee, including embankments on the Byturnee and Gondonoi.	4,62,563	4,62,421
" 127 "	- Constructing distributaries from the second section of the High Level Canal.	{ 1,15,389 } 1,20,591	2,00,000
" 77 "	- Constructing third section of the High Level Canal from the Byturnee to the Salundee, including river embankments.	7,60,093	7,59,514
" 127 "	- Constructing distributaries from the above - - - -	1,00,000	1,00,000
" 87 of 1869-70, and Supplementary Estimate, No. 130 of 1869-70.	- Constructing the Kendraparah Canal from Cuttack to tide water at Marsaghai.	6,45,820	7,20,406
" 87 of 1869-70	- Constructing distributaries therefrom - - - -	3,00,000	3,00,000
" 87 "	- Constructing Mahanuddy, Noona and Chettertollah river embankments and Satbuttea and Noona Groyues.	17,561	17,561
" 87 "	- Constructing an embankment on the right bank of the River Beropa.	41,000	45,100
" 83 "	- Constructing anicuts across the Byturnee and its branch the Burrhu.	2,24,064	2,24,219
" 82 "	- Constructing anicuts across the two branches of the Brahminee -	4,94,691	4,92,042
" 76 "	- Constructing the Taldundah Canal, including locks, calingulas, syphons, escapes, and bungalows.	5,85,000	5,85,000
" 76 "	- Constructing distributaries therefrom - - - -	1,00,000	1,60,083
" 80 "	- Constructing the Machgong Canal, including locks, calingulas, syphons, escapes, and bungalows.	3,04,000	3,04,484
" 80 "	- Constructing distributaries therefrom - - - -	1,60,000	1,59,516
" 141 "	- Constructing Midnapore and Oolabarlah section of the High Level Canal, consisting of six ranges.	19,31,528	20,52,293
" 142 "	- Constructing distributaries therefrom - - - -	3,20,000	3,13,300
" 140 "	- Constructing ranges 1 and 2 of the Tidal Canal from the Huldee to the Russoolpore.	6,68,190	7,98,385
" 81 "	- Constructing permanent workshop buildings at Cuttack - -	75,772	75,772
TOTAL - - - <i>Rs.</i>		1,09,52,224	1,12,09,683

Appendix, No. 13. But of the works which have been described in this report, the following are not included in that statement. Some of these have been estimated for in detail, others, such as Nos. 4, 5, and 6, only approximately, at the rates at which similar portions of the work have already been constructed, and they are therefore probably not far out:—

	Rs.
1. Poores Series originally estimated - - - - -	6,00,000
2. Head Works across the Katjoree - - - - -	5,71,808
3. Distributaries to 2,50,000 acres at 2 rupees - - - - -	5,00,000
4. Section No. 4 of High Level Canal from the Salundee to Balasore, 58 miles, at 22,000 rupees per mile - - - - -	12,76,000
5. Distributaries therefrom to 1,53,000 at 2 rupees - - - - -	3,06,000
6. Alternative line to the coast from the Salundee to the Metaie, 12 miles, with five Locks - - - - -	2,70,000
7. Coast line from the Metaie to Balasore, 40 miles, and four Locks - - - - -	6,50,000
8. Sections 5 and 6, comprising the Subunreeka Series - - - - -	34,50,000
TOTAL - - - Rs.	76,23,608

The cost of the Subunreeka Series has been set down, according to the detailed estimate framed by the Company's engineers, less the sum of 3,50,000 rupees for permanent establishment, as that is an item which is not usually entered in departmental estimates.

The above sum of 76,23,608 rupees, when added to the estimate for the works already in progress, and which, according to the statement, amounts to 1,12,09,633 rupees, will make the estimate for the actual works of the whole scheme, exclusive of those projected for the Upper Mahanuddy Series, which are not essentially an integral portion of the Delta Project - - - - -	Rs. 1,88,33,241
To that sum, however, will have to be added the following amount:— For establishments, tools, plant, and contingencies under the Company's management, as previously shown in the statement submitted to the Government of India - - - - -	30,50,471
Also, the difference between the sums expended in India and that paid by the Secretary of State to the Irrigation Company in England, which, inclusive of the bonus of 50,000 £, appears by the deed of transfer to have been - - - - - Rs. 1,04,00,500 Deduct expended - - - - - 87,63,076	16,37,424
Establishment from January to August 1869 - - - - -	1,55,593
Value of land paid by Government, as per Controller's books, to end of August 1869 - - - - -	4,07,249
which will make the aggregate cost - - - - -	2,50,63,978
There must, however, be further added to that sum the cost of the establishments required for the supervision of the works remaining to be done. This, if assumed at 20 per cent. on the balance of the estimates above enumerated, will be as shown below.* - - - - -	26,50,000
Making the aggregate cost, inclusive of interest on capital to } 31st December 1868, say rupees 277½ lakhs - - - - - } Rs.	2,77,13,978

The balance of 1,32,48,521 rupees of the aggregate estimate for the actual works will, if the present outlay only, viz., 12 lakhs per annum, be allowed to continue, be spread over a further period of 11 years. Whether it will be desirable to protract the construction of the works over that length of time or not, is a question for the Government to determine. My own opinion is that it will prove advantageous to the State to have the works completed more rapidly.

CHAPTER VIII.

Sources of Income. The direct sources of income which may be derived by Government from the works comprised in the Orissa Scheme are:—

1. Water rates from Irrigation.
2. Tolls from Navigation.
3. Increased Custom Dues.

4. Rents

* Viz:—	Rs.
Total estimate - - - - -	1,88,33,241
Expenditure in terms of estimate to August last - - - - -	55,84,720
Balance - - - - -	1,32,48,521
Twenty per cent. on which will be in round numbers - - - - -	26,50,000

4. Rents from waste lands, which may be brought into cultivation
5. Enhanced Land Revenue from the increased value of the land and produce at the next settlement.
6. Miscellaneous, such as Plantations, Fisheries, Mill Rents, &c.

Appendix, No. 1:

The indirect returns are such as inevitably follow an increased circulation of bullion consequent on extended commercial transactions, and though they cannot be precisely calculated and separated from the general revenues, yet their contribution to the finances of the State is nevertheless very apparent.

The first and the principal source of income will be that from irrigation. The areas for which water is supplied by the respective canals which have been enumerated are as follows:—

	Acres.
Pooree District	250,000
Taldunda Canal and Branch to Machgong	155,000
Kendrapara Canal and Branches	270,000
High Level Canal, Section I.	89,000
Ditto ditto Section II.	30,000
Intermediate Tract from ditto	100,000
High Level Canal, Section III.	100,000
Ditto ditto Section IV.	153,000
Ditto ditto Sections V. and VI., Soobunreeka Series	200,000
Ditto ditto Section VII., Midnapore ditto	170,000
TOTAL	1,607,000

The acreage is calculated at two-thirds of the cultivated, or one-half the gross area, commanded by each series of canals.

The actual proportion of the whole area cultivated with rice crops is much greater; but to assume the above proportion is to keep well within the mark, and in a rice-growing country within the probable area which will eventually be irrigated regularly.

The price which is now being charged and paid for water, is Rs. 2. 8. per acre per annum, far below its actual value for even a single crop of rice, considering the enhanced price to which all food grains have advanced during the last eight years.

No account or credit is taken in the above acreage for any land cultivated with dry or spring crops; but seeing that the aggregate cold weather volume in all the rivers amounts to 5,660 cubic feet per second, and allowing only 100 acres per cubic foot, there would be an addition of 500,000 acres to the above-mentioned area. As far as my own experience and observation goes, I doubt if more than one-fourth of the area in an essentially rice-growing country is ever covered with a second crop. I do not mean of rice only, but of any other cereal.

Where, however, broad cast rice is largely cultivated, a second crop is always raised off the same ground, and there are of course localities where cotton, maize, oil-seeds, sugar-cane, tobacco, chillies, gram, and such like are sown, and on which rice is not cultivated at all. It is quite within the limits of probability that this area will eventually be found equal to one-fourth of the monsoon cultivated area, especially as the value of all such grain has doubled within the last 10 years, and therefore the value of water supplied to that area may be legitimately looked for as an additional source of revenue eventually; for the present, it is proposed to levy only a rate of Rs. 2. 8. per acre per annum, independent of what description or what number of crops are raised off the same ground; but in time, as irrigation becomes more general, and the cultivators have acquired confidence, discriminating rates for such crops as sugar-cane, plantains, and others which require water throughout the 12 months, may with propriety and justice be introduced.

Taking, however, only the area first mentioned, viz., 1,600,000 acres, and the rate of Rs. 2. 8. at present paid, the eventual revenue to be derived from irrigation may be assumed at 40 lakhs. As the whole scheme was originally based by myself on securing the main rice crop of the province grown during the monsoon, I will take no account of the cold weather cultivation: any revenue which that may yield hereafter will, of course, be so much additional gain.

The next source of revenue is that to be derived from navigation. In the Delta schemes of Southern India the revenue from this source was always disregarded, as it was considered that the income realised from irrigation sufficiently reimbursed the State, and that all the advantage afforded by cheap water transit might be reaped by the people of the district. It was, however, afterwards determined to levy navigation dues. As there are undoubtedly many objections to levying a tax on goods in transit, it was considered preferable to make every boat take out an annual license for permission to ply on the canals.

Such a measure was feasible where, from the waterways being connected with only two rivers, one of which, the Kistna, is navigable to only a very limited extent, no boats other than those which plied on those rivers could enter the canals, but in a scheme like that of Orissa, which when completed will bring the province into communication with the vast system of navigation throughout Bengal, the plan of "licenses" is not adapted, and I question if it would be practicable; moreover, the levying of tolls is well understood throughout Bengal, though it is novel to the immediate neighbourhood of Cuttack, and therefore I am of opinion it will be better to adhere to the existing practice of levying

Appendix, No. 13. tolls. The extent to which navigation will be developed, though not possible to be foretold with any exactness, can yet be approximately estimated. The very interesting memorandum lately written by Colonel Anderson shows how great a traffic has sprung up on the Godavery and Kistna Canals, which at present collect mainly the traffic of their own deltas. There will certainly be a much larger traffic on the canals in the Orissa scheme, as the rivers from the Mahanuddy northwards are all largely navigated already, and the very fact of the canals being brought into connection with the city of Calcutta and with the river system of Bengal, will at once be followed by the traders on those rivers finding their way to Orissa.

From Colonel Anderson's memorandum it appears that the traffic in the Eastern Delta canals, measuring 108 miles, which lead to the port of Cocanada amounted for the year 1867 to 10,192 boats laden and empty, and was equivalent to 4,666,833 tons through one mile. The tolls on that traffic would, at the rate of 2 pie per ton per mile, now paid along the Orissa canals, amount to 48,613 rupees, or about 450 rupees per mile per annum. The traffic along the Cocanada Canal, alone 32 miles in length, amounts to 2,669,645 tons through one mile, which at the same rate of toll would give a revenue of 27,810 rupees, equivalent to 870 rupees per mile per annum. It is estimated that 3,000 passengers also pass on each mile of that canal during the year. These, at the rate of $\frac{1}{3}$ of a pie per mile, would give 47 rupees per annum, and make the total earnings of the Cocanada Canal for the year 917 rupees per mile.

From Goods. In estimating the amount of traffic along the Cuttack and Pooree canals, that which takes place in the Eastern Delta of the Godavery may be taken as a guide, as a similar trade to the port is certain to arise.

The length of the canals in Cuttack and Pooree will be about 200 miles. The tolls on them, therefore, at 450 rupees per mile, will amount to 90,000 rupees. But for the High Level Canal, which will intercept the traffic which is now conducted in all the intermediate rivers, as well as that which comes by land from the interior, and is conveyed to the Calcutta market, and of which live cattle forms a large item, I think 200,000 tons per annum cannot but be considered as a moderate estimate. For articles which may be carried a long distance a toll of 1 pie per ton per mile will probably be found to be the limit chargeable. The revenue therefrom would, therefore, yield at the rate of 1,040 rupees per mile about 2,60,000 rupees. For the local traffic in the neighbourhood of Calcutta, such as now travels short distances, the higher toll of 2 pies per ton per mile will continue to be paid as at present, and when those portions of the canals are complete they will probably yield a revenue of about 1,00,000 rupees.

From Passengers. The passengers travelling by the canals in the Godavery and Kistna Delta are stated by Colonel Anderson to have amounted to about 17,555,480 through one mile during the year, the aggregate length of the canals being 491 miles. This gives about 100 passengers per mile per day, or 36,500 per annum, which at the rate of $\frac{1}{3}$ of a pie per head per mile would yield a revenue of 47 rupees per mile. The traffic on the Orissa canals will probably considerably exceed that rate, both on account of the crowds of pilgrims who flock to Juggernaith, and the proximity to Calcutta, to and from which there is of course a constant stream of travellers. It is estimated that 100,000 pilgrims at least traverse the Trunk-road yearly to Juggernaith. This item alone would give 550 passengers per day coming and going.

I think that 200 travellers per mile per day in addition, or 750 per day, will be within the mark. This number would at the same rate of toll yield a revenue of 370 rupees per mile, or on 300 miles, the distance from Calcutta to Pooree, 1,11,000 rupees. The probable receipts from passenger tolls over the whole 530 miles may be assumed then at 1,00,000 rupees.

Adding these sums together the revenue from navigation will probably amount to—

	Rs.
Cuttack and Pooree Canals - - - - -	90,000
High Level Canal - - - - -	2,60,000
Midnapore and Tidal - - - - -	1,00,000
From passengers over the whole of the Canals - - -	1,00,000
TOTAL per ANNUM - - Rs.	5,50,000

From Customs
Dues.

The third source of revenue, viz., customs dues, is one regarding which there can be little uncertainty. Up to this time the export and import trade can scarcely be said to have had any existence. No custom house was established at False Point till 1860-61, and therefore no returns previous to that time are available.

	1860-61.	1861-62.	1862-63.	1863-64.	1864-65.	1865-66.	1866-67.
	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.
Imports - - -	- - -	- - -	- - -	3,30,939	9,318	15,500	18,48,601
Exports - - -	67,506	2,46,568	1,78,021	1,80,942	2,56,346	62,253	—

The above is the invoice value of the articles imported and exported. Of the former, Appendix, No. 12, the imports in 1863-64 consisted almost entirely of machinery for the Irrigation Company's works, and in 1866-67, of the rice imported during the famine.

The exports consist almost entirely of rice, seeds, and hides, but, as will be observed, they are exceedingly trifling, the largest quantity exported, and which took place in 1864-65, not exceeding 3,000 tons. I remember when the value of the annual exports of the Godavery district were under 4 lakhs of rupees; I believe they have now reached 70 lakhs. I know of no reason why the trade of Orissa should not similarly increase, and the customs dues form an important item in its revenue. What the amount may reach it is of course not possible now to determine, but, at a moderate estimate, it may be taken at 1,00,000 rupees.

The fourth source of income will be rents from waste lands which may be brought under cultivation. From Waste Lands.

Of such lands there are in the Pergunnahs within the Delta—

	Jungle Waste.	Culturable Waste.	TOTAL.
In Pooree - - - - -	33,600	34,039	67,539
„ Cuttack - - - - -	35,300	45,977	81,277
„ Balasore - - - - -	60,800	53,855	114,655
TOTAL - - -	129,600	133,871	263,471

Of the above land possibly 200,000 acres may be brought under cultivation, and if only one rupee per acre be credited, the result due to the works will be an income of 2,00,000 rupees from this source.

The fifth source of revenue is the enhanced land rent that may be levied at the renewal of the settlement, consequent on the increased value of the land, and equalization of prices throughout the province, owing to the means of cheap transit, and system of inter-communications. From enhanced Land Revenue.

The average assessment per acre of the various qualities of land in the three districts now is as follows :—

	Surud Rice.	Dalwa Rice.	Two Crop Land.	Sugar-cane.	Culturable Waste.
	Rs. a. p.	Rs. a. p.	Rs. a. p.	Rs. a. p.	Rs. a. p.
Pooree - - -	1 9 -	— 12 9	1 13 -	4 15 -	— 10 1
Cuttack - - -	3 15 2	1 3 1	3 3 4	5 4 2	— 8 -
Balasore - - -	1 8 6	2 11 1	2 2 7	6 4 5	— 9 10

The average revenue of the whole of the cultivated lands paid to Government is—

	Cultivated Acreage.		Per Acre.	Culturable Acreage.		Per Acre.
		Rs.	Rs. a. p.		Rs.	Rs. a. p.
Pooree - - -	308,014	4,57,446	1 7 10	34,039	21,274	— 10 1
Cuttack - - -	561,833	6,78,862	1 3 4	45,977	22,988	— 8 -
Balasore - - -	463,816	2,72,400	— 9 7	53,855	33,678	— 9 10
TOTAL - - -	1,333,663	14,08,708		133,871	77,940	

Appendix, No. 18. How greatly the prices of all kinds of food grain have increased within the last eight years will be seen from the following Table:—

ARTICLE.	POOREE.			CUTTACK.			BALASORE.		
	Average production per Acre.	Value in		Average production per Acre.	Value in		Average production per Acre.	Value in	
		1860.	1867.		1865.	1867.		1860.	1867.
	<i>Maunds.</i>	<i>Rs. a. p.</i>	<i>Rs. a. p.</i>	<i>Maunds.</i>	<i>Rs. a. p.</i>	<i>Rs. a. p.</i>	<i>Maunds.</i>	<i>Rs. a. p.</i>	<i>Rs. a. p.</i>
1. Paddy, Dalwa -	22	11 6 9	35 10 3	25	12 - 6	37 12 -	21	8 3 -	25 4 2
Sarud -	13	6 12 -	21 1 9	19	9 2 4	28 11 2	18	7 - 4	21 10 5
Beallee -	10	5 3 1	16 2 9	13	6 4 -	19 10 2	13	5 1 2	15 10 3
2. Kullie - - -	4	8 3 4	18 8 9	6	7 - 11	23 11 6	6	11 - 6	20 13 10
3. Moong - - -	2½	5 8 11	10 8 4	3½	6 5 10	12 4 10	4	11 6 10	10 6 6
4. Urhur - - -	2½	8 - -	11 - 9	3½	7 9 4	13 4 -	-	-	-
5. Kooltee - -	4	3 7 11	10 15 9	7	5 8 8	17 11 6	3	4 - 3	8 14 2
6. Wheats - -	2½	6 4 9	11 4 3	3½	7 5 10	15 10 3	2½	8 1 9	13 10 6
7. Goor - - -	12	71 1 8	101 1 9	14	67 3 2	104 2 -	14	62 3 6	140 - -
8. Cotton - - -	2	-	16 - -	4	20 12 -	30 8 -	-	-	-
9. Tobacco - -	Bundles, 1,100	28 5 3	42 7 10	Bundles, 1,500	39 4 6	75 - -	-	-	-

With this great increase in the value of produce, and with the increased quantity, which will be raised off an acre by means of irrigation, it is evident that the enhanced revenue for which the Government may well look by the time the period of the next settlement arrives will, probably, not be less than 33 per cent. on that which is now paid in the three districts, amounting, as above shown, to a little short of 15 lakhs of rupees, so that the income derivable from this source, will probably be about 5,00,000 rupees.

The quantity of land above shown is only that subjected to a-sessment. To that has to be added the lakhraj and jagheer, which amount in—

	<i>Acres.</i>
Pooree - - - - -	72,611
Cuttack - - - - -	122,900
Balasore - - - - -	115,650
TOTAL - - - - -	311,161

as also about 200,000 acres of redeemable waste, or 511,060 acres, making a total in Orissa of 1,981,594 acres. Of the 1,600,000 acres for which water is provided by the canals, 370,000 belongs to the Burdwan Commissionership in the Midnapore and Hoogly districts, leaving 1,230,000 as the irrigable area in Orissa Proper, that is, between the Chilka Lake and the River Soobunreckha.

The above-mentioned statistics of land, and prices have been given for Orissa only, as obtained from recent investigations. I have been unable to procure similar particulars for the districts comprised within the Burdwan Commissionership.

From
Miscellaneous.

The item of miscellaneous revenue can at present only be conjectured. Inquiries have already been made relative to the sale of water to saw-mills, as also regarding fisheries, while along the Midnapore canals plantations of mulberry are likely to prove a considerable source of revenue. A sum of 50,000 rupees may safely be taken for this item.

Capital cost of
works per acre.

The above-mentioned gross expenditure of 277½ lakhs distributed over the whole irrigable area will give a capital cost of 17·32 rupees per acre, of which about 32 lakhs, or two rupees acre may be taken as the proportion due to navigation, leaving the capital cost for irrigation, &c., somewhat under 15·32 rupees per acre. This sum is considerably more than the works in Madras have cost, and which have not, I believe, exceeded 8 rupees per acre, but less than is estimated for the Soane and Damoodah, and about the same as for the Gunduck Project. I am unable to account altogether for the difference between the cost of the Orissa and Godavery works, unless it is that within the last 10 years the value of money has fallen so much. The canals in Orissa are certainly on a larger scale, especially as regards the navigation, but the requirements to be provided for are, as has been before shown, greater than those in the Godavery. The amount of drainage that has to be passed in the shape of large works is also much greater; but, as before observed, this circumstance

is not without a compensating advantage. The individual works may have been more expensively designed in some instances, and the rate of wages has been higher, especially at the Calcutta end of the works; but, on the whole, I think neither much superfluous labour nor material has been expended hitherto, and I believe the estimates for the remaining work represent adequately the probable further expenditure necessary to carry the whole scheme, as above described, to completion. Appendix, No. 13.

The indirect sources of revenue, which the general increase of prosperity will create, it is of course impossible to estimate; but without taking these into consideration, and collecting that which may be realised from the six direct sources, the eventual gross income may be assumed as follows:— Gross Income from all sources.

	Rs.
From Irrigation to 1,000,000 acres, at Rs. 2. 8. - -	40,00,000
„ Navigation over 530 miles of Canal - - -	5,50,000
„ Custom Dues on Exports and Imports - - -	1,00,000
„ Waste Lands and Rent - - - - -	2,00,000
„ Enhanced Land Revenue - - - - -	5,00,000
„ Miscellaneous - - - - -	50,000
TOTAL - - - Rs.	54,00,000

From this Sum will have to be deducted the cost of repairs and maintenance. The former may be taken at 2 per cent. on the whole capital cost, and the latter at 4 annas per acre. Assuming then that by the time the works are fully completed, the entire cost, inclusive of every item, as before explained, reaches the sum of 2,77,25,000 rupees, and that 1,000,000 acres are irrigated for the sum, the deductions to be made will be 5,54,500 for repairs, and 4,00,000 for maintenance, establishment, and so forth, or a total of 9,54,500 rupees, which would leave 44,45,500 rupees as net revenue, or about 16 per cent; or, if the item of enhanced land revenue be omitted, 14 per cent. on the gross expenditure. If the water-rate be raised, as will doubtless be the case after a few years, and if a distinct rate be levied for cold weather crops, then the returns will of course be proportionately higher.

Calcutta, 20 November 1869.

F. H. Randall, Colonel R.E.,
Chief Engineer, Bengal,
Irrigation Branch.

Act of Incorporation of East India Irrigation and Canal Company, 1861.

Contract with Secretary of State to construct Works in Orissa, 28th December 1861.

Commencement of advances on loan, 1867.

Surrender of Works, 19th May 1869.

At the commencement of 1868, the Secretary of State offered to assist the Company with a loan not exceeding 500,000 £., including the sums already advanced to them; the loan was to bear interest at 5 per cent., and whenever the amount advanced, with accumulated interest thereon, reached 100,000 £., the Company were to give their debentures, bearing interest, payable half-yearly, at 5 per cent., and repayable in six years; in default of payment of interest for six months, or of repayment of each debenture when due, the Government were to have power to take possession of the Company's works, paying to them the amount of their paid up capital. These terms not being approved by the Company, negotiations for the loan were suspended, but they were speedily followed by negotiations for the purchase of the Company's works by the Government of India.

The shares of the Company, 20 £. each, with 16 £. 10 s. paid, were quoted at 4 to 3 discount in July 1867, just before arrival of Despatch from India, recommending the purchase of the Company's works by the Government; but in December 1868, when fully paid up, they were quoted at par to 2 premium.

The Directors were,

James Thomson, Esq., Chairman.
Field Marshal Sir George Pollock.
Honourable Arthur Kinnaid.
Colonel Grimes.
Colonel Onslow.
